Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness, restlessness, or anxiety with excessive use

Mental Health: Effects on Psychiatric TreatmentConcurrent use with atomoxetine may enhance tachycardia

Index Terms(R,R)-Formoterol L-Tartrate; Arformoterol Tartrate

---

Argatroban

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Argatroban may be confused with Aggrastat®, Orgaran®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ar GA troh ban)

Pharmacologic CategoryAnticoagulant, Thrombin Inhibitor

Use: Labeled IndicationsProphylaxis or treatment of thrombosis in patients with heparin-induced thrombocytopenia (HIT); adjunct to percutaneous coronary intervention (PCI) in patients who have or are at risk of thrombosis associated with HIT

Use: Unlabeled/InvestigationalTo maintain extracorporeal circuit patency (prefilter administration) of continuous renal replacement therapy (CRRT) in critically-ill patients with HIT

Dosing: Adults

Prophylaxis of thrombosis (heparin-induced thrombocytopenia): I.V.:

Initial dose: 2 mcg/kg/minute

Maintenance dose: Patient may not be at steady-state but measure aPTT after 2 hours; adjust dose until the steady-state aPTT is 1.5-3.0 times the initial baseline value, not exceeding 100 seconds; dosage should not exceed 10 mcg/kg/minute

Note: Critically-ill patients with normal hepatic function became excessively anticoagulated with FDA-approved or lower starting doses of argatroban. Doses between 0.15-1.3 mcg/kg/minute were required to maintain aPTTs in the target range (Reichert, 2003). In a prospective observational study of critically-ill patients with MODS and suspected or proven HIT, an initial infusion dose of 0.2 mcg/kg/minute was found to be sufficient and safe in this population (Beiderlinden, 2007). Consider reducing starting dose to 0.2 mcg/kg/minute in critically-ill patients with multiple organ dysfunction (MODS) defined as a minimum number of two organ failures. Another report of a cardiac patient with anasarca secondary to acute renal failure had a reduction in argatroban clearance similar to patients with hepatic dysfunction. Reduced clearance may have been due to reduced liver perfusion (de Denus, 2003). The American College of Chest Physicians has recommended an initial infusion rate of 0.5-1.2 mcg/kg/minute for patients with heart failure, MODS, severe anasarca, or postcardiac surgery (Hirsch, 2008).

Conversion to oral anticoagulant: Because there may be a combined effect on the INR when argatroban is combined with warfarin, loading doses of warfarin should not be used. Warfarin therapy should be started at the expected daily dose.

Patients receiving ≤2 mcg/kg/minute of argatroban: Argatroban therapy can be stopped when the combined INR on warfarin and argatroban is >4; repeat INR measurement in 4-6 hours; if INR is below therapeutic level, argatroban therapy may be restarted. Repeat procedure daily until desired INR on warfarin alone is obtained.

Patients receiving >2 mcg/kg/minute of argatroban: In order to predict the INR on warfarin alone, reduce dose of argatroban to 2 mcg/kg/minute; measure INR for argatroban and warfarin 4-6 hours after dose reduction; argatroban therapy can be stopped when the combined INR on warfarin and argatroban is >4. Repeat INR measurement in 4-6 hours; if INR is below therapeutic level, argatroban therapy may be restarted. Repeat procedure daily until desired INR on warfarin alone is obtained.

Note: The American College of Chest Physicians recommends monitoring chromogenic factor X assay when transitioning from argatroban to warfarin (Hirsh, 2008). Factor X levels <45% have been associated with INR values >2 after the effects of argatroban have been eliminated (Arpino, 2005).

Prefilter administration for continuous renal replacement therapy (CRRT) in critically-ill patients with HIT (unlabeled use; Link, 2008): 0.1 – 1.5 mcg/kg/min Note: Loading dose of 100 mcg/kg was administered during clinical trial; however, this may be unnecessary.

Percutaneous coronary intervention (PCI): I.V.:

Initial: Begin infusion of 25 mcg/kg/minute and administer bolus dose of 350 mcg/kg (over 3-5 minutes). ACT should be checked 5-10 minutes after bolus infusion; proceed with procedure if ACT >300 seconds. Following initial bolus:

ACT <300 seconds: Give an additional 150 mcg/kg bolus, and increase infusion rate to 30 mcg/kg/minute (recheck ACT in 5-10 minutes)

ACT >450 seconds: Decrease infusion rate to 15 mcg/kg/minute (recheck ACT in 5-10 minutes)

Once a therapeutic ACT (300-450 seconds) is achieved, infusion should be continued at this dose for the duration of the procedure.

If dissection, impending abrupt closure, thrombus formation during PCI, or inability to achieve ACT >300 seconds: An additional bolus of 150 mcg/kg, followed by an increase in infusion rate to 40 mcg/kg/minute may be administered.

Note: Post-PCI anticoagulation, if required, may be achieved by continuing infusion at a reduced dose of 2-10 mcg/kg/minute, with close monitoring of aPTT.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Heparin-induced thrombocytopenia** (dosing based on limited data from critically-ill patients): I.V.:

Initial dose: 0.75 mcg/kg/minute

Maintenance dose: Patient may not be at steady-state but measure aPTT after 2 hours; adjust dose until the steady-state aPTT is 1.5-3.0 times the initial baseline value, not exceeding 100 seconds; dosage may be adjusted in increments of 0.1-0.25 mcg/kg/minute. **Note:** Frequent dosage adjustments may be required to maintain desired anticoagulant activity.

Dosing: Renal ImpairmentRemoval during hemodialysis and continuous venovenous hemofiltration is clinically insignificant. No dosage adjustment required.

Dosing: Hepatic ImpairmentDecreased clearance and increased elimination half-life are seen with hepatic impairment; dose should be reduced.

Children: Initial dose: 0.2 mcg/kg/minute; adjust dose in increments of ≤0.05 mcg/kg/minute

Adults: Initial dose for moderate hepatic impairment is 0.5 mcg/kg/minute. **Note:** During PCI, avoid use in patients with elevations of ALT/AST (>3 times ULN); the use of argatroban in these patients has not been evaluated.

Administration: I.V.Solution **must be diluted to 1 mg/mL** prior to administration.

StoragePrior to use, store at 15°C to 30°C (59°F to 86°F). Protect from light. The prepared solution is stable for 24 hours at 15°C to 30°C (59°F to 86°F) in ambient indoor light. Do not expose to direct sunlight. Prepared solutions that are protected from light and kept at controlled room temperature of 20°C to 25°C (68°F to 77°F) or under refrigeration at 2°C to 8°C (36°F to 46°F) are stable for up to 96 hours.

ReconstitutionMay be mixed with 0.9% sodium chloride injection, 5% dextrose injection, or lactated Ringer's injection. Do not mix with other medications. To prepare solution for I.V. administration, dilute each 250 mg vial with 250 mL of diluent. Mix by repeated inversion for one minute. Once mixed, final concentration should be 1 mg/mL. A slight but brief haziness may occur prior to mixing.

CompatibilityStable in 0.9% NS, D_5W, LR.

Y-site administration: Incompatible with other medications.

Compatibility when admixed: Incompatible with other medications.

ContraindicationsHypersensitivity to argatroban or any component of the formulation; overt major bleeding

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: The most common complication is bleeding. Certain patients are at increased risk of bleeding; risk factors include bacterial endocarditis; congenital or acquired bleeding disorders; recent puncture of large vessels or organ biopsy; recent CVA, stroke, intracerebral surgery, or other neuraxial procedure; severe uncontrolled hypertension; renal impairment; recent major surgery; recent major bleeding (intracranial, GI, intraocular, or pulmonary). Monitor for signs and symptoms of bleeding.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; may require >4 hours to achieve full reversal of argatroban's anticoagulant effect following treatment. Avoid use during PCI in patients with elevations of ALT/AST (>3 times ULN); use in these patients has not been evaluated.

Concurrent drug therapy issues:

- Parenteral anticoagulants: Discontinue all parenteral anticoagulants prior to starting therapy; allow reversal of heparin's effects before initiation.

- Thrombolytic agents: Safety and efficacy for use with thrombolytic agents has not been established.

- Warfarin: Argatroban prolongs the PT/INR. Concomitant use with warfarin will cause increased prolongation of the PT and INR greater than that of warfarin alone. If warfarin is intiated concurrently with argatroban, initial PT/INR goals while on argatroban may require modification; alternative guidelines for monitoring therapy should be followed.

Special populations:

- Critically-ill patients: Use with caution in critically-ill patients; reduced clearance may require dosage reduction.

- Pediatrics: Limited pharmacokinetic and dosing information is available following use in critically-ill children with heparin-induced thrombocytopenia.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Argatroban should be used in pregnant women only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if argatroban is excreted in human milk. Because of the serious potential of adverse effects to the nursing infant, a decision to discontinue nursing or discontinue argatroban should be considered.

Adverse ReactionsAs with all anticoagulants, bleeding is the major adverse effect of argatroban. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the intensity of anticoagulation and patient susceptibility.

>10%:

Cardiovascular: Chest pain (PCI related: <1% to 15%), hypotension (7% to 11%)

Gastrointestinal: Gastrointestinal bleed (major: <1% to 3%; minor: 3% to 14%)

Genitourinary: Genitourinary bleed and hematuria (major: <1%; minor: 2% to 12%)

1% to 10%:

Cardiovascular: Vasodilation (1% to 10%), cardiac arrest (6%), ventricular tachycardia (5%), bradycardia (5%), myocardial infarction (PCI: 4%), atrial fibrillation (3%), angina (2%), CABG-related bleeding (minor, 2%), myocardial ischemia (2%), cerebrovascular disorder (<1% to 2%), thrombosis (<1% to 2%)

Central nervous system: Fever (<1% to 7%), headache (5%), pain (5%), intracranial bleeding (1% to 4%)

Dermatologic: Skin reactions (bullous eruption, rash; 1% to <10%)

Gastrointestinal: Nausea (5% to 7%), diarrhea (6%), vomiting (4% to 6%), abdominal pain (3% to 4%)

Genitourinary: Urinary tract infection (5%)

Hematologic: Hemoglobin decreased (<2 g/dL), hematocrit decreased (minor: 2% to 10%; major: <1%)

Local: Bleeding at injection or access site (minor: 2% to 5%)

Neuromuscular & skeletal: Back pain (PCI related: 8%)

Renal: Abnormal renal function (3%)

Respiratory: Dyspnea (8% to 10%), cough (3% to 10%), hemoptysis (minor: <1% to 3%), pneumonia (3%)

Miscellaneous: Sepsis (6%), infection (4%)

<1% (Limited to important or life-threatening): Allergic reactions, GERD, limb and below-the-knee stump bleed, multisystem hemorrhage and DIC, pulmonary edema, retroperitoneal bleeding

Metabolism/Transport Effects **Substrate** of CYP3A4 (minor)

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Test Interactions PT/INR levels may become elevated in the absence of warfarin. If warfarin is started, initial PT/INR goals while on argatroban may require modification.

Monitoring Parameters Obtain baseline aPTT prior to start of therapy. Patient may not be at steady-state but check aPTT 2 hours after start of therapy to adjust dose, keeping the steady-state aPTT 1.5-3 times the initial baseline value (not exceeding 100 seconds). Monitor hemoglobin, hematocrit, signs and symptoms of bleeding.

PCI: Monitor ACT before dosing, 5-10 minutes after bolus dosing, and after any change in infusion rate and at the end of the procedure. Additional ACT assessments should be made every 20-30 minutes during extended PCI procedures.

Nursing: Physical Assessment/Monitoring Assess patient for use cautions. Assess potential for interactions with other pharmacological agents patient may be taking (especially drugs which affect platelet function or coagulation). Assess for therapeutic effectiveness according to purpose for use and adverse reactions (abnormal bleeding, GI pain, epistaxis, hematuria, irritation at infusion site) frequently during therapy. Observe bleeding precautions and teach patient interventions to reduce side effects and adverse reactions to report.

Monitoring: Lab Tests Hemoglobin, hematocrit; baseline aPTT prior to start of therapy. Patient may not be at steady-state but check aPTT 2 hours after start of therapy to adjust dose, keeping the steady-state aPTT 1.5-3 times the initial baseline value (not exceeding 100 seconds).

Patient Education This medication can only be administered by intravenous infusion and you will be monitored with blood tests during therapy. You may have a tendency to bleed easily; use electric razor, brush teeth with soft brush, floss with waxed floss, avoid all scissors or sharp instruments (knives, needles, etc), and avoid injury or bruising. Report stomach cramping or pain; dark or bloody stools; blood in urine; acute headache or confusion; respiratory difficulty; nosebleed; or bleeding from gums. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 100 mg/mL (2.5 mL) [contains dehydrated alcohol 1000 mg/mL]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Argatroban)

100 mg/mL (2.5): $1254.41

Mechanism of ActionA direct, highly-selective thrombin inhibitor. Reversibly binds to the active thrombin site of free and clot-associated thrombin. Inhibits fibrin formation; activation of coagulation factors V, VIII, and XIII; activation of protein C; and platelet aggregation.

Pharmacodynamics/Kinetics

Onset of action: Immediate

Distribution: 174 mL/kg

Protein binding: Albumin: 20%; α_1-acid glycoprotein: 35%

Metabolism: Hepatic via hydroxylation and aromatization. Metabolism via CYP3A4/5 to four known metabolites plays a minor role. Unchanged argatroban is the major plasma component. Plasma concentration of metabolite M1 is 0% to 20% of the parent drug and is three- to fivefold weaker.

Half-life elimination: 39-51 minutes; Hepatic impairment: ≤181 minutes

Time to peak: Steady-state: 1-3 hours

Excretion: Feces (65%); urine (22%); low quantities of metabolites M2-4 in urine

Clearance is decreased in critically-ill pediatric patients

Pharmacotherapy PearlsPlatelet counts recovered by day 3 in 53% of patients with heparin-induced thrombocytopenia and in 58% of patients with heparin-induced thrombocytopenia with thrombosis syndrome.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: As with all anticoagulants, bleeding is a potential adverse effect of argatroban during dental surgery; risk is dependent on multiple variables, including the intensity of anticoagulation and patient susceptibility. Medical consult is suggested. It is unlikely that ambulatory patients presenting for dental treatment will be taking intravenous anticoagulant therapy.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsArgatroban achieves steady state rapidly (4-5 hours after initiating therapy) when administered I.V., with a predictable dose-response effect. PTTs generally remain stable at a given dose. Argatroban does not induce formation of antibodies that can alter its clearance, as is seen with lepirudin. Patients with a reduced cardiac output and/or fluid overload may require a reduced dose. Reduced clearance may be attributed to hepatic congestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsArgatroban achieves steady state rapidly (4-5 hours after initiating therapy) when administered I.V., with a predictable dose-response effect. PTTs generally remain stable at a given dose. Argatroban does not induce formation of antibodies that can alter its clearance, as is seen with lepirudin. Reduce dose in critically-ill patients, particularly those who may have multiple organ dysfunction (especially hepatic dysfunction).

International Brand NamesArgatra (DE); Novastan (CL, DK, JP, KP, NO, SE)

Arginine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(AR ji neen)

U.S. Brand NamesR-Gene®

Pharmacologic CategoryDiagnostic Agent

Use: Labeled IndicationsPituitary function test (growth hormone)

Use: Unlabeled/InvestigationalManagement of severe, uncompensated, metabolic alkalosis (pH ≥7.55) **after** optimizing therapy with sodium and potassium supplements

Dosing: AdultsPituitary function test: I.V.: 30 g (300 mL) administered over 30 minutes

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricPituitary function test: I.V.: 500 mg/kg/dose administered over 30 minutes

Dietary ConsiderationsContains chloride 0.475 mEq/mL.

StorageStore at room temperature of 25°C (77°F). Do not use if frozen.

ContraindicationsHypersensitivity to arginine or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Electrolyte imbalance: Arginine infusion has been associated with acute electrolyte disturbances, including hyperkalemia, hyponatremia (following overdose), hypophosphatemia, and acidosis; risk is increased in patients with hepatic impairment, renal dysfunction, or diabetes mellitus.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; use may lead to life-threatening hyperkalemia.
- Electrolyte imbalance: Use with caution in patients with electrolyte imbalance.
- Hepatic impairment: Use with caution in patients with hepatic impairment; use may lead to life-threatening hyperkalemia.
- Myocardial infarction: Avoid use in myocardial infarction.
- Renal impairment: Use with caution in patients with renal impairment; use may lead to life-threatening hyperkalemia.

Special populations:

- Pediatrics: Use with caution in children.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; however, the manufacturer does not recommend use of arginine during pregnancy.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsAmino acids are excreted in breast milk, the amount following arginine administration is not known.

Adverse Reactions

1% to 10%:

Cardiovascular: Rapid I.V. infusion may produce flushing

Central nervous system: Headache

Gastrointestinal: Nausea, vomiting

Local: Venous irritation

Neuromuscular & skeletal: Numbness

<1%: Allergic reaction

Postmarketing and/or case reports: Hyperkalemia

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersMonitor acid-base status (arterial or capillary blood gases), serum electrolytes (sodium, potassium, chloride, HCO_3^-), BUN, glucose

Monitoring: Lab TestsMonitor acid-base status (arterial or capillary blood gases), serum electrolytes (sodium, potassium, chloride, HCO_3^{--}), BUN, glucose

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride:

R-Gene®: 10% (300 mL) [100 mg/mL = 950 mOsm/L; contains chloride 0.475 mEq/mL]

Generic AvailableNo

Mechanism of ActionStimulates pituitary release of growth hormone and prolactin through origins in the hypothalamus; patients with impaired pituitary function have lower or no increase in plasma concentrations of growth hormone after administration of arginine. Arginine hydrochloride has been used for severe metabolic alkalosis due to its high chloride content.

Arginine hydrochloride has been used investigationally to treat metabolic alkalosis. Arginine contains 475 mEq of hydrogen ions and 475 mEq of chloride ions/L. Arginine is metabolized by the liver to produce hydrogen ions. It may be used in patients with relative hepatic insufficiency because arginine combines with ammonia in the body to produce urea.

Pharmacodynamics/Kinetics

Absorption: Oral: Well absorbed

Time to peak, serum: Oral: ~2 hours; I.V.: 20-30 minutes

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsRecently, the use of **L-arginine** to improve endothelial function has been the focus of many research protocols. L-arginine acts as a substrate for nitric oxide production, resulting in vasodilation effects.

A recent single-center, randomized, double-blind study (VINTAGE MI) determined whether the addition of L-arginine to standard post-MI therapy improved ejection fraction over 6 months (Schulman, 2006). One hundred and fifty-three patients were enrolled after STEMI. Patients were randomized to oral L-arginine (titrated to 3 g three times/day for 6 months) or placebo. Baseline characteristics, vascular stiffness measurements, and left ventricular function were similar in both groups at time of enrollment and 6 months after treatment. Mortality was significantly higher in the L-arginine group. The authors concluded that arginine should not be recommended following acute MI.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Medication Safety Issues

Sound-alike/look-alike issues:

Aripiprazole may be confused with proton pump inhibitors (eg, rabeprazole)

Pronunciation(ay ri PIP ray zole)

U.S. Brand NamesAbilify®; Abilify® Discmelt™

Pharmacologic CategoryAntipsychotic Agent, Atypical

Use: Labeled Indications

Oral: Acute and maintenance treatment of schizophrenia; stabilization, maintenance, and adjunctive therapy (to lithium or valproate) of bipolar disorder (with acute manic or mixed episodes); adjunctive treatment of major depressive disorder

Injection: Agitation associated with schizophrenia or bipolar mania

Use: Unlabeled/InvestigationalDepression with psychotic features; aggression (children); conduct disorder (children); Tourette syndrome (children); psychosis/agitation related to Alzheimer's dementia

Dosing: Adults**Note:** Oral solution may be substituted for the oral tablet on a mg-per-mg basis, up to 25 mg. Patients receiving 30 mg tablets should be given 25 mg oral solution. Orally disintegrating tablets (Abilify® Discmelt™) are bioequivalent to the immediate release tablets

(Abilify®).

Acute agitation (schizophrenia/bipolar mania): I.M.: 9.75 mg as a single dose (range: 5.25-15 mg); repeated doses may be given at ≥2-hour intervals to a maximum of 30 mg/day. **Note:** If ongoing therapy with aripiprazole is necessary, transition to oral therapy as soon as possible.

Bipolar disorder (acute manic or mixed episodes):

Stabilization: Oral: Initial: 15 mg once daily as monotherapy or adjunctive to lithium or valproic acid. May increase to 30 mg once daily if clinically indicated; safety of doses >30 mg/day has not been evaluated

Maintenance: Continue stabilization dose for up to 6 weeks; efficacy of continued treatment >6 weeks has not been established.

Depression (adjunctive with antidepressants): Oral: Initial: 2-5 mg/day (range: 2-15 mg/day); dose adjustments of up to 5 mg/day may be made in intervals of ≥1 week. **Note:** Dosing based on patients already receiving antidepressant therapy.

Schizophrenia: Oral: 10-15 mg once daily; may be increased to a maximum of 30 mg once daily (efficacy at dosages above 10-15 mg has not been shown to be increased). Dosage titration should not be more frequent than every 2 weeks.

Dosage adjustment with concurrent CYP450 inducer or inhibitor therapy: Oral:

CYP3A4 inducers (eg, carbamazepine): Aripiprazole dose should be doubled (20-30 mg/day); dose should be subsequently reduced (10-15 mg/day) if concurrent inducer agent discontinued.

CYP3A4 inhibitors (eg, ketoconazole): Aripiprazole dose should be reduced to $^{1}/_{2}$ of the usual dose, and proportionally increased upon discontinuation of the inhibitor agent.

CYP2D6 inhibitors (eg, fluoxetine, paroxetine): Aripiprazole dose should be reduced to $^{1}/_{2}$ of the usual dose, and proportionally increased upon discontinuation of the inhibitor agent.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Aggression, conduct disorder, Tourette syndrome (unlabeled uses): Oral: 5-20 mg/day

Bipolar I disorder (acute manic or mixed episodes): Children ≥10 years: Oral: Initial: 2 mg daily for 2 days, followed by 5 mg daily for 2 days with a further increase to target dose of 10 mg daily as monotherapy or adjunctive therapy; subsequent dose increases may be made in 5 mg increments, up to a maximum of 30 mg/day.

Schizophrenia: Adolescents ≥13 years: Oral: Initial: 2 mg daily for 2 days, followed by 5 mg daily for 2 days with a further increase to target dose of 10 mg daily; subsequent dose increases may be made in 5 mg increments up to a maximum of 30 mg/day (30 mg/day not shown to be more efficacious than 10 mg/day).

Dosing: Renal ImpairmentNo dosage adjustment required.
Dosing: Hepatic ImpairmentNo dosage adjustment required.
Administration: I.M.For I.M. use only; do not administer SubQ or I.V.; inject slowly into deep muscle mass
Administration: OralMay be administered with or without food. Tablet and oral solution may be interchanged on a mg-per-mg basis, up to 25 mg. Doses using 30 mg tablets should be exchanged for 25 mg oral solution. Orally disintegrating tablets (Abilify® Discmelt™) are bioequivalent to the immediate release tablets (Abilify®).

Orally-disintegrating tablet: Remove from foil blister by peeling back (do not push tablet through the foil). Place tablet in mouth immediately upon removal. Tablet dissolves rapidly in saliva and may be swallowed without liquid. If needed, can be taken with liquid. Do not split tablet.

Dietary ConsiderationsMay be taken with or without food. Oral solution contains sucrose 400 mg/mL and fructose 200 mg/mL. Orally disintegrating tablet contains phenylalanine; avoid use in phenylketonuria.
Storage

Injection solution: Store at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light.

Oral solution: Store at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Use within 6 months after opening.

Tablet: Store at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.
ContraindicationsHypersensitivity to aripiprazole or any component of the formulation
Warnings/Precautions

Boxed warnings:

- Dementia: See “Disease-related concerns” below.
- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient's family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Aripiprazole is not FDA approved for adjunctive treatment of depression in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy. Patients should be screened for bipolar disorder prior to initiation of treatment of major depression.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

Concerns related to adverse reactions:

- Altered cardiac conduction: May alter cardiac conduction; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (eg, Alzheimer's disease).

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is generally much lower relative to typical/conventional antipsychotics; frequencies reported are similar to placebo). Risk of dystonia (and probably other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Hyperglycemia: Atypical antipsychotics have been associated with development of hyperglycemia; in some cases, may be extreme and associated with ketoacidosis, hyperosmolar coma, or death. Use with caution in patients with diabetes or other disorders of glucose regulation; monitor for worsening of glucose control. Reports of hyperglycemia with aripiprazole therapy have been few and specific risk associated with this agent is not known.

- Neuroleptic malignant syndrome (NMS): Use may be associated with neuroleptic malignant syndrome (NMS); monitor for mental status changes, fever, muscle rigidity and/or autonomic instability.

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

- Weight gain: Significant weight gain has been observed with antipsychotic therapy; incidence varies with product. Monitor waist circumference and BMI.

Disease-related concerns:

- Cardiac disease: Use with caution in patients with cardiac disease, cerebrovascular disease, or conditions which predispose to hypotension.

- Dementia: **[U.S. Boxed Warning]: Elderly patients with dementia-related psychosis treated with atypical antipsychotics are at an increased risk of death compared to placebo.** An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Aripiprazole is not approved for this indication.

- Parkinson's disease: Use with caution in patients with Parkinson's disease.

- Seizures: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold. Elderly patients may be at increased risk of seizures due to an increased prevalence of predisposing factors.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <10 years of age.

Dosage form specific issues:

- Phenylalanine: Abilify® Discmelt™ contains phenylalanine.

Geriatric ConsiderationsElderly patients have an increased risk of adverse response to side effects or adverse reactions to antipsychotics. Aripiprazole has been studied in elderly patients with psychosis associated with Alzheimer's disease. The package insert does not provide the outcomes of this study other than somnolence was more frequent with aripiprazole (8%) than placebo (1%). Clinical data have shown an increased incidence of serious cerebrovascular events in the elderly, some fatal. In light of significant risks and adverse effects in the elderly population (compared with limited data demonstrating efficacy in the treatment of dementia-related psychosis, aggression, and agitation), an extensive risk:benefit analysis should be performed prior to use. Aripiprazole's delayed onset of action and long half-life may limit its role in treating older persons with psychosis. Not approved for the treatment of patients with dementia-related psychosis.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAripiprazole demonstrated developmental toxicity and teratogenic effects in animal models. There are no adequate and well-controlled trials in pregnant women. Should be used in pregnancy only when potential benefit to mother outweighs possible risk to the fetus. Healthcare providers are encouraged to enroll women 18-45 years of age exposed to aripiprazole during pregnancy in the Atypical Antipsychotics Pregnancy Registry (1-866-961-2388).

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsUnless otherwise noted, frequency of adverse reactions is shown as reported for adult patients receiving oral administration. Spectrum and incidence of adverse effects similar in children; exceptions noted when incidence much higher in children.

>10%:

Central nervous system: Headache (27%; children 16%; injection 12%), agitation (19%), insomnia (18%), anxiety (17%), akathisia (10% to 13%; injection 2%), lightheadedness (11%)

Gastrointestinal: Weight gain (8% to 30%; highest frequency in patients with BMI <23; children 3%), nausea (15%; injection 9%), dyspepsia (9% to 15%; injection 1%), constipation (11% to 13%), vomiting (11%; injection 3%)

1% to 10%:

Cardiovascular: Orthostatic hypotension (1% to 5%), tachycardia (injection 2%), chest pain, hypertension, peripheral edema

Central nervous system: Dizziness (10%; children 5%; injection 8%), sedation (dose-related 5% to 8%; children 20% to 23%; injection: 7%), EPS (5% to 6%; children 19% to 20%), restlessness (5% to 6%), fatigue (6%; children 7% to 11%), pain (3%), dystonia (children 2%), irritability, suicidal ideation

Dermatologic: Rash

Gastrointestinal: Salivation increased (children 4% to 8%), xerostomia (5%; children 2%; injection 1%), toothache (4%), abdominal discomfort (3%), diarrhea (children 3%), weight loss

Neuromuscular & skeletal: Tremor (5% to 9%), weakness (8%), arthralgia (5%; children 2%), extremity pain (4%), stiffness (4%), myalgia (2% to 4%), spasm (2%)

Ocular: Blurred vision (3%; children 5% to 8%)

Respiratory: Pharyngolaryngeal pain (3%), cough (3%), nasal congestion

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Aggression, agitation, agranulocytosis, alopecia, akinesia, amenorrhea, anaphylactic reaction, anger, angina pectoris, angioedema, anorexia, anorgasmia, asphyxia, aspiration pneumonia, atrial fibrillation, atrial flutter, atrioventricular block, bilirubin increased, bradycardia, bradykinesia, breast pain, bundle branch block, cardiopulmonary failure, cardiorespiratory arrest, catatonia, cerebrovascular accident, cholelithiasis, choreoathetosis, cogwheel rigidity, complete atrioventricular block, creatine phosphokinase increased, creatinine increased, deep vein thrombosis, delirium, diplopia, diabetes mellitus, DKA, dysphagia, dyspnea, edema (facial), erectile dysfunction, esophagitis, extrasystoles, galactorrhea, gastrointestinal hemorrhage, GGT increased, glycosylated hemoglobin increased, gynecomastia, heat stroke, hepatic enzyme increased, hepatitis, homicidal ideation, hostility, hyper-/hypoglycemia, hyperlipidemia, hypersensitivity, hyper-/hypotonia, hypotension, hypokalemia, hypokinesia, hyponatremia, hypothermia cholecystitis, idiopathic thrombocytopenic purpura, intentional self injury, jaundice, lactate dehydrogenase increased, leukopenia, libido changes, memory impairment, menstrual irregularities, MI, muscle rigidity, muscle spasms, myocardial ischemia, myoclonus, neutropenia, nocturia, oropharyngeal spasm, palpitation, pancreatitis, parkinsonism, phlebitis, photophobia, polydypsia, polyuria, priapism, prolactin increased, pruritus, psychomotor agitation, pulmonary embolism, QT_c prolonged, respiratory distress, rhabdomyolysis, seizure (grand mal), shock, speech disorder, suicide, suicide attempt, supraventricular tachycardia, swollen tongue, tardive dyskinesia, thrombocytopenia, thrombophlebitis, tic, ulcer, urea increased, urinary retention, urticaria, ventricular tachycardia

Metabolism/Transport Effects**Substrate** (major) of CYP2D6, 3A4

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Atypical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

CarBAMazepine: May decrease the serum concentration of Aripiprazole. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Ingestion with a high-fat meal delays time to peak plasma level.

Herb/Nutraceutical: St John's wort may decrease aripiprazole levels. Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Monitoring ParametersVital signs; fasting lipid profile and fasting blood glucose/Hb A_{1c} (prior to treatment, at 3 months, then annually); BMI, personal/family history of diabetes, waist circumference, blood pressure, mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms (EPS). Weight should be assessed prior to treatment, at 4 weeks, 8 weeks, 12 weeks, and then at quarterly intervals. Consider titrating to a different antipsychotic agent for a weight gain ≥5% of the initial weight.

Nursing: Physical Assessment/MonitoringAssess personal/family history of diabetes vital signs, blood pressure; mental status, thoughts of suicide ideation, abnormal involuntary movement scale (AIMS), and extrapyramidal symptoms (EPS). Weight and waist circumference should be assessed prior to treatment, at 4 weeks, 8 weeks, 12 weeks, and then at quarterly intervals. Consider titrating to a different antipsychotic agent for a weight gain ≥5% of the initial weight. This drug may alter glucose regulation and control. Monitor closely. Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests (eg, ophthalmic, hematological, cardiovascular) prior to and periodically during therapy. Assess therapeutic effectiveness and adverse response (eg, extrapyramidal symptoms, neuroleptic malignant syndrome) at beginning of and at regular intervals during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsFasting lipid profile and fasting blood glucose/Hb A_{1c} (prior to treatment, at 3 months, then annually); BMI

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take exactly as directed at the same time of day, without regard to meals. Do not alter dose; it may take some time to achieve desired results. Avoid alcohol. If you have diabetes, monitor blood glucose levels closely at beginning of therapy and periodically thereafter. May cause hyperglycemia. You may be more vulnerable to overheating and dehydration while taking this medication. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. May cause headache, dizziness, lightheadedness, problems sleeping, anxiety (use caution when driving or engaged in potentially hazardous tasks until response to drug is known), nausea or vomiting (small frequent meals and frequent mouth care may help), constipation (increased fluids, fiber, fruit, and exercise may help) or orthostatic hypotension (use caution when changing position from lying or sitting to standing and when climbing stairs). Report chest pain or palpitations; persistent gastrointestinal effects; muscle or skeletal pain, weakness, cramping, or tremors; involuntary movements, altered gait; change in vision; change in mental status (especially suicide ideation); weight gain or loss; or respiratory changes or flu-like symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Abilify®: 7.5 mg/mL (1.3 mL)

Solution, oral:

Abilify®: 1 mg/mL (150 mL) [contains propylene glycol, sucrose 400 mg/mL, and fructose 200 mg/mL; orange cream flavor]

Tablet:

Abilify®: 2 mg, 5 mg, 10 mg, 15 mg, 20 mg, 30 mg

Tablet, orally disintegrating:

Abilify® Discmelt™: 10 mg [contains phenylalanine 1.12 mg; creme de vanilla flavor]; 15 mg [contains phenylalanine 1.68 mg; creme de vanilla flavor]

Generic AvailableNo

ManufacturerBristol-Myers Squibb Co

Pricing: U.S. (www.drugstore.com)

Tablet, orally-disintegrating (Abilify Discmelt)

10 mg (30): $449.97

Tablets (Abilify)

2 mg (30): $373.06

5 mg (30): $374.11

10 mg (30): $369.87

15 mg (30): $375.98

20 mg (30): $508.82

30 mg (30): $508.82

Mechanism of ActionAripiprazole is a quinolinone antipsychotic which exhibits high affinity for D_2, D_3, 5-HT_{1A}, and 5-HT_{2A} receptors; moderate affinity for D_4, 5-HT_{2C}, 5-HT_7, alpha_1 adrenergic, and H_1 receptors. It also possesses moderate affinity for the serotonin reuptake transporter; has no affinity for muscarinic (cholinergic) receptors. Aripiprazole functions as a partial agonist at the D_2 and 5-HT_{1A} receptors, and as an antagonist at the 5-HT_{2A} receptor.

Pharmacodynamics/Kinetics

Onset: Initial: 1-3 weeks

Absorption: Well absorbed

Distribution: V_d: 4.9 L/kg

Protein binding: ≥99%, primarily to albumin

Metabolism: Hepatic, via CYP2D6, CYP3A4 (dehydro-aripiprazole metabolite has affinity for D_2 receptors similar to the parent drug and represents 40% of the parent drug exposure in plasma)

Bioavailability: I.M.: 100%; Tablet: 87%

Half-life elimination: Aripiprazole: 75 hours; dehydro-aripiprazole: 94 hours

CYP2D6 poor metabolizers: Aripiprazole: 146 hours

Time to peak, plasma: I.M.: 1-3 hours; Tablet: 3-5 hours

With high-fat meal: Aripiprazole: Delayed by 3 hours; dehydro-aripiprazole: Delayed by 12 hours

Excretion: Feces (55%, ~18% unchanged drug); urine (25%, <1% unchanged drug)

Dental Health Professional ConsiderationsAripiprazole works differently from the classic antipsychotics, such as chlorpromazine, in that it does not appear to block central dopaminergic receptors, but rather seems to be a stabilizer of dopamine-serotonin central systems. The risk of extrapyramidal reactions such as pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia are low and the frequencies reported are similar to placebo. Aripiprazole may be associated with neuroleptic malignant syndrome (NMS).

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Extrapyramidal symptoms (similar to placebo) (see Dental Comment); xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentAripiprazole is an antipsychotic agent of a class often referred to as atypical. Some have referred to this agent as a new generation agent since its pharmacology differs (partial dopamine agonist) from the other atypical agents. It should be noted that the definition of the term “atypical” is not universally agreed upon. Some prefer to describe antipsychotics based on their pharmacological properties. A common feature of all definitions used to describe “atypical” antipsychotics is the lack of significant acute or subacute EPS, at dosages generally associated with antipsychotic actions. Other experts have included definitions of atypicality that include a) failure to increase serum prolactin levels; b) superior efficacy for positive, negative, and cognitive symptoms; and c) lack of evidence of tardive dyskinesia or dystonia following chronic administration. Clinically, if a patient with schizophrenia is not doing well on a particular dose, it is not clear whether the dose should be increased or decreased (15 mg/day dose did not differ from 30 mg/day dose in schizophrenia clinical trials). It is helpful, however, for patients with significant GI side effects to lower the dose and wait for tolerance to develop before going to a higher dose. While the dose for individuals with bipolar is similar to those with schizophrenia (15-30 mg/day) when used as an adjunctive agent for the management of depression the dose is 2-15 mg/day.

The short-acting I.M. formulation appears to be as efficacious as other available agents for the management of acute agitation; however, comparative trials have not been conducted.

Tardive dyskinesia (TD) secondary to **typical** antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. The incidence of TD associated with the atypical antipsychotics is estimated to be 0.5% to 1%. It is not clear if this estimate represents a risk associated with mental illness or to what extent drug therapy can be implicated. Atypical antipsychotics appear less likely to cause tardive dyskinesia than typical antipsychotics (fluphenazine, haloperidol).

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Armodafinil

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ar moe DAF i nil)

U.S. Brand NamesNuvigil™

Pharmacologic CategoryStimulant

Use: Labeled IndicationsImprove wakefulness in patients with excessive daytime sleepiness associated with narcolepsy and shift work sleep disorder (SWSD); adjunctive therapy for obstructive sleep apnea/hypopnea syndrome (OSAHS)

Dosing: Adults

Narcolepsy: Oral: 150-250 mg once daily in the morning

Obstructive sleep apnea/hypopnea syndrome (OSAHS): Oral: 150-250 mg once daily in the morning; 250 mg was not shown to have any increased benefit over 150 mg

Shift work sleep disorder (SWSD): Oral: 150 mg given once daily ~1 hour prior to work shift

Dosing: ElderlyRefer to adult dosing. Consider lower initial dosage. Concentrations were almost doubled in clinical trials (based on modafinil).

Dosing: PediatricNot approved for use in children.

Dosing: Renal ImpairmentInadequate data to determine safety and efficacy in severe renal impairment.

Dosing: Hepatic ImpairmentSevere hepatic impairment (Child-Pugh classes B and C): Based on modafinil, dose should be reduced by half.

Administration: OralMay be administered without regard to food.

Dietary ConsiderationsTake with or without meals.

StorageStore at 20°C to 25°C (68°F to 77°F).

RestrictionsC-IV

ContraindicationsHypersensitivity to armodafinil, modafinil, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Dermatologic effects (severe): Serious and life-threatening rashes including Stevens-Johnson Syndrome, toxic epidermal necrolysis, and drug rash with eosinophilia and systemic symptoms have been reported with modafinil, the racemate of armodafinil. In clinical trials of modafinil, these rashes were more likely to occur in children; however, in the postmarketing period, serious reactions have occurred in both adults and children. Most cases have been reported within the first 5 weeks of initiating therapy; however, rare cases have occurred after prolonged therapy. No risk factors have been identified to predict occurrence or severity of these reactions. Patients should be advised to discontinue drug at first sign of rash.

- Hypersensitivity reactions: Rare cases of multiorgan hypersensitivity reactions in association with modafinil and cases of angioedema and anaphylactoid reactions have been reported with the use of armodafinil. Signs and symptoms of multiorgan hypersensitivity reactions are diverse. Patients typically present with fever and rash associated with other organ system involvement. Patients should be advised to discontinue therapy and promptly report any signs or symptoms related to these adverse effects.

Disease-related concerns:

- Cardiovascular disease: Use is not recommended in patients with a history of left ventricular hypertrophy or patients with mitral valve prolapse who have developed mitral valve prolapse syndrome with previous CNS stimulant use. Patients with these conditions may also experience chest pain, palpitations, dyspnea, and transient ischemic T-wave changes on ECG. Due to limited experience use caution in patients with history of myocardial infarction (MI), angina, or hypertension. Blood pressure monitoring may be required in patients on armodafinil. New or additional antihypertensive therapy may be needed.

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage reduction is recommended with severe dysfunction.

- Psychiatric disorders: Use caution in patients with a history of psychosis, depression, or mania. Modafinil has been shown to worsen the symptoms of these diseases (eg, mania, hallucinations, suicidal thoughts).

- Renal impairment: Safety and efficacy have not been established with severe renal impairment.

- Sleep disorders: Appropriate use: For use following complete evaluation of sleepiness and in conjunction with other standard treatments (eg, CPAP). The degree of sleepiness should be reassessed frequently; some patients may not return to a normal level of wakefulness. Patients with excessive sleepiness should be advised to avoid driving or any other potentially dangerous activity.

- Tourette's syndrome: Use with caution in patients with Tourette's syndrome; stimulants may unmask tics.

Special populations:

- Elderly: Use reduced doses in elderly patients; concentrations of armodafinil are significantly higher in patients >65 years of age.

- Pediatrics: Safety and efficacy have not been established in children <17 years of age.

Other warnings/precautions:

- Abuse potential: Use with caution in patients with a history of drug abuse; potential for drug dependency exists.

Geriatric ConsiderationsThere are no specific pharmacokinetic data for armodafinil, but the clearance of modafinil may be reduced in the elderly. Safety and effectiveness in persons >65 years of age have not been established.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no well-controlled studies of armodafinil in pregnant women. There have been reports of intrauterine growth retardation and spontaneous abortions in women using the both armodafinil and modafinil, but relationship to the drug is unknown.

Adverse events have been observed in animal studies. Armodafinil and modafinil have been studied in both rats and rabbits. Developmental toxicity (including visceral and skeletal abnormalities and decreased fetal weight) in rats (armodafinil and modafinil) and rabbits (modafinil) has been observed at doses correlating to those used clinically. Efficacy of steroidal contraceptives may be decreased; alternate means of contraception should be considered during therapy and for 1 month after modafinil is discontinued.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Central nervous system: Headache (14% to 23%; dose related)

1% to 10%:

Cardiovascular: Palpitation (2%), increased heart rate (1%)

Central nervous system: Dizziness (5%), insomnia (4% to 6%; dose related), anxiety (4%), depression (1% to 3%; dose related), fatigue (2%), agitation (1%), attention disturbance (1%), depressed mood (1%), migraine (1%), nervousness (1%), pain (1%), pyrexia (1%), tremor (1%)

Dermatologic: Rash (1% to 4%; dose related), contact dermatitis (1%), hyperhidrosis (1%)

Gastrointestinal: Nausea (6% to 9%; dose related), xerostomia (2% to 7%; dose related), diarrhea (4%), abdominal pain (2%), dyspepsia (2%), anorexia (1%), appetite decreased (1%), constipation (1%), loose stools (1%), vomiting (1%)

Genitourinary: Polyuria (1%)

Hepatic: GGT increased (1%)

Neuromuscular & skeletal: Paresthesia (1%)

Respiratory: Dyspnea (1%)

Miscellaneous: Flu-like syndrome (1%), thirst (1%)

Postmarketing and/or case reports: Anaphylactoid reaction, angioedema, hypersensitivity, liver enzymes increased, pancytopenia, systolic blood pressure increased

Metabolism/Transport Effects

Substrate of CYP3A4 (major); **Inhibits** CYP2C19 (moderate); **Induces** CYP1A2 (weak), 3A4 (moderate)

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Armodafinil may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol.

Food: Delays absorption, but minimal effects on bioavailability. Food may affect the onset and time course of armodafinil.

Monitoring ParametersSigns of hypersensitivity, rash, psychiatric symptoms, levels of sleepiness, blood pressure, and drug abuse

Nursing: Physical Assessment/MonitoringMonitor therapeutic response, adverse reactions, and blood pressure at the beginning and periodically throughout therapy. Assess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking. Do not take any new medications without consulting prescriber. Avoid or limit alcohol. May cause headache, dizziness (use caution when driving or engaging in activities requiring alertness until response to drug is known); dry mouth (sucking on lozenges or hard candy may help), or nausea (small, frequent meals, frequent oral care, sucking lozenges, or chewing gum may help). Report mental disturbances, persistent insomnia or headaches, rash, or heart disturbances including chest pain. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Nuvigil™: 50 mg, 150 mg, 250 mg

Generic AvailableNo

ManufacturerCephalon, Inc

Mechanism of ActionThe exact mechanism of action of armodafinil is unknown. It is the R-enantiomer of modafinil. Armodafinil binds to the dopamine transporter and inhibits dopamine reuptake, which may result in increased extracellular dopamine levels in the brain. However, it does not appear to be a dopamine receptor agonist and also does not appear to bind to or inhibit the most common receptors or enzymes that are relevant for sleep/wake regulation.

Pharmacodynamics/Kinetics

Absorption: Readily absorbed

Distribution: V_d: 42 L

Protein binding: ~60% (based on modafinil; primarily albumin)

Metabolism: Hepatic, multiple pathways, including CYP3A4/5; metabolites include R-modafinil acid and modafinil sulfone

Clearance: 33 mL/minute, mainly via hepatic metabolism

Half-life elimination: 15 hours; Steady state: ~7 days

Time to peak, plasma: 2 hours (fasted)

Excretion: Urine (80% predominantly as metabolites; <10% as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse vasoconstrictor with caution. Patients may experience heart palpitations and increased heart rate when taking armodafinil.

Mental Health CommentArmodafinil is a stimulant and has been shown to worsen symptoms of psychosis (hallucinations), depression (suicidal thoughts), and mania in some vulnerable patients. Patients with bipolar disorder should not receive stimulant medication in the absence of treatment with a concomitant mood-stabilizing medication. Stimulants may also unmask tics in patients with Tourette's syndrome. Armodafinil has the potential to be abused and for individuals to become dependent. Assess patients' history of drug abuse. Monitor for life-threatening rashes including Stevens-Johnson syndrome. Armodafinil uses CYP3A4 as a major metabolic pathway. Evaluate medication regimen for potential drug-drug interactions.

Index TermsR-modafinil

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(AR se nik tri OKS id)

U.S. Brand NamesTrisenox®

Pharmacologic CategoryAntineoplastic Agent, Miscellaneous

Use: Labeled IndicationsInduction of remission and consolidation in patients with relapsed or refractory acute promyelocytic leukemia (APL) which is specifically characterized by t(15;17) translocation or PML/RAR-alpha gene expression

Use: Unlabeled/InvestigationalTreatment of myelodysplastic syndrome (MDS), multiple myeloma

Dosing: Adults**APL:** I.V.:

Induction: 0.15 mg/kg/day; administer daily until bone marrow remission; maximum induction: 60 doses

Consolidation: 0.15 mg/kg/day starting 3-6 weeks after completion of induction therapy; maximum consolidation: 25 doses over 5 weeks

MDS, multiple myeloma (unlabeled uses): I.V.: 0.25 mg/kg/day 5 consecutive days/week for 2 weeks, followed by a 2-week rest period

Dosing: ElderlySafety and efficacy have not been established. Clinical trials included patients ≤72 years of age. Use with caution due to the increased risk of renal impairment in the elderly.

Dosing: Pediatric**APL:** Children ≥5 years: Refer to adult dosing.

Dosing: Renal ImpairmentSafety and efficacy have not been established; use with caution due to renal elimination.

Dosing: Hepatic ImpairmentSafety and efficacy have not been established.

Administration: I.V.I.V. infusion over 1-2 hours. If acute vasomotor reactions occur, infuse over a maximum of 4 hours. Does not require administration via a central venous catheter.

Administration: I.V. DetailpH: 7.5-8.5

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F); do not freeze. Following dilution, stable for 24 hours at room temperature or 48 hours when refrigerated.

ReconstitutionDilute in 100-250 mL D_5W or 0.9% NaCl. Discard unused portion.

ContraindicationsHypersensitivity to arsenic or any component of the formulation

Warnings/Precautions

Boxed warnings:

- APL differentiation syndrome: See “Concerns related to adverse effects” below.
- Baseline tests: See “Other warnings/precautions” below.
- Experienced physician: See “Other warnings/precautions” below.
- QT prolongation: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- APL differentiation syndrome: **[U.S. Boxed Warning]: May cause retinoic-acid-acute promyelocytic leukemia (RA-APL) syndrome or APL differentiation syndrome** (dyspnea, fever, weight gain, pulmonary infiltrates, and pleural or pericardial effusions) in patients with APL. High-dose steroids have been used for treatment.
- Hyperleukocytosis: May lead to the development of hyperleukocytosis (leukocytes ≥10,000/mm^3).
- QT prolongation: **[U.S. Boxed Warning]: May prolong the QT interval. May lead to torsade de pointes or complete AV block.** Risk factors for torsade de pointes include HF, a history of torsade de pointes, pre-existing QT interval prolongation, patients taking potassium-wasting diuretics, and conditions which cause hypokalemia or hypomagnesemia. If possible, discontinue all medications known to prolong the QT interval. Correct QT_c >500 msec prior to treatment. Discontinue therapy and hospitalize patient if QT_c >500 msec, syncope, or irregular heartbeats develop during therapy; do not reinitiate until QT_c <460 msec.

Disease-related concerns:

- Electrolyte imbalances: Correct electrolyte abnormalities prior to treatment and monitor potassium and magnesium levels during therapy (potassium should stay >4 mEq/dL and magnesium >1.8 mg/dL).

- Renal impairment: Use with caution in patients with renal impairment; arsenic is eliminated renally.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <5 years of age; limited experience with children 5-16 years of age.

Other warnings/precautions:

- Baseline tests: **[U.S. Boxed Warning]: A baseline 12-lead ECG, serum electrolytes (potassium, calcium, magnesium), and creatinine should be obtained prior to treatment.**

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsIncreased resorptions, neural-tube defects, and ophthalmic abnormalities have been observed in animal studies. Arsenic crosses the human placenta. In studies of women exposed to high levels of arsenic from drinking water, cord blood levels were similar to maternal serum levels. Dimethylarsinic acid (DMA) was the form of arsenic found in the fetus. An increased risk of low birth weight and still births were observed in women who ingested high levels of dietary arsenic. There are no studies of arsenic trioxide therapy in pregnant women. Women of childbearing potential should avoid pregnancy.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsArsenic is naturally found in breast milk; concentrations range from 0.2-6 mcg/kg. In studies of women exposed to high levels of arsenic from drinking water, breast milk concentrations were low (~3.1 mcg/kg) and did not correlate with maternal serum levels. The possible effect of maternal arsenic trioxide therapy on breast milk concentrations is not known. Due to the potential for serious adverse reactions in a nursing infant, breast-feeding during therapy is not recommended.

Adverse Reactions

>10%:

Cardiovascular: Tachycardia (55%), edema (40%), QT interval >500 msec (40%), chest pain (25%; grades 3/4: 5%), hypotension (25%; grades 3/4: 5%)

Central nervous system: Fatigue (63%), fever (63%), headache (60%), insomnia (43%), anxiety (30%), dizziness (23%), depression (20%), pain (15%)

Dermatologic: Dermatitis (43%), pruritus (33%), bruising (20%), dry skin (13%)

Endocrine & metabolic: Hypokalemia (50%; grades 3/4: 13%), hyperglycemia (45%; grades 3/4: 13%), hypomagnesemia (45%; grades 3/4: 13%), hyperkalemia (18%; grades 3/4: 5%)

Gastrointestinal: Nausea (75%), abdominal pain (58%), vomiting (58%), diarrhea (53%), sore throat (35% to 40%), constipation (28%), anorexia (23%), appetite decreased (15%), weight gain (13%)

Genitourinary: Vaginal hemorrhage (13%)

Hematologic: Leukocytosis (50%; grades 3/4: 3%), APL differentiation syndrome (23%), anemia (20%; grades 3/4: 5%), thrombocytopenia (18%; grades 3/4: 13%), febrile neutropenia (13%; grades 3/4: 8%)

Hepatic: ALT increased (20%; grades 3/4: 5%), AST increased (13%; grades 3/4: 3%)

Local: Injection site: Pain (20%), erythema (13%)

Neuromuscular & skeletal: Neuropathy (43%), rigors (38%), arthralgia (33%), paresthesia (33%), myalgia (25%), bone pain (23%), back pain (18%), limb pain (13%), neck pain (13%), tremor (13%)

Respiratory: Cough (65%), dyspnea (38% to 53%; grades 3/4: 10%), epistaxis (25%), hypoxia (23%), pleural effusion (20%), sinusitis (20%), postnasal drip (13%), upper respiratory tract infection (13%), wheezing (13%)

Miscellaneous: Herpes simplex (13%)

1% to 10%:

Cardiovascular: Hypertension (10%), flushing (10%), pallor (10%), palpitation (10%), facial edema (8%), abnormal ECG (not QT prolongation) (7%)

Central nervous system: Convulsion (8%; grades 3/4: 5%), somnolence (8%), agitation (5%), coma (5%), confusion (5%)

Dermatologic: Erythema (10%), hyperpigmentation (8%), petechia (8%), skin lesions (8%), urticaria (8%), local exfoliation (5%)

Endocrine & metabolic: Hypocalcemia (10%), hypoglycemia (8%), acidosis (5%)

Gastrointestinal: Dyspepsia (10%), loose stools (10%), abdominal distension (8%), abdominal tenderness (8%), xerostomia (8%), fecal incontinence (8%), gastrointestinal hemorrhage (8%), hemorrhagic diarrhea (8%), oral blistering (8%), weight loss (8%), oral candidiasis (5%)

Genitourinary: Intermenstrual bleeding (8%), incontinence (5%)

Hematologic: Neutropenia (10%; grades 3/4: 10%), DIC (8%), hemorrhage (8%), lymphadenopathy (8%)

Local: Injection site edema (10%)

Neuromuscular & skeletal: Weakness (10%)

Ocular: Blurred vision (10%), eye irritation (10%), dry eye (8%), eyelid edema (5%), painful eye (5%)

Otic: Earache (8%), tinnitus (5%)

Renal: Renal failure (8%; grades 3/4: 3%), renal impairment (8%), oliguria (5%)

Respiratory: Crepitations (10%), breath sounds decreased (10%), rales (10%), hemoptysis (8%), rhonchi (8%), tachypnea (8%), nasopharyngitis (5%)

Miscellaneous: Diaphoresis increased (10%), APL differentiation syndrome (8%), bacterial infection (8%), herpes zoster (8%), night sweats (8%), hypersensitivity (5%), sepsis (5%; grades 3/4: 5%)

Postmarketing and/or case reports: Atrial dysrhythmia, AV block, torsade de pointes

Oncology: VesicantNo

Oncology: Emetic PotentialModerate-to-high (30% to 90%)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid homeopathic products (arsenic is present in some homeopathic medications). Avoid hypoglycemic herbs, including alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng, gymnema, marshmallow, and stinging nettle (may enhance the hypoglycemic effect of arsenic trioxide).

Monitoring ParametersBaseline then weekly 12-lead ECG, baseline then twice weekly serum electrolytes, hematologic and coagulation profiles at least twice weekly during induction and at least weekly during consolidation; more frequent monitoring may be necessary in unstable patients

Nursing: Physical Assessment/MonitoringTo be used only by physicians experienced with the treatment of acute leukemia. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (especially anything that may cause hypokalemia or hypomagnesemia, or antiarrhythmic agents). Assess results of laboratory tests and patient response at beginning and periodically during therapy (especially cardiac and electrolyte status). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsBaseline then weekly 12-lead ECG, baseline then twice weekly serum electrolytes, hematologic and coagulation profiles at least twice weekly during induction and at least weekly during consolidation; more frequent monitoring may be necessary in unstable patients .

Patient EducationDo not take any new medication during therapy unless approved by physician. This medication can only be administered by intravenous infusion. Report immediately any redness, swelling, pain, or burning at infusion site. May cause dizziness, fatigue, blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea, vomiting, diarrhea, or decreased appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report immediately unexplained fever; respiratory difficulty; chest pain or palpitations; confusion, lightheadedness, or fainting; unusual joint, back, or muscle pain, tingling or loss of feeling; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform physician if you are pregnant. Do not get pregnant while take this medication. Consult physician for appropriate contraceptive methods. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Trisenox®: 1 mg/mL (10 mL)

Generic AvailableNo

Mechanism of ActionNot fully understood; causes *in vitro* morphological changes and DNA fragmentation to NB4 human promyelocytic leukemia cells; also damages or degrades the fusion protein PML-RAR alpha

Pharmacodynamics/Kinetics

Distribution: V_d: ~4 L

Metabolism: Hepatic; pentavalent arsenic is reduced to trivalent arsenic (active) by arsenate reductase; trivalent arsenic is methylated to monomethylarsinic acid, which is then converted to dimethylarsinic acid via methyltransferases

Half-life elimination: Initial: 0.6-1.2 hours; Elimination: 9-15 hours

Excretion: Urine (as methylated metabolite)

Pharmacotherapy PearlsArsenic is stored in liver, kidney, heart, lung, hair, and nails. Arsenic trioxide is a human carcinogen.

Oncology Comment: Arsenic trioxide is listed within National Comprehensive Cancer Network (NCCN) guidelines for the treatment of acute myeloid leukemia as the recommended salvage therapy for relapsed or persistent APL. For patients with APL in their second complete response, who are not candidates for stem cell transplant, in the absence of an appropriate clinical trial, maintenance therapy with arsenic trioxide is an option.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsArsenic trioxide is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusFatigue, insomnia, anxiety, dizziness, and depression are common; may cause agitation and confusion

Mental Health: Effects on Psychiatric TreatmentContraindicated with ziprasidone. Gastrointestinal side effects are common; may produce additive GI side effects when used in combination with SSRIs. Hypotension is common and combined use with psychotropics may produce additive hypotension. May cause thrombocytopenia and neutropenia. Use caution with clozapine, carbamazepine, and valproic acid. Concurrent use with thioridazine may increase the risk of potentially fatal arrhythmias.

Cardiovascular ConsiderationsArsenic trioxide may prolong the QT interval and cause torsade de pointes or complete AV block and, therefore, should be administered in a controlled setting with careful monitoring of blood pressure and electrocardiogram. Hypokalemia and hypomagnesemia should be corrected, if present, prior to initiation of therapy. Patients with concomitant congestive heart failure, history of torsade de pointes, long QT syndrome, and/or on other medications that prolong the QT interval may be at a greater risk for torsade de pointes.

U.S. Brand NamesSeptocaine® with epinephrine 1:100,000; Septocaine® with epinephrine 1:200,000; Zorcaine™

Canadian Brand NamesAstracaine® with epinephrine 1:200,000; Astracaine® with epinephrine forte 1:100,000; Septanest® N; Septanest® SP; Ultracaine® D-S; Ultracaine® D-S Forte; Zorcaine™

Pharmacologic CategoryLocal Anesthetic

Use: DentalLocal, infiltrative, or conductive anesthesia in both simple and complex dental and periodontal procedures

Dosing: AdultsSummary of recommended volumes and concentrations for various types of anesthetic procedures; dosages (administered by submucosal injection and/or nerve block) apply to normal healthy adults:

Infiltration: Injection volume of 4% solution: 0.5-2.5 mL; total dose: 20-100 mg

Nerve block: Injection volume of 4% solution: 0.5-3.4 mL; total dose: 20-136 mg

Oral surgery: Injection volume of 4% solution: 1-5.1 mL; total dose: 40-204 mg

Note: These dosages are guides only; other dosages may be used; however, do not exceed maximum recommended dose

Special populations: The clinician is reminded that these doses serve only as a guide to the amount of anesthetic required for most routine procedures. The actual volumes to be used depend upon a number of factors, such as type and extent of surgical procedure, depth of anesthesia, degree of muscular relaxation, and condition of the patient. In all cases, the smallest dose that will produce the desired result should be given. Dosages should be reduced for pediatric patients, elderly patients, and patients with cardiac and/or liver disease.

Maximum recommended dosages:

Adults (normal, healthy): Submucosal infiltration and/or nerve block: Not to exceed 7 mg/kg (0.175 mL/kg) **or** 3.2 mg/lb (0.0795 mL/lb) of body weight

The following numbers of dental cartridges (1.7 mL) provide the indicated amounts of articaine hydrochloride 4% and epinephrine 1:100,000:

1 cartridge provides 68 mg articaine HCl (4%) and 0.017 mg vasoconstrictor (epinephrine 1:100,000)

2 cartridges provides 136 mg articaine HCl (4%) and 0.034 mg vasoconstrictor (epinephrine 1:100,000)

3 cartridges provides 204 mg articaine HCl (4%) and 0.051 mg vasoconstrictor (epinephrine 1:100,000)

4 cartridges provides 272 mg articaine HCl (4%) and 0.068 mg vasoconstrictor (epinephrine 1:100,000)

5 cartridges provides 340 mg articaine HCl (4%) and 0.085 mg vasoconstrictor (epinephrine 1:100,000)

6 cartridges provides 408 mg articaine HCl (4%) and 0.102 mg vasoconstrictor (epinephrine 1:100,000)

7 cartridges provides 476 mg articaine HCl (4%) and 0.119 mg vasoconstrictor (epinephrine 1:100,000)

8 cartridges provides 544 mg articaine HCl (4%) and 0.136 mg vasoconstrictor (epinephrine 1:100,000)

The following numbers of dental cartridges (1.7 mL) provide the indicated amounts of articaine hydrochloride 4% and epinephrine 1:200,000:

1 cartridge provides 68 mg articaine HCl (4%) and 0.0085 mg vasoconstrictor (epinephrine 1:200,000)

2 cartridges provides 136 mg articaine HCl (4%) and 0.017 mg vasoconstrictor (epinephrine 1:200,000)

3 cartridges provides 204 mg articaine HCl (4%) and 0.026 mg vasoconstrictor (epinephrine 1:200,000)

4 cartridges provides 272 mg articaine HCl (4%) and 0.034 mg vasoconstrictor (epinephrine 1:200,000)

5 cartridges provides 340 mg articaine HCl (4%) and 0.043 mg vasoconstrictor (epinephrine 1:200,000)

6 cartridges provides 408 mg articaine HCl (4%) and 0.051 mg vasoconstrictor (epinephrine 1:200,000)

7 cartridges provides 476 mg articaine HCl (4%) and 0.060 mg vasoconstrictor (epinephrine 1:200,000)

8 cartridges provides 544 mg articaine HCl (4%) and 0.068 mg vasoconstrictor (epinephrine 1:200,000)

Dosing: ElderlyAdminister smallest dose to produce desired result.

Geriatric patients (dosages in a clinical trial):

65-75 years

Simple procedures: 0.43-4.76 mg/kg (0.9-11.9 mL) was administered safely to 35 patients.

Complex procedures: 1.05-4.27 mg/kg (1.3-6.8 mL) was administered safely to 19 patients.

≥75 years:

Simple procedures: 0.78-4.76 mg/kg (1.3-11.9 mL) was administered safely to 7 patients.

Complex procedures: 1.12-2.17 mg/kg (1.3-5.1 mL) was administered safely to 4 patients.

Note: Approximately 6% of the patients 65-75 years of age (none of the patients ≥75 years of age) required additional injections for complete anesthesia, compared to 11% of the patients 17-65 years of age who required additional injections.

Dosing: Pediatric**Note:** Give smallest dose that will produce desired result

Children <4 years: Safety and efficacy have not been established

Children 4-16 years (dosages in a clinical trial of 61 patients):

Simple procedures: 0.76-5.65 mg/kg (0.9-5.1 mL) was administered safely to 51 patients

Complex procedures: 0.37-7.48 mg/kg (0.7-3.9 mL) was administered safely to 10 patients

Note: Approximately 13% of the pediatric patients required additional injections for complete anesthesia

Maximum recommended dosages: Children (use in pediatric patients <4 years is not recommended): Not to exceed 7 mg/kg (0.175 mL/kg) **or** 3.2 mg/lb (0.0795 mL/lb) of body weight

ContraindicationsHypersensitivity to local anesthetics of the amide type or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Cardiovascular effects: Systemic absorption of local anesthetics may produce cardiovascular effects. Changes in cardiac conduction, excitability, refractoriness, contractility, and peripheral vascular resistance are minimal at blood concentrations produced by therapeutic doses. However, toxic blood concentrations depress cardiac conduction and excitability, which may lead to AV block, ventricular arrhythmias, and cardiac arrest (sometimes resulting in death). In addition, myocardial contractility is depressed and peripheral vasodilation occurs, leading to decreased cardiac output and arterial blood pressure. Careful and constant monitoring of cardiovascular and respiratory (adequacy of ventilation) vital signs should be done following each local anesthetic injection.

- CNS toxicity: Careful and constant monitoring of the patient's state of consciousness should be done following each local anesthetic injection; at such times, restlessness, anxiety, tinnitus, dizziness, blurred vision, tremors, depression, or drowsiness may be early warning signs of CNS toxicity. Treatment is primarily symptomatic and supportive.

- Methemoglobinemia: Has been reported with articaine; may be treated with methylene blue, 1-2 mg/kg I.V. infused over several minutes.

- Respiratory arrest: Local anesthetics have been associated with rare occurrences of sudden respiratory arrest.

- Seizures: Convulsions due to systemic toxicity leading to cardiac arrest have also been reported, presumably following unintentional intravascular injection.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with impaired cardiovascular function, since they may be less able to compensate for function changes associated with prolonged AV conduction produced by these drugs. Use with caution in patients with heart block.

- Hepatic impairment: Use with caution in patients with severe hepatic disease; *in vitro* studies show that ~5% to 10% of articaine is metabolized by the human liver microsomal P450 isoenzyme system; however, no studies have been performed in patient with liver dysfunction.

- Vascular disease: Local anesthetic solutions containing a vasoconstrictor should be used cautiously. Patients with peripheral vascular disease or hypertensive vascular disease may exhibit exaggerated vasoconstrictor response, possibly resulting in ischemic injury or necrosis.

Concurrent drug therapy issues:

- Epinephrine: Contains epinephrine, which can cause local tissue necrosis or systemic toxicity, usual precautions for epinephrine administration should be observed. Administration of articaine HCl with epinephrine results in a three- to fivefold increase in plasma epinephrine concentrations compared to baseline; however, in healthy adults, it does not appear to be associated with marked increases in blood pressure or heart rate, except in the case of accidental intravascular injection.

- General anesthetics: Use with caution in patients during or following the administration of a potent general anesthetic agent, since cardiac arrhythmias may occur under these conditions.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <4 years of age.

Dosage form specific issues:

- Sodium metabisulfite: Products may contain sodium metabisulfite, which may cause allergic-type reactions (including anaphylactic symptoms, and life-threatening or less severe asthmatic episodes) in certain susceptible patients. The overall prevalence of the sulfite sensitivity in the general population is unknown, and is seen more frequently in asthmatic than in nonasthmatic persons.

Other warnings/precautions:

- Administration: Intravascular injections should be avoided; aspiration should be performed prior to administration; the needle must be repositioned until no return of blood can be elicited by aspiration; however, absence of blood in the syringe does not guarantee that intravascular injection has been avoided.

- Appropriate dosing: To avoid serious adverse effects and high plasma levels, the lowest dosage resulting in effective anesthesia should be administered. Repeated doses may cause significant increases in blood levels with each repeated dose due to the possibility of accumulation of the drug or its metabolites. Tolerance to elevated blood levels varies with patient status. Reduced dosages, commensurate with age and physical condition, should be given to debilitated patients, elderly patients, acutely-ill patients, and pediatric patients.

- Dental blocks: Small doses of local anesthetics injected into dental blocks may produce adverse reactions similar to systemic toxicity seen in unintentional intravascular injections at larger doses. Confusion, convulsions, respiratory depression and/or respiratory arrest, and cardiovascular stimulation or depression have been reported. These reactions may be due to intra-arterial injection of the local anesthetic with retrograde flow to the cerebral circulation. Patients receiving such blocks should be observed constantly with resuscitative equipment and personnel trained in treatment of adverse reactions immediately available. Dosage recommendations should not be exceeded.

- Trained personnel: Dental practitioners and/or clinicians using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known whether articaine is excreted in human milk.

Adverse ReactionsAdverse reactions to Septocaine™ are characteristic of those associated with other amide-type local anesthetics; adverse reactions to this group of drugs may also result from excessive plasma levels which may be due to overdosage, unintentional intravascular injection, or slow metabolic degradation.

≥1% (in controlled trial of 882 patients):

Central nervous system: Headache (4%), paresthesia (1%)

Gastrointestinal: Gingivitis (1%)

Miscellaneous: Pain (body as a whole 13%), facial edema (1%)

<1% (adverse and intercurrent events recorded in 1 or more patients in controlled trials, occurring at an overall rate of <1%, and considered clinically significant): Abdominal pain, accidental injury, arthralgia, asthenia, back pain, constipation, diarrhea, dizziness, dry mouth, dysmenorrhea, dyspepsia, ear pain, ecchymosis, edema, facial paralysis, glossitis, gum hemorrhage, hemorrhage, hyperesthesia, lymphadenopathy, malaise, methemoglobinemia, migraine, mouth ulceration, myalgia, nausea, neck pain, nervousness, neuropathy, osteomyelitis, pharyngitis, pruritus, rhinitis, salivation increased, skin disorder, somnolence, stomatitis, syncope, tachycardia, taste perversion, thirst, tongue edema, tooth disorder, vomiting

Additional adverse reactions reported with articaine and epinephrine: Arrhythmia, myocardial depression, asthma, convulsions, allergic reactions, injection site reactions, tissue necrosis

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. *Risk D: Consider therapy modification*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

COMT Inhibitors: May decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

Inhalational Anesthetics: May enhance the arrhythmogenic effect of EPINEPHrine. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). *Risk D: Consider therapy modification*

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, solution:

Astracaine® with epinephrine 1:200,000 [CAN]: Articaine 4% and epinephrine 1:200,000 (1.8 mL) [not available in the U.S.]

Astracaine® Forte with epinephrine forte 1:100,000 [CAN]: Articaine 4% and epinephrine 1:100,000 (1.8 mL) [not available in the U.S.]

Septanest® N [CAN]: Articaine 4% and epinephrine 1:200,000 (1.7 mL) [not available in the U.S.]

Septanest® SP [CAN]: Articaine 4% and epinephrine 1:100,000 (1.7 mL) [not available in the U.S.]

Septocaine® with epinephrine 1:100,000: Articaine hydrochloride 4% and epinephrine bitartrate 1:100,000 (1.7 mL) [contains sodium metabisulfite]

Septocaine® with epinephrine 1:200,000: Articaine hydrochloride 4% and epinephrine bitartrate 1:200,000 (1.7 mL) [contains sodium metabisulfite]

Ultracaine DS® [CAN]: Articaine hydrochloride 4% and epinephrine 1:200,000 (1.7 mL) [contains sodium metabisulfite; not available in the U.S.]

Ultracaine DS Forte® [CAN]: Articaine hydrochloride 4% and epinephrine 1:100,000 (1.7 mL) [contains sodium metabisulfite; not available in the U.S.]

Zorcaine™: Articaine hydrochloride 4% and epinephrine bitartrate 1:100,000 (1.7 mL) [contains sodium metabisulfite]

Generic Available

No

Mechanism of Action

Local anesthetics block the generation and conduction of nerve impulses, presumably by increasing the threshold for electrical excitation in the nerve, by slowing the propagation of the nerve impulse, and by reducing the rate of rise of the action potential. In general, the progression of anesthesia is related to the diameter, myelination, and conduction velocity of the affected nerve fibers. Clinically, the order of loss of nerve function is as follows: 1) pain, 2) temperature, 3) touch, 4) proprioception, and 5) skeletal muscle tone.

Pharmacodynamics/Kinetics

Onset of action: 1-6 minutes

Duration: Complete anesthesia: ~1 hour

Metabolism: Hepatic via plasma carboxyesterase to articainic acid (inactive)

Half-life elimination: Articaine: 1.8 hours; Articainic acid: 1.5 hours

Excretion: Urine (primarily as metabolites)

Pharmacotherapy Pearls

Septocaine™ (articaine hydrochloride 4% and epinephrine 1:100,000) is the first FDA approval in 30 years of a new local dental anesthetic providing complete pulpal anesthesia for approximately 1 hour. Chemically, articaine contains both an amide linkage and an ester linkage, making it chemically unique in the class of local anesthetics.

Dental Health Professional Considerations

Septocaine™ (articaine hydrochloride 4% and epinephrine 1:100,000) is the first FDA approval in 30 years of a new local dental anesthetic providing complete pulpal anesthesia for approximately 1 hour. Chemically, articaine contains both an amide linkage and an ester linkage, making it chemically unique in the class of local anesthetics. Since it contains the ester linkage, articaine HCl is rapidly metabolized by plasma carboxyesterase to its primary metabolite, articainic acid, which is an inactive product of this metabolism. According to the manufacturer, *in vitro* studies show that the human liver microsomal P450 isoenzyme system metabolizes approximately 5% to 10% of available articaine with nearly quantitative conversion to articainic acid. The elimination half-life of articaine is about 1.8 hours, and that of articainic acid is about 1.5 hours. Articaine is excreted primarily through urine with 53% to 57% of the administered dose eliminated in the first 24 hours following submucosal administration. Articainic acid is the primary metabolite in urine. A minor metabolite, articainic acid glucuronide, is also excreted in the urine. Articaine constitutes only 2% of the total dose excreted in urine.

The anesthetic efficacy of the articaine 4% with 1:200,000 epinephrine (A/200) was compared to that of articaine 4% with 1:100,000 (A/100) using electric pulp tester to assess anesthesia using 63 subjects after either maxillary infiltration (Moore, 2006) or inferior alveolar block (Hersh, 2006).

After maxillary infiltration of 1 mL of each formula, the onset times to anesthesia were 3.1 ± 2.3 minutes for articaine 4% and 1:200,000 epinephrine (A/200), 3 ± 2.1 minutes for articaine 4% and 1:100,000 epinephrine (A/100), 3 ± 2 minutes for articaine 4% with no epinephrine (A/no). These three mean times of onset were not statistically different. Durations of anesthesia were 41.6 ± 21.1 minutes A/200, 45 ± 23.6 minutes A/100, 13.3 ± 6.8 minutes for A/no. There was no statistically significant difference between the durations elicited by the A/200 and A/100 formulations (Moore, 2006). In the second trial of the study, also using 63 subjects, the investigators administered an inferior alveolar nerve block injection of one cartridge (1.7 mL) using a standard intra-oral injection technique for inferior alveolar block anesthesia. Pulpal anesthesia was measured again using the pulp tester.

The onset times to anesthesia were 4.7 ± 2.6 minutes A/200, 4.2 ± 2.8 minutes A/100, and 4.3 ± 2.5 minutes for A/no. There were no statistically significant differences in these times to onset. Durations of anesthesia were 51.2 ± 55.9 minutes A/200, 61.8 ± 59 minutes A/100, and 49.7 ± 44.6 minutes for A/no. There were no statistically significant differences in the duration between A/200, A/100, and A/no formulations (Hersh, 2006).

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions (see Dental Comment)

Mental Health: Effects on Mental StatusMay cause depression, nervousness, sedation, or dizziness

Mental Health: Effects on Psychiatric TreatmentLocal anesthetics pose several drug-drug interactions with psychotropic agents (refer to Drug Interactions). Best to avoid use with ziprasidone since local anesthetics have the potential to produce adverse cardiovascular effects.

Index TermsEpinephrine and Articaine Hydrochloride

Pharmacologic CategoryVitamin, Water Soluble

Use: Labeled IndicationsPrevention and treatment of scurvy; acidify the urine

Use: Unlabeled/InvestigationalInvestigational: In large doses, to decrease the severity of “colds”; dietary supplementation; a 20-year study was recently completed involving 730 individuals which indicates a possible decreased risk of death by stroke when ascorbic acid at doses ≥45 mg/day was administered

Dosing: Adults

Recommended daily allowance (RDA): Upper limit of intake should not exceed 2000 mg/day

- Male: 90 mg
- Female: 75 mg
  - Pregnant female:
    - ≤18 years: 80 mg; upper limit of intake should not exceed 1800 mg/day
    - 19-50 years: 85 mg; upper limit of intake should not exceed 2000 mg/day
  - Lactating female:
    - ≤18 years: 15 mg; upper limit of intake should not exceed 1800 mg/day
    - 19-50 years: 20 mg; upper limit of intake should not exceed 2000 mg/day
- Adult smoker: Add an additional 35 mg/day

Scurvy: Oral, I.M., I.V., SubQ: 100-250 mg 1-2 times/day for at least 2 weeks

Urinary acidification: Oral, I.V.: 4-12 g/day in 3-4 divided doses

Prevention and treatment of colds: Oral: 1-3 g/day

Dietary supplement: Oral: 50-200 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Recommended daily allowance (RDA):

- <6 months: 30 mg
- 6 months to 1 year: 35 mg
- 1-3 years: 40 mg
- 4-10 years: 45 mg
- 11-14 years: 50 mg
- >14 years: 60 mg

Scurvy: Oral, I.M., I.V., SubQ: Children: 100-300 mg/day in divided doses for at least 2 weeks

Urinary acidification: Oral, I.V.: Children: 500 mg every 6-8 hours

Dietary supplement: Oral: Children: 35-100 mg/day

Administration: I.V.Avoid rapid I.V. injection.
Administration: I.V. DetailpH: 5.5-7
Dietary ConsiderationsMild-C®: 3600 mg/teaspoonful contains calcium 400 mg/teaspoonful. Vicks® Vitamin C: 25 mg contains sodium 5 mg
StorageInjectable form should be stored under refrigeration (2°C to 8°C). Protect oral dosage forms from light. Rapidly oxidized when in solution in air and alkaline media.
CompatibilityStable in dextran 6% in D_5W, dextran 6% in NS, D_5LR, D_5NS, $D_5{}^1/_2NS$, $D_5{}^1/_4NS$, D_5W, $D_{10}W$, LR, $^1/_2NS$, NS; **variable stability (consult detailed reference)** in fat emulsion 10%

Y-site administration: Compatible: Warfarin. **Incompatible:** Etomidate, thiopental. **Variable (consult detailed reference):** Propofol, TPN.

Compatibility in syringe: Compatible: Metoclopramide. **Incompatible:** Cefazolin, doxapram.

Compatibility when admixed: Compatible: Amikacin, calcium chloride, calcium gluconate, chloramphenicol, chlorpromazine, colistimethate, cyanocobalamin, diphenhydramine, heparin, hydrocortisone sodium succinate, kanamycin, methyldopate, penicillin G potassium, polymyxin B sulfate, procaine, prochlorperazine, promethazine, verapamil. **Incompatible:** Bleomycin, chlorothiazide, nafcillin, sodium bicarbonate, theophylline. **Variable (consult detailed reference):** Aminophylline, erythromycin lactobionate.

Warnings/Precautions

Disease-related concerns:

- Diabetes: Patients with diabetes mellitus should not take excessive doses for extended periods of time.

- Renal calculi: Patients prone to recurrent renal calculi (eg, dialysis patients) should not take excessive doses for extended periods of time.

Dosage form specific issues:

- Aluminum: Some parenteral products contain aluminum; use caution in patients with impaired renal function and neonates.

Geriatric ConsiderationsMinimum RDA for elderly is not established. Vitamin C is provided mainly in citrus fruits and tomatoes. The elderly, however, avoid citrus fruits due to cost and difficulty preparing (peeling). Daily replacement through a single multiple vitamin is recommended. Use of natural vitamin C or rose hips offers no advantages. Acidity may produce GI complaints.
Pregnancy Risk FactorA/C (dose exceeding RDA recommendation)
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted.
LactationEnters breast milk/compatible
Adverse Reactions

1% to 10%: Renal: Hyperoxaluria with large doses

<1%: Flushing, faintness, dizziness, headache, fatigue, nausea, vomiting, heartburn, diarrhea, flank pain

Drug Interactions

Aluminum Hydroxide: Ascorbic Acid may increase the absorption of Aluminum Hydroxide. *Risk D: Consider therapy modification*

Amphetamines: Gastrointestinal Acidifying Agents may decrease the serum concentration of Amphetamines. *Risk C: Monitor therapy*

Deferoxamine: Ascorbic Acid may enhance the adverse/toxic effect of Deferoxamine. Left ventricular dysfunction is of particular concern. *Risk D: Consider therapy modification*

Test InteractionsFalse-positive urinary glucose with cupric sulfate reagent, false-negative urinary glucose with glucose oxidase method; false-negative stool occult blood 48-72 hours after ascorbic acid ingestion
Monitoring ParametersMonitor pH of urine when using as an acidifying agent
Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Instruct patients with diabetes accordingly. Assess knowledge/teach patient appropriate administration according to formulation of drug and purpose for ascorbic acid therapy and adverse symptoms to report.
Monitoring: Lab TestspH of urine when used as an acidifying agent
Patient EducationTake exactly as directed; do not take more than the recommended dose. Do not chew or crush extended release tablets. Take oral doses with 8 oz of water. If you have diabetes, use serum glucose monitoring method. Report pain on urination, faintness, or flank pain. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet: 1000 mg

Caplet, timed release: 500 mg, 1000 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Vitamin C)

500 mg (100): $12.99

Mechanism of ActionNot fully understood; necessary for collagen formation and tissue repair; involved in some oxidation-reduction reactions as well as other metabolic pathways, such as synthesis of carnitine, steroids, and catecholamines and conversion of folic acid to folinic acid

Pharmacodynamics/Kinetics

Absorption: Oral: Readily absorbed; an active process thought to be dose dependent

Distribution: Large

Metabolism: Hepatic via oxidation and sulfation

Excretion: Urine (with high blood levels)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental Status Rare reports of drowsiness; usually well tolerated

Mental Health: Effects on Psychiatric Treatment May decrease fluphenazine levels; clinical significance unknown but likely not problematic

Cardiovascular Considerations The majority of studies show that supplemental vitamin C (ascorbic acid) has no beneficial effect on reducing cardiovascular risk; routine use in this setting is not recommended. The 2004 ACC/AHA STEMI guidelines do not recommend it.

Index Terms Vitamin C

Asparaginase

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Asparaginase may be confused with pegaspargase

Elspar® may be confused with Elaprase™

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of classes of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(a SPEAR a ji nase)
U.S. Brand NamesElspar®
Canadian Brand NamesElspar®; Kidrolase®
Pharmacologic Category[Antineoplastic Agent, Miscellaneous]
Use: Labeled IndicationsTreatment of acute lymphocytic leukemia (ALL)
Use: Unlabeled/InvestigationalTreatment of lymphoma
Dosing: AdultsRefer to individual protocols. **Note:** Dose, frequency, number of doses, and start date may vary by protocol and treatment phase.

ALL:

I.V.:

6000 units/m^2/dose 3 times/week for ~6-9 doses **or**

1000 units/kg/day for 10 days **or**

High-dose therapy (unlabeled dose): 10,000 units/m^2/day for ~3-12 doses

Single-agent therapy (rare): 200 units/kg/day for 28 days

I.M.:

6000 units/m^2/dose 3 times/week for ~6-9 doses **or** 6000 units/m^2/dose every ~3 days for ~6-9 doses

High-dose therapy (unlabeled dose): 10,000 units/m^2/day for ~3-12 doses

Test dose: A test dose is often recommended prior to the first dose of asparaginase, or prior to restarting therapy after a hiatus of several days. Most commonly, 0.1 mL of a 20 units/mL (2 units) asparaginase dilution is injected intradermally, and the patient observed for at least 1 hour. False-negative rates of up to 80% to test doses of 2-50 units are reported.

Some practitioners recommend an asparaginase desensitization regimen for patients who react to a test dose, or are being retreated following a break in therapy. Doses are doubled and given every 10 minutes until the total daily dose for that day has been administered. One schedule begins with a total of 1 unit given I.V. and doubles the dose every 10 minutes until the total amount given is the planned dose for that day. For example, if a patient was to receive a total dose of 4000 units, he/she would receive injections 1 through 12 during the desensitization. See table.

Asparaginase Desensitization

Injection No.	Elspar Dose (int. units)	Accumulated Total Dose
1	1	1
2	2	3
3	4	7
4	8	15

5	16	31
6	32	63
7	64	127
8	128	255
9	256	511
10	512	1023
11	1024	2047
12	2048	4095
13	4096	8191
14	8192	16,383
15	16,384	32,767
16	32,768	65,535
17	65,536	131,071
18	131,072	262,143

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols. **Note:** Dose, frequency, number of doses, and start date may vary by protocol and treatment phase.

ALL:

I.V.:

6000 units/m^2/dose 3 times/week for ~6-9 doses **or**

1000 units/kg/day for 10 days **or**

High-dose therapy (unlabeled dose): 10,000 units/m^2/dose every ~3 days for ~4-8 doses

I.M.:

6000 units/m^2/dose 3 times/week **or** 6000 units/m^2/dose every ~3 days for ~6-9 doses

High-dose therapy (unlabeled dose): 10,000 units/m^2/dose every ~3 days for ~4-8 doses **or** 25,000 units/m^2/dose weekly for ~9 doses (generally used in high-risk continuation therapy)

Test dose: Refer to adult dosing.

Dosing: Combination Regimens

Leukemia, acute lymphocytic:

Hyper-CVAD (Leukemia, Acute Lymphocytic)

Larson Regimen

Linker Protocol

PVA (POG 8602)

PVDA

Leukemia, acute myeloid: CA

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.M.Doses should be given as a deep intramuscular injection into a large muscle; volumes >2 mL should be divided and administered in 2 separate sites

Administration: I.V.

Note: I.V. administration greatly increases the risk of allergic reactions and should be avoided if possible.

The following precautions should be taken when administering. Administer in 50-250 mL of D_5W over at least 30-60 minutes. The manufacturer recommends a test dose (0.1 mL of a dilute 20 unit/mL solution) prior to initial administration and when given after an interval of 7 days or more. Institutional policies vary. The skin test site should be observed for at least 1 hour for a wheal or erythema. Note that a negative skin test does not preclude the possibility of an allergic reaction. Desensitization may be performed in patients who have been found to be hypersensitive by the intradermal skin test or who have received previous courses of therapy with the drug. Have epinephrine, diphenhydramine, and hydrocortisone at the bedside. Have a running I.V. in place. A physician should be readily accessible.

Administration: I.V. DetailThe intradermal skin test is commonly given prior to the initial injection, using a dose of 0.1 mL of 20 units/mL solution (~2 units). The skin test site should be observed for at least 1 hour for a wheal or erythema. Do not infuse through filter.

Gelatinous fiber-like particles may develop on standing. Filtration through a 5-micron filter during administration will remove the particles with no loss of potency.

pH: 7.4; 6.5-8 (active enzyme)

Administration: OtherHas been administered SubQ in specific protocols

StorageIntact vials of powder should be refrigerated at 2°C to 8°C (36°F to 48°F). Reconstituted solutions are stable 1 week refrigerated at 8°C (Stecher, 1999), although the manufacturer recommends use within 8 hours. Solutions for I.V. infusion are stable for 8 hours at room temperature or under refrigeration.

ReconstitutionLyophilized powder should be reconstituted with 1-5 mL sterile water for injection or NS for I.V. administration; NS for I.M. use. Shake well, but not too vigorously. A 5 micron filter may be used to remove fiber-like particles in the solution (do not use a 0.2 micron filter; has been associated with loss of potency).

Standard I.M. dilution: 2000, 5000, or 10,000 int. units/mL

Standard I.V. dilution: Dilute in 50-250 mL NS or D_5W

Test dose preparation: Reconstitute a 10,000 unit vial with 5 mL NS or SWFI (concentration = 2000 units/mL); withdraw 0.1 mL and add to 9.9 mL NS (concentration = 20 units/mL); test dose is 0.1 mL (2 units)

CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Methotrexate, sodium bicarbonate

ContraindicationsHistory of serious allergic reaction to asparaginase or any *E. coli*-derived asparaginase; history of serious thrombosis with prior asparaginase treatment; history of pancreatitis with prior asparaginase treatment; serious hemorrhagic events with prior asparaginase treatment

Allergy Considerations

- Asparaginase Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Allergic reactions: Severe allergic reactions may occur; monitor; immediate treatment for hypersensitivity reactions should be available during administration. Risk factors for allergic reactions include: I.V. administration, doses >6000-12,000 units/m^2, patients who have received previous cycles of asparaginase, and intervals of even a few days between doses. Up to 33% of patients who have an allergic reaction to *E. coli* asparaginase will also react to the *Erwinia* form or pegaspargase. A test dose may be administered prior to the first dose of asparaginase, or prior to restarting therapy after a hiatus of several days. **False-negative rates of up to 80% to test doses of 2-50 units are reported.** Desensitization may be performed in patients found to be hypersensitive by the intradermal test dose or who have received previous courses of therapy with the drug.

- Coagulopathy: Increased prothrombin time, partial thromboplastin time, and hypofibrinogenemia may occur; cerebrovascular hemorrhage has been reported; monitor coagulation parameters. Use with caution in patients with an underlying coagulopathy.

- Hyperglycemia: May cause hyperglycemia/glucose intolerance (may be irreversible); monitor blood glucose.

- Pancreatitis: May cause serious and possibly fatal pancreatitis; promptly evaluate patients with abdominal pain; discontinue permanently if pancreatitis develops.

- Thrombotic events: Serious thrombosis, including sagittal sinus thrombosis may occur; discontinue with serious thrombotic events.

- Tumor lysis syndrome: Appropriate measures must be taken to prevent tumor lysis syndrome and subsequent hyperuricemia and uric acid nephropathy; monitor, consider allopurinol, hydration and urinary alkalization.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with pre-existing hepatic impairment; may alter function.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDecreased weight gain, resorptions, gross abnormalities, and skeletal abnormalities were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions**Note:** Immediate effects: Fever, chills, nausea, and vomiting occur in 50% to 60% of patients.

>10%:

Central nervous system: Fatigue, fever, chills, depression, agitation, seizure (10% to 60%), somnolence, stupor, confusion, coma (25%)

Endocrine & metabolic: Hyperglycemia/glucose intolerance (10%)

Gastrointestinal: Nausea, vomiting (50% to 60%), anorexia, abdominal cramps (70%), acute pancreatitis (15%, may be severe in some patients)

Hematologic: Hypofibrinogenemia and depression of clotting factors V and VIII, variable decrease in factors VII and IX, severe protein C deficiency and decrease in antithrombin III (may be dose limiting or fatal)

Hepatic: Transaminases, bilirubin, and alkaline phosphatase increased (transient)

Hypersensitivity: Acute allergic reactions (fever, rash, urticaria, arthralgia, hypotension, angioedema, bronchospasm, respiratory distress, anaphylaxis (15% to 35%); may be dose limiting in some patients, may be fatal)

Renal: Azotemia (66%)

1% to 10%:

Endocrine & metabolic: Hyperuricemia

Gastrointestinal: Stomatitis

Miscellaneous: Allergic reaction (including anaphylaxis), antibody formation/immunogenicity (~25%)

<1%, postmarketing case reports, and/or frequency not defined: Acute renal failure, albumin decreased, cerebrovascular hemorrhage, cerebrovascular thrombosis, cough, disorientation, drowsiness, fatty liver, fibrinogen decreased, glucosuria, hallucinations, headache, hemorrhagic pancreatitis, hyper-/hypolipidemia, hyperthermia, hypocholesterolemia, hypotension, insulin-dependent diabetes, intracranial hemorrhage, irritability, ketoacidosis, laryngospasm, malabsorption syndrome, pancreatic pseudocyst, Parkinsonian symptoms (including tremor and increased muscle tone), partial thromboplastin time increased, peripheral edema, polyuria, proteinuria, prothrombin time increased, pruritus, rash, renal insufficiency, serum ammonia increased, serum cholesterol decreased, sagittal sinus thrombosis, thrombosis, urticaria, venous thrombosis, weight loss; mild-to-moderate myelosuppression, leukopenia, anemia, thrombocytopenia (onset: 7 days, nadir: 14 days, recovery: 21 days)

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Test InteractionsDecreased thyroxine and thyroxine-binding globulin

Monitoring ParametersVital signs during administration; CBC with differential, urinalysis, amylase, liver enzymes, coagulation parameters (baseline and periodic), renal function tests, urine dipstick for glucose, blood glucose, uric acid. Monitor for allergic reaction, be prepared to treat anaphylaxis at each administration; monitor for onset of abdominal pain and mental status changes.

Nursing: Physical Assessment/MonitoringSee information related to skin tests and desensitization. Assess potential for interactions with other pharmacological agents patient may be taking. Assess results of skin tests and regular laboratory tests prior to and frequently during therapy. With each dose, patient should be monitored closely for adverse reactions; acute hypersensitivity reactions (may occur in 10% to 40% of patients and can be fatal), hyperglycemia, CNS changes, or nausea or vomiting. In event of hypersensitivity or hyperglycemia, infusion should be stopped and prescriber notified immediately. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, serum amylase, blood glucose, uric acid, liver function prior to and frequently during therapy

Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. This medication can only be given I.M. or I.V. Report immediately any pain or burning at infusion/injection site, rash, chest pain, respiratory difficulty or chest tightness, difficulty swallowing, or sharp back pain. It is vital to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and good nutritional status (small, frequent meals may help). May cause acute nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help - or consult prescriber for approved antiemetic). Report unusual fever or chills; changes in mentation (confusion, agitation, depression, stupor, seizures); yellowing of skin or eyes; unusual bleeding or bruising; unhealed sores; or vaginal discharge. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Elspar®: 10,000 units

Generic AvailableNo

ManufacturerOvation Pharmaceuticals, Inc

Mechanism of ActionAsparaginase inhibits protein synthesis by hydrolyzing asparagine to aspartic acid and ammonia. Leukemia cells, especially lymphoblasts, require exogenous asparagine; normal cells can synthesize asparagine. Asparaginase is cycle-specific for the G_1 phase.

Pharmacodynamics/Kinetics

Absorption: I.M.: Produces peak blood levels 50% lower than those from I.V. administration

Distribution: V_d: 4-5 L/kg; 70% to 80% of plasma volume; <1% CSF penetration

Metabolism: Systemically degraded

Half-life elimination: I.M.: 39-49 hours; I.V.: 8-30 hours

Time to peak, plasma: I.M.: 14-24 hours

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsSome institutions recommended the following precautions for asparaginase administration: Parenteral epinephrine, diphenhydramine, and hydrocortisone available at bedside; freely running I.V. in place; physician readily accessible; monitor the patient closely for 30-60 minutes; avoid administering at night.

The *E. coli* and the *Erwinia* strains of asparaginase differ slightly in their gene sequencing, and have slight differences in their enzyme characteristics. Both are highly specific for asparagine and have <10% activity for the D-isomer. The *E. coli* form is more commonly used. The *Erwinia* variety is no longer commercially available in the U.S., although may be obtained through clinical trials or on a compassionate use basis.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusRare reports of depression, disorientation, and hallucinations

Mental Health: Effects on Psychiatric TreatmentMay cause myelosuppression; use caution with clozapine and carbamazepine

Index Terms*E. coli* Asparaginase; *Erwinia* Asparaginase; L-asparaginase; NSC-106977 (*Erwinia*); NSC-109229 (*E. coli*)

Aspirin and Diphenhydramine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation

(AS pir in & dye fen HYE dra meen)

U.S. Brand NamesAlka-Seltzer® P.M. [OTC]; Bayer® PM [OTC]
Pharmacologic CategoryAnalgesic, Miscellaneous
Use: Labeled IndicationsAid in the relief of insomnia accompanied by minor pain or headache
Dosing: Adults

Pain-associated insomnia: Oral: Two tablets (650 mg aspirin/76 mg diphenhydramine citrate) **or** 2 caplets (1000 mg aspirin/76 mg diphenhydramine citrate) at bedtime or as directed by physician; do not exceed recommended dosage

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Children ≥12 years: Refer to adult dosing.

Administration: Oral

Alka-Seltzer® PM: Dissolve tablets in 4 ounces of water before taking.

Bayer® PM: Administer each dose with a full glass of water.

Dietary ConsiderationsAlka-Seltzer® PM contains phenylalanine 4 mg per tablet and sodium 504 mg per tablet.
Contraindications

Hypersensitivity to aspirin, other pain relievers or fever reducers; other products containing diphenhydramine (including topical); use in children <12 years of age; pregnancy (third trimester)

Warnings/Precautions

Concerns related to adverse effects:

- Salicylate sensitivity: Patients with nasal polyps, asthma, and sensitivity to tartrazine dyes may have an increased risk of salicylate sensitivity.

Special populations:

- Pediatrics: When used for self-medication (OTC labeling): Children and teenagers who have or are recovering from chickenpox or flu-like symptoms should not use this product. Changes in behavior (along with nausea and vomiting) may be an early sign of Reye's syndrome; patients should be instructed to contact their healthcare provider if these occur.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Other warnings/precautions:

- Self-medication (OTC use): Prior to self-medication, patients should contact healthcare provider if they have had recurring stomach pain or upset, ulcers, bleeding problems, asthma, emphysema, chronic bronchitis, glaucoma, enlarged prostate, other serious medical problems, on a sodium-restricted diet, are currently taking an anticoagulant or sedative, or medicine for arthritis, diabetes, or gout. Recommended dosages should not be exceeded, due to an increased risk of GI bleeding. Stop use and consult a healthcare provider if symptoms get worse; if an allergic reaction occurs; if ringing in the ears or hearing loss occurs; if sleeplessness lasts for >2 weeks or if pain lasts >10 days. Consuming ≥3 alcoholic beverages/day or taking longer than recommended may increase the risk of GI bleeding.

Pregnancy ConsiderationsSee individual agents.
LactationSee individual agents.
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsSee individual agents.
Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central).

Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol Avoid ethanol (may enhance gastric mucosal damage).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet:

Bayer® PM: Aspirin 500 mg and diphenhydramine citrate 38.3 mg

Tablet, effervescent:

Alka-Seltzer® PM: Aspirin 325 mg and diphenhydramine citrate 38 mg [contains phenylalanine 4 mg/tablet and sodium 504 mg/tablet]

Generic AvailableNo

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Aspirin
- DiphenhydrAMINE

Pharmacotherapy PearlsDiphenhydramine hydrochloride 50 mg = Diphenhydramine citrate 76 mg

Mental Health: Effects on Mental StatusMay cause confusion, dizziness, drowsiness, euphoria, excitation, fatigue, insomnia, irritability, nervousness, paradoxical excitement, and restlessness

Mental Health: Effects on Psychiatric TreatmentMay cause drowsiness and anticholinergic effects; concomitant use with psychotropic agents may produce additive effects. The anticholinergic effects of diphenhydramine may mitigate beneficial effects of acetylcholinesterase inhibitors. May cause leukopenia; use caution with clozapine and carbamazepine. Aspirin may displace valproic acid from binding sites resulting in an increase of unbound drug; monitor for toxicity. Diphenhydramine may diminish the therapeutic effect of tramadol via inhibition of CYP2D6 preventing the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects.

Index TermsASA and Diphenhydramine; Aspirin and Diphenhydramine Citrate; Diphenhydramine and ASA; Diphenhydramine and Aspirin; Diphenhydramine Citrate and Aspirin

Medication Safety Issues

Sound-alike/look-alike issues:

Aggrenox® may be confused with Aggrastat®

Pronunciation(AS pir in & dye peer ID a mole)

U.S. Brand NamesAggrenox®

Canadian Brand NamesAggrenox®

Pharmacologic CategoryAntiplatelet Agent

Use: Labeled IndicationsReduction in the risk of stroke in patients who have had transient ischemia of the brain or completed ischemic stroke due to thrombosis

Dosing: AdultsStroke prevention: Oral: 1 capsule (200 mg dipyridamole, 25 mg aspirin) twice daily

Alternative regimen for patients with intolerable headache: 1 capsule at bedtime and low-dose aspirin in the morning. Return to usual dose (1 capsule twice daily) as soon as tolerance to headache develops (usually within a week).

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentAvoid use in patients with severe renal dysfunction (Cl_{cr} <10 mL/minute).

Dosing: Hepatic ImpairmentAvoid use in patients with severe hepatic impairment.

Calculations

- Creatinine Clearance: Adults

Administration: OralCapsule should be swallowed whole; do not crush or chew. May be given with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from excessive moisture.

ContraindicationsHypersensitivity to dipyridamole, aspirin, or any component of the formulation; allergy to NSAIDs; patients with asthma, rhinitis, and nasal polyps; bleeding disorders (factor VII or IX deficiencies); children <16 years of age with viral infections; pregnancy (aspirin)

Allergy Considerations

- Salicylate Allergy/Sensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: Watch for signs and symptoms of GI ulcers and bleeding.
- Salicylate sensitivity: Patients with sensitivity to tartrazine dyes, nasal polyps, and asthma may have an increased risk of salicylate sensitivity.
- Tinnitus: Discontinue use if tinnitus or impaired hearing occurs.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with hypotension, unstable angina, and/or recent MI.
- Bleeding disorders: Use with caution in patients with platelet and bleeding disorders.
- Gastrointestinal disease: Use with caution in patients with erosive gastritis or peptic ulcer disease.
- Ethanol use: Heavy ethanol use (>3 drinks/day) can increase bleeding risks.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Myocardial prophylaxis use: Dose of aspirin in this combination is inadequate to prevent MI.
- Renal impairment: Use with caution in patients with renal impairment; avoid use in severe impairment.

Special populations:

- Elderly: Use with caution in the elderly who are at high risk for adverse events.
- Pediatrics: Safety and efficacy have not been established in children.
- Surgical patients: ASA should be avoided (if possible) in surgical patients for 1-2 weeks prior to surgery, to reduce the risk of excessive bleeding.

Geriatric ConsiderationsPlasma concentrations were 40% higher, but specific dosage adjustments have not been recommended. Some evidence suggests that the doses of dipyridamole commonly used are ineffective for prevention of platelet aggregation, however, the addition of aspirin will add substantial efficacy. The dose of aspirin is effective for platelet inhibition, but low enough to offer a low adverse drug reaction rate.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal reproduction studies have shown an increase in aspirin-related fetal toxicity with this combination. Use during pregnancy is not recommended; should not be used in the 3rd trimester of pregnancy. Maternal aspirin use during later pregnancy may result in low infant birth weight, stillbirth, neonatal death, and an increased incidence of intracranial hemorrhage in premature infants.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsBoth aspirin and dipyridamole are excreted in breast milk.

Adverse Reactions

>10%:

Central nervous system: Headache (38%; tolerance usually develops)

Gastrointestinal: Dyspepsia, abdominal pain (18%), nausea (16%), diarrhea (13%)

1% to 10%:

Cardiovascular: Cardiac failure (2%), syncope (1%)

Central nervous system: Fatigue (6%), pain (6%), amnesia (2%), malaise (2%), seizure (2%), confusion (1%), somnolence (1%)

Dermatologic: Purpura (1%)

Gastrointestinal: Vomiting (8%), bleeding (4%), rectal bleeding (2%), hemorrhoids (1%), hemorrhage (1%), anorexia (1%)

Hematologic: Anemia (2%)

Neuromuscular & skeletal: Arthralgia (6%), back pain (5%), weakness (2%), arthritis (2%), arthrosis (1%), myalgia (1%)

Respiratory: Cough (2%), epistaxis (2%) , upper respiratory tract infection (1%)

<1% (Limited to important or life-threatening): Agitation, allergic reaction, allergic vasculitis, alopecia, anaphylaxis, anemia (aplastic), angina pectoris, angioedema, antepartum and postpartum bleeding, arrhythmia, asthma, bronchospasm, bruising, cerebral edema, cerebral hemorrhage, chest pain, cholelithiasis, coagulopathy, coma, deafness, dehydration, disseminated intravascular coagulation (DIC), dizziness, dyspnea, ecchymosis, fever, flushing, gastritis, gingival bleeding, hearing impairment, hematemesis, hematoma, hematuria, hemoptysis, hepatic function abnormality, hepatic failure, hepatitis, hyper-/hypoglycemia, hyperpnea, hypotension, hypothermia, interstitial nephritis, intracranial hemorrhage (0.6%), jaundice, laryngeal edema, lower weight infants, palpitation, pancreatitis, pancytopenia, papillary necrosis, paresthesia, perforation, pregnancy and labor prolonged, PT time prolonged, proteinuria, pruritus, pulmonary edema, rash, renal insufficiency and failure, Reye's syndrome, rhabdomyolysis, Stevens-Johnson syndrome, stillbirths, subarachnoid hemorrhage, supraventricular tachycardia, tachycardia, tachypnea, taste loss, thirst, thrombocytopenia, thrombocytosis, tinnitus, ulceration, urticaria, uterine hemorrhage

Metabolism/Transport EffectsAspirin: **Substrate** of CYP2C9 (minor)

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Adenosine: Dipyridamole may enhance the therapeutic effect of Adenosine. Dose reduction of adenosine may be needed. *Risk D: Consider therapy modification*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Beta-Blockers: Dipyridamole may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Regadenoson: Dipyridamole may enhance the therapeutic effect of Regadenoson. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Topotecan: BCRP/ABCG2 Inhibitors may increase the serum concentration of Topotecan. *Risk D: Consider therapy modification*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy*

modification

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to GI irritation).
Monitoring ParametersHemoglobin, hematocrit, signs or symptoms of bleeding, signs or symptoms of stroke or transient ischemic attack
Nursing: Physical Assessment/MonitoringSee individual agents.
Monitoring: Lab TestsHemoglobin, hematocrit
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, variable release:

Aggrenox®: Aspirin 25 mg (immediate release) and dipyridamole 200 mg (extended release)

Generic AvailableNo
ManufacturerBoehringer Ingelheim, Corp
Pricing: U.S. (www.drugstore.com)

Capsule, 12-hour (Aggrenox)

25-200 mg (60): $161.99

Mechanism of ActionThe antithrombotic action results from additive antiplatelet effects. Dipyridamole inhibits the uptake of adenosine into platelets, endothelial cells, and erythrocytes. Aspirin inhibits platelet aggregation by irreversible inhibition of platelet cyclooxygenase and thus inhibits the generation of thromboxane A_2.
Pharmacodynamics/KineticsSee individual agents.
Related Information

- Aspirin
- Dipyridamole

Dental Health Professional ConsiderationsThere is no scientific evidence to warrant discontinuance of aspirin prior to dental surgery. Patients taking one aspirin tablet daily as an antithrombotic and who require dental surgery should be given special consideration in consultation with the physician before removal of the aspirin relative to prevention of postoperative bleeding.

The Food and Drug Administration (FDA), has issued a letter updating information and considerations regarding the use of ibuprofen (400 mg doses) in patients who are taking low dose aspirin (81 mg, immediate release; not enteric coated) for cardioprotection and stroke prevention. Ibuprofen, at these doses, may interfere with aspirin's antiplatelet effect depending upon when it is administered. Patients initiated on aspirin first (for ~1 week) then ibuprofen (400 mg 3 times/day for 10 days) seem to maintain aspirin's platelet effect (Cryer B, 2005). Ibuprofen has the greatest impact on aspirin if administered less than 8 hours before aspirin (Catella-Lawson F, 2001).

Patients may require counseling about the appropriate timing of ibuprofen dosing in relationship to aspirin therapy. With occasional use of ibuprofen, a clinically-significant interaction with aspirin in unlikely. To avoid interference during chronic dosing, a single dose of ibuprofen should be taken 30-120 minutes after aspirin ingestion or at least 8 hours should elapse after ibuprofen dosing before giving aspirin (FDA, 2006; Catella-Lawson F, 2001).

The clinical implications of the interaction are unclear. There have not been any clinical endpoint studies conducted at this time. Avoidance of this interaction is potentially important because aspirin's vascular protection could be decreased or negated.

Other nonselective NSAIDs may have potential for a similar interaction with aspirin. Such has been described with naproxen (Capone ML, 2005). Acetaminophen does not appear to interfere with the antiplatelet effect of aspirin. Other clinical scenarios (use of smaller ibuprofen doses, other aspirin products, other doses of aspirin) have not been evaluated.

Additional information is available at: http://www.fda.gov/cder/drug/infopage/aspirin/default.htm

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: As with all drugs which may affect hemostasis, bleeding is associated with aspirin. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables including dosage, concurrent use of multiple agents which alter hemostasis, and patient susceptibility. Many adverse effects of aspirin are dose related, and are rare at low dosages. Other serious reactions are idiosyncratic, related to allergy or individual sensitivity (see Dental Comment).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause amnesia, fatigue, and confusion
Mental Health: Effects on Psychiatric TreatmentEffect of antidepressants may be blunted due to sedation and fatigue; rare reports of pancytopenia; use caution with clozapine and carbamazepine
Index TermsAspirin and Extended-Release Dipyridamole; Dipyridamole and Aspirin

HMG-CoA Reductase Inhibitors: Evidence Does Not Suggest Increased Incidence of Amyotrophic Lateral Sclerosis (ALS) - Results of FDA Analysis - September 30, 2008

The U.S. Food and Drug Administration’s (FDA) review of 41 long-term controlled clinical trials of HMG-CoA reductase inhibitors finds no evidence of an increased incidence of ALS (also known as Lou Gehrig’s disease) related to these medications. This analysis occurred after the FDA had received notice of numerous adverse events of which 109 of these reports mentioned ALS, Lou Gehrig’s disease, or motor neurone disease. The clinical trials included in the analysis had a median duration of treatment of 3.3 years (range of duration: 6 months to 5 years) and involved 120,964 patients. The analysis identified a total of 19 cases of ALS – 9 cases per 64,602 patients (0.014%) with statin therapy and 10 cases per 56,362 patients (0.017%) with placebo. The incidence rates, based on approximately 400,000 person-years, were 4.2 per 100,000 person-years in the statin-treated group and 5 per 100,000 person-years in the placebo-treated group.

The FDA recommends that health care providers continue to prescribe, and patients continue to use these products as described within their labeling.

Pronunciation(AS pir in & PRA va stat in)

U.S. Brand NamesPravigard™ PAC [DSC]

Canadian Brand NamesPravASA

Pharmacologic CategoryAntilipemic Agent, HMG-CoA Reductase Inhibitor; Salicylate

Use: Labeled IndicationsCombination therapy in patients who need treatment with aspirin and pravastatin to reduce the incidence of cardiovascular events, including myocardial infarction, stroke, and death

Dosing: Adults

Reduction in cardiac events: Initial: Oral: Pravastatin 40 mg with aspirin (either 81 mg or 325 mg); both medications taken once daily. If pravastatin 40 mg does not achieve the desired cholesterol result, dosage may be increased to 80 mg once daily with aspirin (either 81 mg or 325 mg) once daily. Some patients may achieve/maintain goal cholesterol levels at a pravastatin dosage of 20 mg.

See Pravastatin for dosing in renal or hepatic impairment, as well as, dosing with concurrent cyclosporine therapy.

Dosing: ElderlyRefer to adult dosing.

Dietary ConsiderationsMay be taken with or without food. Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.

StorageStore at 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to pravastatin, aspirin, salicylates, or other NSAIDs, or any component of the formulation; syndrome of asthma, rhinitis, and nasal polyps; inherited or acquired bleeding disorders (including factor VII and factor IX deficiency); active liver disease; unexplained persistent elevations of serum transaminases; pregnancy; breast-feeding

Allergy Considerations

- HMG-CoA Reductase Inhibitor Allergy
- Salicylate Allergy/Sensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Myopathy/rhabdomyolysis: Patients receiving HMG-CoA reductase inhibitors have developed rhabdomyolysis with acute renal failure and/or myopathy; patients should be monitored closely. This risk is dose-related and is increased with concurrent use of other lipid lowering medications. Temporarily discontinue for elective major surgery, acute medical or surgical conditions, or in any patient experiencing an acute or serious condition predisposing to renal failure (eg, sepsis, hypotension, trauma, uncontrolled seizures). Based upon current evidence, HMG-CoA reductase inhibitor therapy should be continued in the perioperative period unless risk outweighs cardioprotective benefit. Use caution in patients with renal impairment, inadequately treated hypothyroidism, and those taking other drugs associated with myopathy (eg, colchicine); these patients are predisposed to myopathy. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine.

- Salicylate sensitivity: Patients with sensitivity to tartrazine dyes, nasal polyps, and asthma may have an increased risk of salicylate sensitivity.

- Tinnitus: Discontinue use if tinnitus or impaired hearing occurs.

Disease-related concerns:

- Bleeding disorders: Use aspirin with caution in patients with platelet and bleeding disorders.
- Dehydration: Use aspirin with caution in patients with dehydration.
- Gastrointestinal disease: Use aspirin with caution in patients with erosive gastritis or peptic ulcer disease.
- Hepatic impairment and/or ethanol use: Use with caution in patients who consume large amounts of ethanol or have a history of liver disease.
- Renal impairment: Use aspirin with caution in patients with mild-to-moderate renal impairment (only at high dosages); avoid in severe impairment.

Special populations:

- Pediatrics: Combination product is not appropriate for use in children.
- Surgical patients: Should avoid ASA if possible in surgical patients, for 1-2 weeks prior to surgery, to reduce the risk of excessive bleeding.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.
- Liver function tests: Must be monitored by periodic laboratory assessment.

Pregnancy Risk FactorX
Pregnancy ConsiderationsSee individual agents.
LactationEnters breast milk/contraindicated
Adverse ReactionsClinical studies of this combination product have not been conducted. See individual agents.
Metabolism/Transport Effects

Aspirin: **Substrate** of CYP2C9 (minor)

Pravastatin: **Substrate** of CYP3A4 (minor); **Inhibits** CYP2C9 (weak), 2D6 (weak), 3A4 (weak)

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Colchicine: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Colchicine may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

CycloSPORINE: May increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

DAPTOmycin: HMG-CoA Reductase Inhibitors may enhance the adverse/toxic effect of DAPTOmycin. Specifically, the risk of skeletal muscle toxicity may be increased. Management: Consider temporarily stopping HMG-CoA reductase inhibitor therapy prior to daptomycin. If used together, regular (i.e., at least weekly) monitoring of CPK concentrations is recommended. *Risk D: Consider therapy modification*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Fenofibrate: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Gemfibrozil: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Gemfibrozil may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Niacin: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Niacinamide: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): HMG-CoA Reductase Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsSee individual agents.

Monitoring ParametersPravastatin: Obtain baseline LFTs and total cholesterol profile; creatine phosphokinase. Repeat LFTs prior to elevation of dose. May be measured when clinically indicated and/or periodically thereafter.

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsPravastatin: Obtain baseline LFTs and total cholesterol profile; creatine phosphokinase. Repeat LFTs prior to elevation of dose. May be measured when clinically indicated and/or periodically thereafter.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Combination package (Pravigard™ PAC) [each administration card contains] [DSC]:

81/20:

Tablet: Aspirin, buffered 81 mg (5/card) [contains calcium carbonate, and magnesium oxide, and magnesium carbonate]

Tablet (Pravachol®): Pravastatin sodium 20 mg (5/card) [contains lactose]

81/40:

Tablet: Aspirin, buffered 81 mg (5/card) [contains calcium carbonate, and magnesium oxide, and magnesium carbonate]

Tablet (Pravachol®): Pravastatin sodium 40 mg (5/card) [contains lactose]

81/80:

Tablet: Aspirin, buffered 81 mg (5/card) [contains calcium carbonate, and magnesium oxide, and magnesium carbonate]

Tablet (Pravachol®): Pravastatin sodium 80 mg (5/card) [contains lactose]

325/20:

Tablet: Aspirin, buffered 325 mg (5/card) [contains calcium carbonate, and magnesium oxide, and magnesium carbonate]

Tablet (Pravachol®): Pravastatin sodium 20 mg (5/card) [contains lactose]

325/40:

Tablet: Aspirin, buffered 325 mg (5/card) [contains calcium carbonate, and magnesium oxide, and magnesium carbonate]

Tablet (Pravachol®): Pravastatin sodium 40 mg (5/card) [contains lactose]

325/80:

Tablet: Aspirin, buffered 325 mg (5/card) [contains calcium carbonate, and magnesium oxide, and magnesium carbonate]

Tablet (Pravachol®): Pravastatin sodium 80 mg (5/card) [contains lactose]

Generic AvailableNo

ManufacturerBristol-Myers Squibb

Pricing: U.S. (www.drugstore.com)

Misc (Pravigard Pac)

81-40 mg (30): $146.16

Mechanism of Action

Aspirin: Inhibits prostaglandin synthesis, acts on the hypothalamus heat-regulating center to reduce fever, blocks prostaglandin synthetase action which prevents formation of the platelet-aggregating substance thromboxane A_2

Pravastatin: Competitive inhibitor of 3-hydroxy-3-methylglutaryl coenzyme A (HMG-CoA) reductase, which is the rate-limiting enzyme involved in *de novo* cholesterol synthesis.

Pharmacodynamics/KineticsSee individual agents.

Dental Health Professional ConsiderationsThere is no scientific evidence to warrant discontinuance of aspirin prior to dental surgery. Patients taking one aspirin tablet daily as an antithrombotic and who require dental surgery should be given special consideration in consultation with the physician before removal of the aspirin relative to prevention of postoperative bleeding.

The Food and Drug Administration (FDA), has issued a letter updating information and considerations regarding the use of ibuprofen (400 mg doses) in patients who are taking low dose aspirin (81 mg, immediate release; not enteric coated) for cardioprotection and stroke prevention. Ibuprofen, at these doses, may interfere with aspirin's antiplatelet effect depending upon when it is administered. Patients initiated on aspirin first (for ~1 week) then ibuprofen (400 mg 3 times/day for 10 days) seem to maintain aspirin's platelet effect (Cryer B, 2005). Ibuprofen has the greatest impact on aspirin if administered less than 8 hours before aspirin (Catella-Lawson F, 2001).

Patients may require counseling about the appropriate timing of ibuprofen dosing in relationship to aspirin therapy. With occasional use of ibuprofen, a clinically-significant interaction with aspirin in unlikely. To avoid interference during chronic dosing, a single dose of ibuprofen should be taken 30-120 minutes after aspirin ingestion or at least 8 hours should elapse after ibuprofen dosing before giving aspirin (FDA, 2006; Catella-Lawson F, 2001).

The clinical implications of the interaction are unclear. There have not been any clinical endpoint studies conducted at this time. Avoidance of this interaction is potentially important because aspirin's vascular protection could be decreased or negated.

Other nonselective NSAIDs may have potential for a similar interaction with aspirin. Such has been described with naproxen (Capone ML, 2005). Acetaminophen does not appear to interfere with the antiplatelet effect of aspirin. Other clinical scenarios (use of smaller ibuprofen doses, other aspirin products, other doses of aspirin) have not been evaluated.

Additional information is available at: http://www.fda.gov/cder/drug/infopage/aspirin/default.htm

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Aspirin: As with all drugs which may affect hemostasis, bleeding is associated with aspirin. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables including dosage, concurrent use of multiple agents which alter hemostasis, and patient susceptibility. Many adverse effects of aspirin are dose related, and are rare at low dosages. Other serious reactions are idiosyncratic, related to allergy or individual sensitivity (see Dental Comment).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness

Mental Health: Effects on Psychiatric TreatmentAspirin may cause leukopenia; use caution with clozapine and carbamazepine; may also displace valproic acid from binding sites resulting in an increase of unbound drug; monitor for toxicity.

Cardiovascular ConsiderationsHMG-CoA reductase inhibitors are effective in primary and secondary prevention of cardiovascular events in patients with hyperlipidemia. For primary prevention, a patient's major risk factors (cigarette smoking, hypertension or currently taking antihypertensives, low HDL-C, family history, age, gender) should be evaluated. Patients with multiple risk factors (≥2) require more intensive therapy guided by the calculation of a 10-year absolute CHD risk (eg, the percent probability of having a CHD event in next 10 years). An individual's 10-year absolute CHD risk can be calculated at www.med-decisions.com/cvtool/phys/phys.html. LDL cholesterol goals, therapeutic lifestyle changes, and drug therapy are determined based upon a patient's risk factor profile.

Primary prevention trials show that cholesterol-lowering drugs reduce the risk of major coronary events, coronary death, and cerebrovascular events even in the first 6-12 months of use. The WOSCOP trial suggested a trend towards enhanced survival using pravastatin in their patients (mean LDL-cholesterol of 192 mg/dL and no history of MI). In a recent trial (Sever, 2003), patients with HTN and at least three other risk factors were randomized to 10 mg daily of atorvastatin or placebo. These patients had a total nonfasting cholesterol <250 mg/dL before treatment. LDL-C levels were 132 mg/dL before treatment and fell to an average of 90 mg/dL in the atorvastatin-treated group. There was a significant reduction in stroke, cardiovascular events, and coronary events in the atorvastatin-treated group as compared to the placebo group. There was no difference in mortality between the groups.

Secondary prevention trials indicate that "statin" therapy reduces mortality, major coronary events, coronary artery procedures, and stroke. The Heart Protection Study proved that lowering serum cholesterol levels reduces the rate of major vascular events among high-risk individuals with documented vascular disease (CHD, cerebrovascular, peripheral vascular) or diabetes regardless of initial cholesterol concentrations. PROVE IT is a randomized, double-blind trial evaluating hospitalized patients with acute coronary syndrome to determine the effects of intense LDL-C lowering therapy. Four thousand patients with an LDL-C levels of 106 mg/dL were randomized to pravastatin 40 mg daily or atorvastatin 80 mg daily. After 2 years, the combined cardiovascular endpoint (death, MI, unstable angina requiring hospitalization, revascularization and stroke) was ~26% in the pravastatin patients (median LDL-C 95 mg/dL) and ~22% in the atorvastatin treated patients (median LDL-C 62 mg/dL).

LaRosa and colleagues assessed the efficacy and safety of lowering LDL cholesterol <100 mg/dL in patients with stable coronary heart disease (LaRosa, 2005). Ten thousand and one patients with baseline LDL levels <130 mg/dL were randomized to atorvastatin 10 mg or 80 mg daily and followed for a median of 4.9 years. The primary endpoint was the occurrence of the first major cardiovascular event (death from CVD, MI, resuscitation after cardiac arrest, or stroke). A primary event occurred in 434 patients (8.7%) receiving 80 mg daily (mean LDL 77 mg/dL) and 548 patients (10.9%) receiving 10 mg dose (mean LDL 101 mg/dL) (95% CI, 0.69-0.89; p <0.001). There was no mortality difference between the two treatment groups.

HMG-CoA reductase inhibitors decrease levels of high-sensitivity C-reactive protein (hs-CRP). They also possess pleiotropic properties including improved endothelial function, reduced inflammation at the site of the coronary plaque, inhibition of platelet aggregation, and anticoagulant effects. These nonlipid effects may be beneficial when HMG-CoA reductase inhibitors are introduced early in the management of acute coronary syndromes (de Denus, 2002).

Myopathy: Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years of age), women more frequently than men, small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, drug interactions (use with caution or avoid). The combination of a HMG-CoA reductase inhibitor plus nicotinic acid seems to carry a lower risk of myopathy than does a HMG-CoA reductase inhibitor plus a fibrate. Other medications, when used concurrently, may enhance the risk of myopathy associated with statins; these include drugs that inhibit CYP3A4 isoenzymes (lovastatin, simvastatin, atorvastatin) or CYP2C9 isoenzymes (fluvastatin). HMG-CoA reductase inhibitors may exacerbate exercise-induced skeletal muscle injury. Many experts favor getting a baseline creatine kinase (CK) measurement before initiating therapy (asymptomatic CK elevations are common). Obtain a CK measurement if patient complains of muscle soreness, tenderness, or pain.

Anesthesia and Critical Care Concerns/Other ConsiderationsBased on the pravastatin component: **Myopathy:** Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years), gender (occurs in women more frequently than men), small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, and drug interactions (use with caution or avoid).

Based on current research, HMG-CoA reductase inhibitors should be continued in the perioperative period. Postoperative discontinuation of statin therapy is associated with an increased risk of cardiac morbidity and mortality.

Canadian Brand NamesAsaphen; Asaphen E.C.; Entrophen®; Novasen

Pharmacologic CategorySalicylate

Use: Labeled IndicationsTreatment of mild-to-moderate pain, inflammation, and fever; may be used as prophylaxis of myocardial infarction; prophylaxis of stroke and/or transient ischemic episodes; management of rheumatoid arthritis, rheumatic fever, osteoarthritis, and gout (high dose); adjunctive therapy in revascularization procedures (coronary artery bypass graft [CABG], percutaneous transluminal coronary angioplasty [PTCA], carotid endarterectomy), stent implantation

Use: Unlabeled/InvestigationalLow doses have been used in the prevention of pre-eclampsia, complications associated with autoimmune disorders such as lupus or antiphospholipid syndrome

Use: DentalTreatment of postoperative pain

Dosing: Adults

Acute ischemic stroke: Oral: 150-325 mg once daily, initiated within 48 hours (in patients who are not candidates for alteplase and not receiving systemic anticoagulation)

Analgesic and antipyretic:

Oral: 325-650 mg every 4-6 hours up to 4 g/day

Rectal: 300-600 mg every 4-6 hours up to 4 g/day

Anti-inflammatory: Oral: Initial: 2.4-3.6 g/day in divided doses; usual maintenance: 3.6-5.4 g/day; monitor serum concentrations

Atrial fibrillation (in patients not candidates for warfarin or at low risk of ischemic stroke): Oral: 75-325 mg once daily

Bioprosthetic aortic valve: Oral: 50-100 mg once daily; usual dose: 81 mg once daily

Bioprosthetic mitral valve (following 3 months of anticoagulation): Oral: 50-100 mg once daily; usual dose: 81 mg once daily

CABG: Oral: 75-100 mg once daily (usual dose: 81 mg) initiated 6 hours following surgery; if bleeding prevents administration at 6 hours after CABG, initiate as soon as possible

CABG (internal mammary bypass graft): Oral: 75-162 mg once daily

Carotid artery stenting: Oral: 81-325 mg once daily beginning at least 24 hours (preferably 4 days) prior to procedure with concomitant clopidogrel

Carotid endarterectomy: Oral: 50-100 mg once daily preoperatively and daily thereafter; usual dose: 81 mg once daily

Infrainguinal arterial reconstruction/bypass: Oral: 75-100 mg once daily (begin preoperatively); usual dose: 81 mg once daily

Mechanical heart valve (with additional risk factors for thromboembolism): Oral: 50-100 mg once daily (in addition to warfarin); usual dose: 81 mg once daily

Mitral annular calcification (with documented stroke, TIA, or systemic embolism): Oral: 50-100 mg once daily; usual dose: 81 mg once daily

Mitral valve prolapse (with documented stroke or TIA): Oral: 50-100 mg once daily; usual dose: 81 mg once daily

Myocardial infarction (primary prevention): Oral: 75-162 mg once daily (Antman, 2004) **or** 75-100 mg (usual dose: 81 mg) once daily (Hirsh, 2008)

Non-ST-segment elevation myocardial infarction (NSTEMI): Oral: Initial: 162-325 mg; Maintenance: 75-100 mg once daily indefinitely; usual maintenance dose: 81 mg once daily

PCI: Oral: Initial: 75-325 mg (300-325 mg in aspirin native patients) starting at least 2 hours (preferably 24 hours) before procedure; post procedure: 162-325 mg once daily (dose and duration varies with type of stent implanted); **Note:** Dose may be reduced to 75-162 mg once daily after appropriate duration based on stent-type is complete

Pericarditis associated with myocardial infarction: Oral: 162-325 mg once daily; doses as high as 650 mg every 4-6 hours may be required

Peripheral arterial disease: 75-100 mg once daily; usual dose: 81 mg once daily

Pre-eclampsia prevention (unlabeled use): 60-81 mg once daily (usual dose: 81 mg) during gestational weeks 13-26 (patient selection criteria not established)

Prosthetic valve thromboprophylaxis in pregnancy: 75-100 mg once daily; usual dose: 81 mg once daily

ST-segment elevation myocardial infarction (STEMI): Initial: 162-325 mg given on presentation (patient should chew nonenteric-coated aspirin especially if not taking before presentation); for patients unable to take oral, may use rectal suppository (300 mg). Maintenance (secondary prevention): 75-162 mg once daily indefinitely

Stroke (cardioembolic; anticoagulation contraindicated): Oral: 75-325 mg once daily

Stroke/TIA (noncardioembolic; secondary prevention): Oral: 50-325 mg once daily (Adams, 2008) **or** 50-100 mg once daily; usual dose: 81 mg once daily (Hirsh, 2008)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Analgesic and antipyretic: Oral, rectal: 10-15 mg/kg/dose every 4-6 hours, up to a total of 4 g/day

Anti-inflammatory: Oral: Initial: 60-90 mg/kg/day in divided doses; usual maintenance: 80-100 mg/kg/day divided every 6-8 hours; monitor serum concentrations

Antiplatelet effects: Oral: Adequate pediatric studies have not been performed; pediatric dosage is derived from adult studies and clinical experience and is not well established; suggested doses have ranged from 3-5 mg/kg/day to 5-10 mg/kg/day given as a single daily dose. Doses are rounded to a convenient amount (eg, $^{1}/_{2}$ of 81 mg tablet).

Mechanical prosthetic heart valves: Oral: 6-20 mg/kg/day given as a single daily dose (used in combination with an oral anticoagulant in children who have systemic embolism despite adequate oral anticoagulation therapy (INR 2.5-3.5) and used in combination with low-dose anticoagulation (INR 2-3) and dipyridamole when full-dose oral anticoagulation is contraindicated)

Blalock-Taussig shunts: Oral: 3-5 mg/kg/day given as a single daily dose

Kawasaki disease: Oral: 80-100 mg/kg/day divided every 6 hours; monitor serum concentrations; after fever resolves: 3-5 mg/kg/day once daily; in patients without coronary artery abnormalities, give lower dose for at least 6-8 weeks or until ESR and platelet count are normal; in patients with coronary artery abnormalities, low-dose aspirin should be continued indefinitely

Antirheumatic: Oral: 60-100 mg/kg/day in divided doses every 4 hours

Dosing: Renal Impairment

Cl_{cr} <10 mL/minute: Avoid use.

Dialyzable (50% to 100%)

Dosing: Hepatic ImpairmentAvoid use in severe liver disease.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralDo not crush sustained release or enteric coated tablet. Administer with food or a full glass of water to minimize GI distress. For acute myocardial infarction, have patient chew tablet.

Dietary ConsiderationsTake with food or large volume of water or milk to minimize GI upset.

StorageKeep suppositories in refrigerator; do not freeze. Hydrolysis of aspirin occurs upon exposure to water or moist air, resulting in salicylate and acetate, which possess a vinegar-like odor. Do not use if a strong odor is present.

ContraindicationsHypersensitivity to salicylates, other NSAIDs, or any component of the formulation; asthma; rhinitis; nasal polyps; inherited or acquired bleeding disorders (including factor VII and factor IX deficiency); do not use in children (<16 years of age) for viral infections (chickenpox or flu symptoms), with or without fever, due to a potential association with Reye's syndrome; pregnancy (3rd trimester especially)

Allergy Considerations

- Salicylate Allergy/Sensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Salicylate sensitivity: Patients with sensitivity to tartrazine dyes, nasal polyps, and asthma may have an increased risk of salicylate sensitivity.

- Tinnitus: Discontinue use if tinnitus or impaired hearing occurs.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with platelet and bleeding disorders.

- Dehydration: Use with caution in patients with dehydration.

- Ethanol use: Heavy ethanol use (>3 drinks/day) can increase bleeding risks.

- Gastrointestinal disease: Use with caution in patients with erosive gastritis or peptic ulcer disease.

- Hepatic impairment: Avoid use in severe severe hepatic failure.

- Renal impairment: Use with caution in patients with mild-to-moderate renal impairment (only at high dosages); avoid in severe impairment.

Concurrent drug therapy issues:

- Alteplase: In the treatment of acute ischemic stroke, avoid aspirin for 24 hours following administration of alteplase; administration within 24 hours increases the risk of hemorrhagic transformation.

Special populations:

- Pediatrics: When used for self-medication (OTC labeling): Children and teenagers who have or are recovering from chickenpox or flu-like symptoms should not use this product. Changes in behavior (along with nausea and vomiting) may be an early sign of Reye's syndrome; patients should be instructed to contact their healthcare provider if these occur.

- Surgical patients: ASA should be avoided (if possible) in surgical patients for 1-2 weeks prior to surgery, to reduce the risk of excessive bleeding (except in patients with cardiac stents that have not completed their full course of dual antiplatelet therapy [aspirin, clopidogrel]; patient specific situations need to be discussed with cardiologist; AHA/ACC/SCAI/ACS/ADA Science Advisory provides recommendations).

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from nonsteroidal anti-inflammatory agents. As much as 60% of elderly with GI complications to NSAIDs can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only prophylactic agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (full-dose aspirin in 3rd trimester - expert analysis)

Pregnancy ConsiderationsSalicylates have been noted to cross the placenta and enter fetal circulation. Adverse effects reported in the fetus include mortality, intrauterine growth retardation, salicylate intoxication, bleeding abnormalities, and neonatal acidosis. Use of aspirin close to delivery may cause premature closure of the ductus arteriosus. Adverse effects reported in the mother include anemia, hemorrhage, prolonged gestation, and prolonged labor. Aspirin has been used for the prevention of pre-eclampsia; however, the ACOG currently recommends that it not be used in low-risk women. Low-dose aspirin is used to treat complications resulting from antiphospholipid syndrome in pregnancy (either primary or secondary to SLE). In general, low doses during pregnancy needed for the treatment of certain medical conditions have not been shown to cause fetal harm, however, discontinuing therapy prior to delivery is recommended. Use of safer agents for routine management of pain or headache should be considered.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsLow amounts of aspirin can be found in breast milk. Milk/plasma ratios ranging from 0.03-0.3 have been reported. Peak levels in breast milk are reported to be at ~9 hours after a dose. Metabolic acidosis was reported in one infant following an aspirin dose of 3.9 g/day in the mother. The AAP states that aspirin should be used with caution while breast-feeding. The WHO considers occasional doses of aspirin to be compatible with breast-feeding, but to avoid long-term therapy and consider monitoring the infant for adverse effects. Other sources suggest avoiding aspirin while breast-feeding due to the theoretical risk of Reye's syndrome.

Adverse ReactionsAs with all drugs which may affect hemostasis, bleeding is associated with aspirin. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables including dosage, concurrent use of multiple agents which alter hemostasis, and patient susceptibility. Many adverse effects of aspirin are dose related, and are rare at low dosages. Other serious reactions are idiosyncratic, related to allergy or individual sensitivity. Accurate estimation of frequencies is not possible. The reactions listed below have been reported for aspirin.

Cardiovascular: Dysrhythmias, edema, hypotension, tachycardia

Central nervous system: Agitation, cerebral edema, coma, confusion, dizziness, fatigue, headache, hyperthermia, insomnia, lethargy, nervousness

Dermatologic: Angioedema, rash, urticaria

Endocrine & metabolic: Acidosis, dehydration, hyperglycemia, hypoglycemia (children), hyperkalemia, hypernatremia (buffered forms)

Gastrointestinal: Duodenal ulcers, dyspepsia, epigastric discomfort, gastric erosions, gastric erythema, gastrointestinal ulceration (6% to 31%), heartburn, nausea, stomach pain, vomiting

Hematologic: Anemia, bleeeding, coagulopathy, disseminated intravascular coagulation (DIC), hemolytic anemia, iron-deficiency anemia, prothrombin times prolonged, thrombocytopenia, Hepatic: Hepatitis (reversible), hepatotoxicity, transaminases increased

Neuromuscular & skeletal: Rhabdomyolysis, weakness, acetabular bone destruction (OA)

Otic: Hearing loss, tinnitus

Renal: BUN increased, interstitial nephritis, papillary necrosis, proteinuria, renal impairment, renal failure (including cases caused by rhabdomyolysis), serum creatinine increased

Respiratory: Asthma, bronchospasm, dyspnea, hyperpnea, laryngeal edema, noncardiogenic pulmonary edema, respiratory alkalosis, tachypnea

Miscellaneous: Anaphylaxis, low birth weight, peripartum bleeding, prolonged pregnancy and labor, Reye's syndrome, stillbirths

Postmarketing and/or case reports: Cholestatic jaundice, colitis, colonic ulceration, conduction defect and atrial fibrillation (toxicity), coronary artery spasm, delirium, esophageal stricture, esophageal hematoma, esophagitis with esophageal ulcer, ischemic brain infarction, oral mucosal ulcers (aspirin-containing chewing gum), periorbital edema, rectal stenosis (suppository), rhinosinusitis

Metabolism/Transport Effects **Substrate** of CYP2C9 (minor)

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal damage).

Food: Food may decrease the rate but not the extent of oral absorption.

Folic acid: Hyperexcretion of folate; folic acid deficiency may result, leading to macrocytic anemia.

Iron: With chronic aspirin use and at doses of 3-4 g/day, iron-deficiency anemia may result.

Sodium: Hypernatremia resulting from buffered aspirin solutions or sodium salicylate containing high sodium content. Avoid or use with caution in CHF or any condition where hypernatremia would be detrimental.

Benedictine liqueur, prunes, raisins, tea, and gherkins: Potential salicylate accumulation.

Fresh fruits containing vitamin C: Displace drug from binding sites, resulting in increased urinary excretion of aspirin.

Herb/Nutraceutical: Avoid cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, red clover, horse chestnut, green tea, ginseng (all have additional antiplatelet activity). Limit curry powder, paprika, licorice; may cause salicylate accumulation. These foods contain 6 mg salicylate/100 g. An ordinarily American diet contains 10-200 mg/day of salicylate.

Test InteractionsFalse-negative results for glucose oxidase urinary glucose tests (Clinistix®); false-positives using the cupric sulfate method (Clinitest®); also, interferes with Gerhardt test, VMA determination; 5-HIAA, xylose tolerance test and T_3 and T_4

Reference RangeTiming of serum samples: Peak levels usually occur 2 hours after ingestion. Salicylate serum concentrations correlate with the pharmacological actions and adverse effects observed. The serum salicylate concentration (mcg/mL) and the corresponding clinical correlations are as follows: See table.

Serum Salicylate: Clinical Correlations

Serum Salicylate Concentration (mcg/mL)	**Desired Effects**	**Adverse Effects / Intoxication**
~100	Antiplatelet Antipyresis Analgesia	GI intolerance and bleeding, hypersensitivity, hemostatic defects
150-300	Anti-inflammatory	Mild salicylism
250-400	Treatment of rheumatic fever	Nausea/vomiting, hyperventilation, salicylism, flushing, sweating, thirst, headache, diarrhea, and tachycardia
>400-500		Respiratory alkalosis, hemorrhage, excitement, confusion, asterixis, pulmonary edema, convulsions, tetany, metabolic acidosis, fever, coma, cardiovascular collapse, renal and respiratory failure

Nursing: Physical Assessment/Monitoring**Do not use for persons with allergic reaction to salicylate or other NSAIDs.** Assess other medications patient may be taking for additive or adverse interactions. Monitor therapeutic effectiveness and for signs of adverse reactions or overdose at beginning of therapy and periodically with long-term therapy. Assess knowledge/teach patient appropriate use. Teach patient to monitor for adverse reactions, adverse reactions to report, and appropriate interventions to reduce side effects.

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Adverse reactions can occur with overuse. Take with food or milk. Do not use aspirin with strong vinegar-like odor. Do not crush or chew extended release products. While using this medication, avoid alcohol, excessive amounts of vitamin C, or salicylate-containing foods (eg, curry powder, prunes, raisins, tea, or licorice), other prescription or OTC medications containing aspirin or salicylate, or other NSAIDs without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience nausea, vomiting, gastric discomfort (frequent mouth care, small frequent meals, sucking lozenges, or chewing gum may help); GI bleeding, ulceration, or perforation (can occur with or without pain); or discoloration of stool (pink/red). Stop taking aspirin and report ringing in ears; persistent stomach pain; unresolved nausea or vomiting; respiratory difficulty or shortness of breath; unusual bruising or bleeding (mouth, urine, stool); or skin rash. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Caplet:

Bayer® Aspirin Extra Strength: 500 mg

Bayer® Aspirin Regimen Regular Strength: 325 mg

Bayer® Genuine Aspirin: 325 mg

Bayer® Plus Extra Strength: 500 mg [contains calcium carbonate]

Bayer® with Heart Advantage: 81 mg [contains phytosterols, tartrazine]

Bayer® Women's Aspirin Plus Calcium: 81 mg [contains elemental calcium 300 mg]

Caplet, buffered:

Ascriptin® Maximum Strength: 500 mg [contains aluminum hydroxide, calcium carbonate, and magnesium hydroxide]

Gum:

Aspergum®: 227 mg [cherry or orange flavor]

Suppository, rectal: 300 mg, 600 mg

Tablet: 325 mg

Aspercin, Aspirtab: 325 mg

Bayer® Genuine Aspirin: 325 mg

Tablet, buffered: 325 mg

Ascriptin®: 325 mg [contains aluminum hydroxide, calcium carbonate, and magnesium hydroxide]

Buffasal: 325 mg [contains magnesium oxide]

Bufferin®: 325 mg [contains calcium carbonate, magnesium oxide, and magnesium carbonate; contains calcium 65 mg/tablet, magnesium 50 mg/tablet]

Bufferin® Extra Strength: 500 mg [contains calcium carbonate, magnesium oxide, and magnesium carbonate; contains calcium 90 mg/tablet, magnesium 70 mg/tablet]

Buffinol: 325 mg [contains magnesium oxide]

Tablet, chewable: 81 mg

Bayer® Aspirin Regimen Children's: 81 mg [cherry or orange flavor]

St. Joseph® Adult Aspirin: 81 mg [orange flavor]

Tablet, controlled release:

ZORprin®: 800 mg

Tablet, delayed release, enteric coated:

Easprin®: 975 mg

Tablet, enteric coated: 81 mg, 325 mg, 500 mg, 650 mg, 975 mg [DSC]

Bayer® Aspirin Regimen Adult Low Dose, Ecotrin® Low Strength, St. Joseph Adult Aspirin: 81 mg

Ecotrin®, Genacote™: 325 mg

Ecotrin® Maximum Strength: 500 mg

Halfprin®: 81 mg, 162 mg

Generic AvailableYes: Excludes gum

Pricing: U.S. (www.drugstore.com)

Tablet, controlled release (Zorprin)

800 mg (100): $125.53

Tablet, EC (Aspirin)

975 mg (90): $11.25

Tablets (Aspirin)

325 mg (100): $11.99

Mechanism of ActionIrreversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antiplatelet, antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Duration: 4-6 hours

Absorption: Rapid

Distribution: V_d: 10 L; readily into most body fluids and tissues

Metabolism: Hydrolyzed to salicylate (active) by esterases in GI mucosa, red blood cells, synovial fluid, and blood; metabolism of salicylate occurs primarily by hepatic conjugation; metabolic pathways are saturable

Bioavailability: 50% to 75% reaches systemic circulation

Half-life elimination: Parent drug: 15-20 minutes; Salicylates (dose dependent): 3 hours at lower doses (300-600 mg), 5-6 hours (after 1 g), 10 hours with higher doses

Time to peak, serum: ~1-2 hours

Excretion: Urine (75% as salicyluric acid, 10% as salicylic acid)

Dental Health Professional ConsiderationsThere is no scientific evidence to warrant discontinuance of aspirin prior to dental surgery. Patients taking one aspirin tablet daily as an antithrombotic and who require dental surgery should be given special consideration in consultation with the physician before removal of the aspirin relative to prevention of postoperative bleeding.

The Food and Drug Administration (FDA), has issued a letter updating information and considerations regarding the use of ibuprofen (400 mg doses) in patients who are taking low dose aspirin (81 mg, immediate release; not enteric coated) for cardioprotection and stroke prevention. Ibuprofen, at these doses, may interfere with aspirin's antiplatelet effect depending upon when it is administered. Patients initiated on aspirin first (for ~1 week) then ibuprofen (400 mg 3 times/day for 10 days) seem to maintain aspirin's platelet effect (Cryer B, 2005). Ibuprofen has the greatest impact on aspirin if administered less than 8 hours before aspirin (Catella-Lawson F, 2001).

Patients may require counseling about the appropriate timing of ibuprofen dosing in relationship to aspirin therapy. With occasional use of ibuprofen, a clinically-significant interaction with aspirin in unlikely. To avoid interference during chronic dosing, a single dose of ibuprofen should be taken 30-120 minutes after aspirin ingestion or at least 8 hours should elapse after ibuprofen dosing before giving aspirin (FDA, 2006; Catella-Lawson F, 2001).

The clinical implications of the interaction are unclear. There have not been any clinical endpoint studies conducted at this time. Avoidance of this interaction is potentially important because aspirin's vascular protection could be decreased or negated.

Other nonselective NSAIDs may have potential for a similar interaction with aspirin. Such has been described with naproxen (Capone ML, 2005). Acetaminophen does not appear to interfere with the antiplatelet effect of aspirin. Other clinical scenarios (use of smaller ibuprofen doses, other aspirin products, other doses of aspirin) have not been evaluated.

Additional information is available at: http://www.fda.gov/cder/drug/infopage/aspirin/default.htm

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: As with all drugs which may affect hemostasis, bleeding is associated with aspirin. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables including dosage, concurrent use of multiple agents which alter hemostasis, and patient susceptibility. Many adverse effects of aspirin are dose related, and are rare at low dosages. Other serious reactions are idiosyncratic, related to allergy or individual sensitivity (see Dental Comment).

Aspirin and clopidogrel (Plavix®) in combination is the primary prevention strategy against stent thrombosis after placement of drug-eluting metal stents in coronary patients. Premature discontinuation of this combination antiplatelet therapy strongly increases the risk of a catastrophic event of stent thrombosis leading to myocardial infarction and/or death, so says a science advisory issued in January 2007 from the American Heart Association in collaboration with the American Dental Association and other professional healthcare organizations. The advisory stresses a 12-month therapy of aspirin and Plavix® combination after placement of a drug-eluting stent in order to prevent thrombosis at the stent site. Any elective surgery should be postponed for 1 year after stent implantation, and if surgery must be performed, consideration should be given to continuing the antiplatelet therapy during the perioperative period in high-risk patients with drug-eluting stents.

This advisory was issued from a science panel made up of representatives from the American Heart Association (AHA), the American College of Cardiology, the Society for Cardiovascular Angiography and Interventions, the American College of Surgeons, the American Dental Association (ADA), and the American College of Physicians (Grines, 2007).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; may displace valproic acid from binding sites resulting in an increase of unbound drug; monitor for toxicity

Cardiovascular Considerations

Primary Prevention: The U.S. Preventive Services Task Force strongly recommends that clinicians discuss aspirin therapy for primary prevention of heart disease with adults who are at increased risk. The balance of benefits and harm is most favorable in patients at high risk for coronary heart disease (those with a 5-year risk ≥3%). Risk can be calculated at www.med-decisions.com. Adequate blood pressure control is necessary in hypertensive patients who are candidates for aspirin.

Secondary Prevention: In unstable angina, aspirin reduces the rate of refractory angina, nonfatal MI, and death. Aspirin reduces the rate of recurrent ischemia and infarction, stroke, and death following MI. In patients who have acute coronary syndrome (ACS) but are not already receiving aspirin, the first dose may be chewed to rapidly establish a high blood level.

Resistance: The definition of biochemical aspirin resistance is measurable, persistent platelet activation that occurs in patients prescribed a therapeutic dose of aspirin. Clinical aspirin resistance is considered aspirin treatment failure; the recurrence of some vascular event despite a regular therapeutic dose of aspirin. Proposed mechanisms of aspirin resistance include poor adherence with therapy, poor absorption, inadequate dosage, drug interactions, increased isoprostane activity, platelet hypersensitivity to agonists, increased COX-2 activity, COX-1 polymorphism, and platelet alloantigen 2 polymorphism of platelet glycoprotein IIIa. Aspirin resistance has been evaluated clinically. A stable group of 326 cardiovascular patients taking 325 mg of aspirin a day for >7 days was prospectively evaluated (Gum PA, 2003). Platelet aggregation was evaluated by optical platelet aggregation using ADP and AA. The primary outcome was defined as a composite of death, MI, or CVA. Seventeen (~5%) patients had biochemical aspirin resistance. Patients who were aspirin-resistant were more likely to have a CV event than those who were aspirin-sensitive (24% vs 10%, CI 1.1-8.9, p = 0.03). There have been other studies evaluating biochemical and clinical aspirin resistance; different methods have been used to determine aspirin resistance. Patient adherence has not been evaluated. Aspirin resistance is likely dose related, may be influenced by dynamic factors yet to be identified and further research is required.

Coronary Artery Stents: The AHA/ACC/SCAI/ACS/ADA Science Advisory (2007) published recommendations (*Circulation*, February 13, 2007) to prevent premature discontinuation of dual antiplatelet therapy (clopidogrel, aspirin) in patients with coronary artery stents. This advisory panel agreed with the 2004 ACC/AHA guidelines stressing the importance of 12 months of dual antiplatelet therapy after placement of a drug-eluting stent (DES) in patients who are not at high risk of bleeding. The advisory panel included these recommendations. Minor surgery, teeth cleaning, and tooth extraction can usually be performed without increased bleeding on the dual antiplatelet regimen. If increased bleeding is anticipated, then the procedure should be delayed until the antiplatelet regimen is completed. Elective procedures with a significant risk of bleeding should be postponed until the antiplatelet regimen is completed. The Advisory panel recommends healthcare providers who perform invasive or surgical procedures contact the patient's cardiologist before discontinuing antiplatelet therapy. For patients with drug-eluting stents who must undergo a procedure that requires discontinuation of thienopyridine therapy, aspirin should be continued if possible and the thienopyridine restarted as soon as possible after the procedure. "Bridging" stent patients with warfarin, other antithrombins, or glycoprotein IIb/IIIa agents is not supported by the Advisory Committee.

For the complete review and additional recommendations available at: http://www.acc.org/qualityandscience/clinical/pdfs/Final_Dual_Antiplatelet_Statement_010507.pdf. Last accessed January 19, 2007.

Drug Interactions: The question frequently arises as to whether or not concurrent NSAID use interferes with the antiplatelet effects of aspirin. It is known that if taken within 2 hours following an aspirin dose or if taken regularly in a patient on cardioprotective doses of aspirin, ibuprofen will interfere with the antiplatelet effects of aspirin. Less is known about the other NSAIDs, but some data are available. In a pharmacodynamic trial, diclofenac did not interfere with aspirin's antiplatelet effects after six straight days of combined use. In a retrospective analysis, diclofenac did not impact cardiovascular and all-cause morality when taken regularly in patients receiving daily aspirin. A subgroup analysis of the Physician's Health Study (a primary prevention trial) identified that the use of NSAIDs (specific agents were not identified) at <60 days/year did not diminish aspirin's ability to prevent an initial MI in contrast to taking NSAIDs more frequently. It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain first access to the active site. In either case, aspirin inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible).

Index TermsAcetylsalicylic Acid; ASA

Pharmacologic Category[Chemotherapy Regimen, Breast Cancer]

Regimen UseBreast cancer

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Doxorubicin: I.V.: 50 mg/m^2 day 1

[total dose/cycle = 50 mg/m^2]

Docetaxel: I.V.: 75 mg/m^2 day 1

[total dose/cycle = 75 mg/m^2]

Repeat cycle every 3 weeks

Variation 2:

Doxorubicin: I.V.: 60 mg/m^2 day 1

[total dose/cycle = 60 mg/m^2]

Docetaxel: I.V.: 60 mg/m^2

[total dose/cycle = 60 mg/m^2]

Repeat cycle every 3 weeks

Variation 3:

Doxorubicin: I.V.: 50 mg/m^2 day 1

[total dose/cycle = 50 mg/m^2]

Docetaxel: I.V.: 75 mg/m^2 day 1

[total dose/cycle = 75 mg/m^2]

Repeat cycle every 14 days

Variation 4:

Doxorubicin: I.V.: 50 mg/m^2 day 1

[total dose/cycle = 50 mg/m^2]

Docetaxel: I.V.: 60 mg/m^2 day 1

[total dose/cycle = 60 mg/m^2]

Repeat cycle every 3 weeks

Variation 5:

Doxorubicin: I.V.: 50 mg/m^2 day 1

[total dose/cycle = 50 mg/m^2]

Docetaxel: I.V.: 60 mg/m^2 day 1

[total dose/cycle = 60 mg/m^2]

Repeat cycle every 3-4 weeks

Variation 6:

Doxorubicin: I.V.: 56 mg/m^2 day 1

[total dose/cycle = 56 mg/m^2]

Docetaxel: I.V.: 75 mg/m^2 day 1

[total dose/cycle = 75 mg/m^2]

Repeat cycle every 3 weeks

Variation 7:

Doxorubicin: I.V.: 50 mg/m^2 day 1

[total dose/cycle = 50 mg/m^2]

Docetaxel: I.V.: 75 mg/m^2 day 2

[total dose/cycle = 75 mg/m^2]

Repeat cycle every 4 weeks

Atazanavir

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(at a za NA veer)
U.S. Brand NamesReyataz®
Canadian Brand NamesReyataz®
Pharmacologic CategoryAntiretroviral Agent, Protease Inhibitor
Use: Labeled IndicationsTreatment of HIV-1 infections in combination with at least two other antiretroviral agents

Note: In patients with prior virologic failure, coadministration with ritonavir is recommended.

Dosing: Adults

Treatment of HIV-1 infection: Oral:

Antiretroviral-naive patients: Atazanavir 300 mg once daily **plus** ritonavir 100 mg once daily **or** 400 mg once daily in patients unable to tolerate ritonavir

Antiretroviral-experienced patients: Atazanavir 300 mg once daily **plus** ritonavir 100 mg once daily. **Note:** Atazanavir without ritonavir is not recommended in antiretroviral-experienced patients with prior virologic failure.

Dosage adjustments for concomitant therapy: Oral:

Coadministration with efavirenz:

Antiretroviral-naive patients: Atazanavir 400 mg plus ritonavir 100 mg given with efavirenz 600 mg (all as a single daily dose)

Antiretroviral-experienced patients: Concurrent use not recommended due to decreased atazanavir exposure.

Coadministration with didanosine buffered or enteric-coated formulations: Administer atazanavir 2 hours before or 1 hour after didanosine buffered formulations

Coadministration with H_2 antagonists:

Antiretroviral-naive patients: Atazanavir 300 mg plus ritonavir 100 mg given simultaneously with, or at least 10 hours after an H_2 antagonist equivalent dose of ≤80 mg famotidine/day

Patients unable to tolerate ritonavir: Atazanavir 400 mg once daily given at least 2 hours before or at least 10 hours after an H_2 antagonist equivalent daily dose of ≤40 mg famotidine (single dose ≤20 mg)

Antiretroviral-experienced patients: Atazanavir 300 mg plus ritonavir 100 mg given simultaneously with, or at least 10 hours after an H_2 antagonist equivalent dose of ≤40 mg famotidine/day

With tenofovir: Increase atazanavir to 400 mg (plus ritonavir 100 mg) once daily

Coadministration with proton pump inhibitors:

Antiretroviral-naive patients: Atazanavir 300 mg plus ritonavir 100 mg given 12 hours after a proton pump inhibitor equivalent dose of ≤20 mg omeprazole/day

Antiretroviral-experienced patients: Concurrent use not recommended.

Antiretroviral-experienced patients: Concurrent use not recommended.

Coadministration with tenofovir: Atazanavir 300 mg plus ritonavir 100 mg given with tenofovir 300 mg (all as a single daily dose); if H_2 antagonist coadministered, increase atazanavir to 400 mg (plus ritonavir 100 mg) once daily

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Treatment of HIV-1 infection: Oral: Children ≥6 years and Adolescents:

Antiretroviral-naive patients:

15-24 kg: Atazanavir 150 mg once daily **plus** ritonavir 80 mg once daily

25-31 kg: Atazanavir 200 mg once daily **plus** ritonavir 100 mg once daily

32-38 kg: Atazanavir 250 mg once daily **plus** ritonavir 100 mg once daily

≥39 kg: Atazanavir 300 mg once daily **plus** 100 mg ritonavir once daily. **Note:** Treatment-naive patients ≥39 kg and ≥13 years of age who are unable to tolerate ritonavir, refer to adult dosing.

or

15-19 kg: Atazanavir 8.5 mg/kg/dose once daily (rounded to available capsule strengths) **plus** ritonavir 4 mg/kg once daily

≥20 kg: Atazanavir 7 mg/kg/dose once daily (round to available capsule strengths) (maximum 300 mg) **plus** ritonavir 4 mg/kg once daily

Antiretroviral-experienced patients: **Note:** Atazanavir without ritonavir is not recommended in antiretroviral-experienced patients with prior virologic failure:

25-31 kg: Atazanavir 200 mg once daily **plus** ritonavir 100 mg once daily

32-38 kg: Atazanavir 250 mg once daily **plus** ritonavir 100 mg once daily

≥39 kg: Atazanavir 300 mg once daily **plus** 100 mg ritonavir once daily

Dosage adjustments for concomitant therapy: Oral: Adolescents >13 years: Refer to adult dosing.

Dosing: Renal Impairment

Not on hemodialysis: No adjustment necessary

Hemodialysis:

Antiretroviral-naive patients: Use boosted therapy of atazanavir 300 mg with ritonavir 100 mg once daily

Antiretroviral-experienced patients: Not recommended.

Dosing: Hepatic Impairment

Mild-to-moderate hepatic insufficiency: Use with caution; if moderate insufficiency (Child-Pugh class B) and no prior virologic failure, reduce dose to 300 mg once daily.

Severe hepatic insufficiency (Child-Pugh class C): Not recommended.

Note: Patients with underlying hepatitis B or C may be at increased risk of hepatic decompensation. Combination therapy (with ritonavir) in patients with hepatic impairment not recommended.

Administration: Oral

Administer with food.

Dietary ConsiderationsShould be taken with food to enhance absorption.

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity (eg, Stevens-Johnson syndrome, erythema multiforme, or toxic skin eruptions) to atazanavir or any component of the formulation; concurrent therapy with cisapride, ergot derivatives (dihydroergotamine, ergonovine, ergotamine, methylergonovine), indinavir, irinotecan, lovastatin, midazolam (oral), pimozide, rifampin, simvastatin, St John’s wort, or triazolam

Warnings/Precautions

Concerns related to adverse effects:

- Elevated bilirubin: Asymptomatic elevations in bilirubin (unconjugated) occur commonly during therapy; consider alternative therapy if bilirubin is >5 times ULN. Evaluate alternative etiologies if transaminase elevations also occur.

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).

- Hypersensitivity reactions: Protease inhibitors have been associated with a variety of hypersensitivity events (some severe), including rash, anaphylaxis (rare), angioedema, bronchospasm, erythema multiforme, and/or Stevens-Johnson syndrome (rare). It is generally recommended to discontinue treatment if severe rash or moderate symptoms accompanied by other systemic symptoms occur.

- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.

- Nephrolithiasis: Cases have been reported in postmarketing surveillance; temporary or permanent discontinuation of therapy should be considered if symptoms develop.

Disease-related concerns:

- Conduction abnormalities: May prolong PR interval, use with caution in patients with pre-existing conduction abnormalities or with medications which prolong AV conduction (dosage adjustment required with some agents); rare cases of second-degree AV block have been reported.

- Diabetes: Changes in glucose tolerance, hyperglycemia, exacerbation of diabetes, DKA, and new-onset diabetes mellitus have been reported in patients receiving protease inhibitors.

- Hemophilia A or B: Use with caution in patients with hemophilia A or B; increased bleeding during protease inhibitor therapy has been reported.

- Hepatic impairment: Protease inhibitors may cause hepatitis and/or exacerbate pre-existing hepatic dysfunction; use with caution in patients with underlying hepatic disease, such as hepatitis B or C or cirrhosis; monitor closely.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers, and major CYP2C8 substrates; consider alternative agents that avoid or lessen the potential for CYP- or glucuronidation-mediated interactions. Contraindicated with drugs that are major CYP3A4 or UGT1A1 substrates (see Drug Interactions).

Special populations:

- Pediatrics: Optimal dosing in pediatric patients <6 years of age has not been established; do not use in children <3 months of age due to potential for kernicterus.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects not observed in animal studies. Pregnancy and protease inhibitors are both associated with an increased risk of hyperglycemia. Glucose levels should be closely monitored. Atazanavir crosses the human placenta in low/variable amounts; it is not known if atazanavir will exacerbate hyperbilirubinemia in neonates. Based on limited studies, normal dosing achieves adequate serum concentrations in pregnant women. Atazanavir is currently not recommended for use during pregnancy. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse ReactionsIncludes data from both treatment-naive and treatment-experienced patients. Percentages listed for adults unless otherwise specified.

>10%:

Dermatologic: Rash (5% to 21%; median onset 8 weeks)

Endocrine & metabolic: Cholesterol increased (≥240 mg/dL: 6% to 25%)

Gastrointestinal: Nausea (3% to 14%), amylase increased (14%)

Hepatic: Bilirubin increased (≥2.6 times ULN: 34% to 49%)

Neuromuscular & skeletal: CPK increased (5% to 11%)

Respiratory: Cough (children 21%)

2% to 10%:

Cardiovascular: AV block (first degree: 6%; second degree [children] 2%)

Central nervous system: Headache (1% to 6%; children 7%), peripheral neuropathy (<1% to 4%), insomnia (<1% to 3%), depression (2%), fever (2%; children 19%), dizziness (<1% to 2%)

Endocrine & metabolic: Triglycerides increased (<1% to 8%), hyperglycemia (≥251 mg/dL: 5%)

Gastrointestinal: Lipase increased (<1% to 5%), abdominal pain (4%), vomiting (3% to 4%; children 8%), diarrhea (1% to 3%; children 8%)

Hematologic: Neutropenia (3% to 7%), hemoglobin decreased (<1% to 5%), thrombocytopenia (up to 2%)

Hepatic: ALT increased (>5 times ULN: 4% to 9%; 15% to 25% in patients seropositive for hepatitis B and/or C), AST increased (>5 times ULN: 2% to 7%; 9% to 10% in patients seropositive for hepatitis B and/or C), jaundice (4% to 9%; children 13%)

Neuromuscular & skeletal: Myalgia (4%)

Respiratory: Rhinorrhea (children 6%)

<2%, postmarketing and/or case reports: Alopecia, arthralgia, AV block (second- and third-degree, rare), cholecystitis, cholelithiasis, cholestasis, diabetes mellitus, edema, erythema multiforme, immune reconstitution syndrome, left bundle branch block, macropapular rash, nephrolithiasis, pancreatitis, pruritus, QT_c prolongation, Stevens-Johnson syndrome

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (weak), 2C8 (strong), 2C9 (weak), 3A4 (strong), UGT1A1 (strong)

Drug Interactions

Abacavir: Protease Inhibitors may decrease the serum concentration of Abacavir. *Risk C: Monitor therapy*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amiodarone: Protease Inhibitors may decrease the metabolism of Amiodarone. *Risk X: Avoid combination*

Antacids: May decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Protease Inhibitors may decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Buprenorphine: Atazanavir may increase the serum concentration of Buprenorphine. *Risk C: Monitor therapy*

Calcium Channel Blockers (Dihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). Increased serum concentrations of the calcium channel blocker may increase risk of AV nodal blockade. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Protease Inhibitors. Protease Inhibitors may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cisapride: Protease Inhibitors may decrease the metabolism of Cisapride. The resultant increase in serum cisapride concentrations may result in QTc prolongation and malignant cardiac arrhythmias. *Risk X: Avoid combination*

Clarithromycin: Protease Inhibitors may diminish the therapeutic effect of Clarithromycin. Specifically, certain protease inhibitors may decrease formation of the active 14-hydroxy-clarithromycin metabolite, which may negatively impact clarithromycin effectiveness vs. H. influenzae and other non-MAC infections. Protease Inhibitors may increase the serum concentration of Clarithromycin. Clarithromycin dose adjustment in renally impaired patients may be needed. Clarithromycin may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): Protease Inhibitors may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk D: Consider therapy modification*

CycloSPORINE: Protease Inhibitors may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Strong) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Delavirdine: Protease Inhibitors may decrease the serum concentration of Delavirdine. Delavirdine may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Didanosine: May decrease the absorption of Atazanavir. Only the buffered formulations of didanosine are of concern. Atazanavir may decrease the serum concentration of Didanosine. Reported with enteric coated didanosine capsules. *Risk D: Consider therapy modification*

Digoxin: Protease Inhibitors may increase the serum concentration of Digoxin. Increased serum concentrations of digoxin may increase risk of AV nodal blockade. *Risk C: Monitor therapy*

Efavirenz: May decrease the serum concentration of Atazanavir. *Risk D: Consider therapy modification*

Enfuvirtide: Protease Inhibitors may increase the serum concentration of Enfuvirtide. Enfuvirtide may increase the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

Eplerenone: Protease Inhibitors may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Protease Inhibitors may decrease the metabolism of Ergot Derivatives. **Exceptions:** Cabergoline. *Risk X: Avoid combination*

Etravirine: Atazanavir may increase the serum concentration of Etravirine. Etravirine may decrease the serum concentration of Atazanavir. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

FentaNYL: Protease Inhibitors may decrease the metabolism of FentaNYL. *Risk C: Monitor therapy*

Fusidic Acid: Protease Inhibitors may decrease the metabolism of Fusidic Acid. Fusidic Acid may decrease the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Garlic: May decrease the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

H2-Antagonists: May decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: Protease Inhibitors may increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. **Exceptions:** Fluvastatin. *Risk D: Consider therapy modification*

Irinotecan: Atazanavir may increase the serum concentration of Irinotecan. The metabolism (via glucuronidation) of the active SN-38 metabolite may be primarily impacted by this interaction. *Risk X: Avoid combination*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Meperidine: Protease Inhibitors may enhance the adverse/toxic effect of Meperidine. Protease Inhibitors may decrease the serum concentration of Meperidine. Concentrations of the toxic Normeperidine metabolite may be increased. *Risk D: Consider therapy modification*

Nefazodone: Protease Inhibitors may decrease the metabolism of Nefazodone. *Risk C: Monitor therapy*

Nevirapine: May increase the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): May diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Phosphodiesterase 5 Inhibitors: Protease Inhibitors may decrease the metabolism of Phosphodiesterase 5 Inhibitors. Management: Dose restrictions for tadalafil, and/or sildenafil and vardenafil are recommended in combination with ritonavir, atazanavir, indinavir, darunavir and saquinavir. Consult specific prescribing information for detailed recommendations. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Protease Inhibitors may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Protease Inhibitors: May increase the serum concentration of other Protease Inhibitors. Management: Atazanavir--indinavir combination contraindicated. Amprenavir oral solution not recommended with ritonavir oral solution; tipranavir/ritonavir or atazanavir/ritonavir not recommended with other protease inhibitors. Other combos may require dose changes. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

QuiNIDine: Protease Inhibitors may decrease the metabolism of QuiNIDine. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifampin: May decrease the serum concentration of Atazanavir. *Risk X: Avoid combination*

Rifamycin Derivatives: Protease Inhibitors may decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Sirolimus: Protease Inhibitors may increase the serum concentration of Sirolimus. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Protease Inhibitors. *Risk X: Avoid combination*

Tacrolimus: Protease Inhibitors may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Temsirolimus: Protease Inhibitors may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tenofovir: May decrease the serum concentration of Atazanavir. Atazanavir may increase the serum concentration of Tenofovir. Management: When combined use required, tenofovir 300mg and atazanavir 300mg should be used together with ritonavir 100mg, all given as a single daily dose with food. Atazanavir without ritonavir should not be used with tenofovir. *Risk D: Consider therapy modification*

Theophylline Derivatives: Protease Inhibitors may decrease the serum concentration of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

TraZODone: Protease Inhibitors may increase the serum concentration of TraZODone. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Protease Inhibitors may increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Valproic Acid: Protease Inhibitors may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Warfarin: Atazanavir may increase the serum concentration of Warfarin. *Risk C: Monitor therapy*

Zidovudine: Protease Inhibitors may decrease the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Bioavailability of atazanavir increased when taken with food.

Herb/Nutraceutical: St John's wort (*Hypericum perforatum*) decreases serum concentrations of protease inhibitors and may lead to treatment failures; concurrent use is contraindicated.

Monitoring ParametersViral load, CD4, serum glucose; liver function tests, bilirubin, drug levels (with certain concomitant medications), ECG monitoring in patients with prolonged PR interval or with concurrent AV nodal blocking drugs

Nursing: Physical Assessment/MonitoringUse with caution in presence of hepatic dysfunction or hemophilia. Assess all other pharmacologic or herbal products patient may be taking for potential interactions or toxicity; dosing adjustments or alternative agents may be necessary (multiple liver enzyme interactions may increase or decrease levels/effects of drugs and increase potential for severe toxicity or loss of effectiveness). A list of medications that should not be used is available in each bottle and patients should be provided with this information. Assess therapeutic response (CD4 count, hepatic function) and adverse reactions at regular intervals during therapy (eg, hypersensitivity reaction [can be severe], gastrointestinal disturbance [nausea, vomiting, diarrhea] that can lead to dehydration and weight loss, hyperlipidemia and redistribution of body fat, rash, CNS effects [malaise, insomnia, abnormal thinking], electrolyte imbalance) at regular intervals during therapy. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions (eg, glucose testing [protease inhibitors may cause hyperglycemia or new-onset diabetes], use of barrier contraceptives [protease inhibitors may decrease effectiveness of oral contraceptives]), and adverse symptoms to report.

Monitoring: Lab TestsViral load, CD4, serum glucose; liver function tests, bilirubin, drug levels (with certain concomitant medications)

Patient EducationYou will be provided with a list of specific medications that should not be used during therapy; do not take any new prescriptions, over-the-counter medications, or herbal products (even if they are not on the list) without consulting prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. This drug is prescribed as one part of a multidrug combination; take exactly as directed for full course of therapy. May take with light meal (eg, dry toast, skim milk, corn flakes) to reduce GI upset. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. You may be susceptible to infection; avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber. You may be advised to check your glucose levels; medication can cause hyperglycemia. Frequent blood tests may be required with prolonged therapy. May cause body changes due to redistribution of body fat, facial atrophy, or breast enlargement (normal effects of drug); nausea, vomiting, or flatulence (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); muscle weakness or flank pain (consult prescriber for approved analgesic); headache or insomnia (consult prescriber for medication); or diarrhea (boiled milk, buttermilk, or yogurt may help). Inform prescriber immediately if you experience hypersensitivity (skin rash; swelling of face, mouth, or tongue; difficulty swallowing or breathing) or chest pain or palpitations. Report muscle numbness or tingling; unresolved persistent vomiting, diarrhea, or abdominal pain; change in color of stool or urine; or any persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug decreases the effect of oral contraceptives; use of alternative (nonhormonal) forms of contraception is recommended; consult prescriber for appropriate contraceptives. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as sulfate:

Reyataz®: 100 mg, 150 mg, 200 mg, 300 mg

Generic AvailableNo

ManufacturerBristol-Myers Squibb

Pricing: U.S. (www.drugstore.com)

Capsules (Reyataz)

150 mg (30): $489.90

200 mg (60): $919.94

300 mg (30): $918.91

Mechanism of ActionInhibits the HIV-1 protease; inhibition of the viral protease prevents cleavage of the gag-pol polyprotein resulting in the production of immature, noninfectious virus

Pharmacodynamics/Kinetics

Absorption: Rapid; enhanced with food

Protein binding: 86%

Metabolism: Hepatic, via multiple pathways including CYP3A4; forms two metabolites (inactive)

Half-life elimination: Unboosted therapy: 7-8 hours; Boosted therapy (with ritonavir): 9-18 hours

Time to peak, plasma: 2-3 hours

Excretion: Feces (79%, 20% as unchanged drug); urine (13%, 7% as unchanged drug)

Related Information

- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV

Pharmacotherapy PearlsA listing of medications that should not be used concurrently is available with each bottle and patients should be provided with this information.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression, insomnia, dizziness, and fatigue

Mental Health: Effects on Psychiatric TreatmentContraindicated with midazolam, pimozide, St John's wort, triazolam, and ergot derivatives.

Carbamazepine may decrease serum levels of atazanavir. TCA and sildenafil serum concentrations may be increased by atazanavir; monitor. Nausea, dizziness, hypotension, and syncope have been reported with concomitant use of trazodone and ritonavir.

Index Terms Atazanavir Sulfate; BMS-232632

U.S. Brand NamesTenoretic®

Canadian Brand NamesApo-Atenidone®; Novo-Atenolthalidone; Tenoretic®

Pharmacologic CategoryBeta Blocker, Beta$_1$ Selective; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension with a cardioselective beta-blocker and a diuretic

Dosing: AdultsHypertension: Oral: Initial: 1 (50) tablet once daily, then individualize dose until optimal dose is achieved

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl$_{cr}$ 15-35 mL/minute: Administer 50 mg/day.

Cl$_{cr}$ <15 mL/minute: Administer 50 mg every other day.

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered without regard to meals.

Dietary ConsiderationsMay be taken without regard to meals.

ContraindicationsHypersensitivity to atenolol, chlorthalidone, or any component of the formulation; pregnancy

Allergy Considerations

- Beta-Blocker Allergy
- Thiazide/Thiazide-Related Diuretic Allergy

Pregnancy Risk FactorD

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsSee individual agents.

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Ampicillin: May decrease the bioavailability of Atenolol. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Theophylline Derivatives: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

50: Atenolol 50 mg and chlorthalidone 25 mg

100: Atenolol 100 mg and chlorthalidone 25 mg

Tenoretic®:

50: Atenolol 50 mg and chlorthalidone 25 mg

100: Atenolol 100 mg and chlorthalidone 25 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Atenolol-Chlorthalidone)

50-25 mg (30): $13.99

100-25 mg (90): $31.00

Tablets (Tenoretic 100)

100-25 mg (30): $83.19

Tablets (Tenoretic 50)

50-25 mg (30): $62.39

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Atenolol
- Chlorthalidone

Dental Health: Effects on Dental TreatmentAtenolol is a cardioselective beta-blocker. Local anesthetic with vasoconstrictor can be safely used in patients medicated with atenolol. Nonselective beta-blockers (ie, propranolol, nadolol) enhance the pressor response to epinephrine, resulting in hypertension and bradycardia; this has not been reported for atenolol. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue, insomnia, and confusion which can clinically look like depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with other psychotropics may produce an additive hypotensive response (especially low-potency antipsychotics and TCAs)

Cardiovascular ConsiderationsSee individual components.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Atenolol may be confused with albuterol, Altenol®, timolol, Tylenol®

Tenormin® may be confused with Imuran®, Norpramin®, thiamine, Trovan®

International issues:

Betanol® [Bangladesh] may be confused with Patanol® which is a brand name for olopatadine in the U.S.

Pronunciation(a TEN oh lole)

U.S. Brand NamesTenormin®

Canadian Brand NamesApo-Atenol®; Gen-Atenolol; Novo-Atenol; Nu-Atenol; PMS-Atenolol; RAN™-Atenolol; Rhoxal-atenolol; Riva-Atenolol; Sandoz-Atenolol; Tenolin; Tenormin®

Pharmacologic CategoryBeta Blocker, Beta$_1$ Selective

Use: Labeled IndicationsTreatment of hypertension, alone or in combination with other agents; management of angina pectoris, postmyocardial infarction patients

Use: Unlabeled/InvestigationalAcute ethanol withdrawal, supraventricular and ventricular arrhythmias, and migraine headache prophylaxis

Dosing: Adults

Hypertension:

Oral: 25-50 mg once daily, may increase to 100 mg/day. Doses >100 mg are unlikely to produce any further benefit.

I.V.: Dosages of 1.25-5 mg every 6-12 hours have been used in short-term management of patients unable to take oral enteral beta-blockers

Angina pectoris: Oral: 50 mg once daily; may increase to 100 mg/day. Some patients may require 200 mg/day.

Postmyocardial infarction:

I.V.: Early treatment: 5 mg slow I.V. over 5 minutes; may repeat in 10 minutes. If both doses are tolerated, may start oral atenolol 50 mg every 12 hours or 100 mg/day for 6-9 days postmyocardial infarction.

Oral: Follow I.V. dose with 100 mg/day or 50 mg twice daily for 6-9 days postmyocardial infarction.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Hypertension: Oral: Children: 0.5-1 mg/kg/dose given daily; range of 0.5-1.5 mg/kg/day; maximum dose: 2 mg/kg/day up to 100 mg/day

Dosing: Renal Impairment

Cl_{cr} 15-35 mL/minute: Administer 50 mg/day maximum.

Cl_{cr} <15 mL/minute: Administer 50 mg every other day maximum.

Hemodialysis effects: Moderately dialyzable (20% to 50%) via hemodialysis. Administer dose postdialysis or administer 25-50 mg supplemental dose. Elimination is not enhanced with peritoneal dialysis. Supplemental dose is not necessary.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.When administered acutely for cardiac treatment, monitor ECG and blood pressure. The injection can be administered undiluted or diluted with a compatible I.V. solution. May administer by rapid infusion (I.V. push) at a rate of 1 mg/minute or by slow infusion over ~30 minutes. Necessary monitoring for surgical patients who are unable to take oral beta-blockers (prolonged ileus) has not been defined. Some institutions require monitoring of baseline and postinfusion heart rate and blood pressure when a patient's response to beta-blockade has not been characterized (ie, the patient's initial dose or following a change in dose). Consult individual institutional policies and procedures.

Administration: I.V. DetailpH: 5.5-6.5
Dietary ConsiderationsMay be taken without regard to meals.
StorageProtect from light.
CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Meperidine, meropenem, morphine. **Incompatible:** Amphotericin B cholesteryl sulfate complex.

Extemporaneously PreparedA 2 mg/mL atenolol oral liquid compounded from tablets and a commercially available oral diluent was found to be stable for up to 40 days when stored at 5°C or 25°C.

> Garner SS, Wiest DB, and Reynolds ER, “Stability of Atenolol in an Extemporaneously Compounded Oral Liquid,” *Am J Hosp Pharm*, 1994, 51(4):508-11.

ContraindicationsHypersensitivity to atenolol or any component of the formulation; sinus bradycardia; sinus node dysfunction; heart block greater than first-degree (except in patients with a functioning artificial pacemaker); cardiogenic shock; uncompensated cardiac failure; pulmonary edema; pregnancy
Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Boxed warnings:

- Abrupt withdrawal: See “Other warnings/precautions” below

Concerns related to adverse events:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; however, atenolol, with B_1 selectivity, has been used cautiously with close monitoring.

- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.

- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.

- Heart failure (HF): Use with caution in patients with compensated heart failure and monitor for a worsening of the condition (efficacy of atenolol in HF has not been demonstrated).

- Myasthenia gravis: Use with caution in patients with myasthenia gravis.

- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).

- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.

- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents which decrease myocardial function.

- Calcium channel blockers: Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur. Avoid concurrent I.V. use of both agents.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: **[U.S. Boxed Warning]: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.**

Geriatric ConsiderationsDue to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (ie, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20% to 50% in the elderly. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults. Since many elderly have Cl_{cr} <35 mL/minute, creatinine clearance should be estimated or measured such that appropriate dose adjustment can be made.
Pregnancy Risk FactorD
Pregnancy ConsiderationsAtenolol crosses the placenta; beta-blockers have been associated with persistent bradycardia, hypotension, and IUGR; IUGR is probably related to maternal hypertension. Available evidence suggests beta-blockers are generally safe during pregnancy (JNC 7). Cases of neonatal hypoglycemia have been reported following maternal use of beta-blockers at parturition or during breast-feeding. Monitor breast-fed infant for symptoms of beta-blockade.

LactationEnters breast milk/use caution

Breast-Feeding Considerations Symptoms of beta-blockade including cyanosis, hypothermia, and bradycardia have been reported in nursing infants.

Adverse Reactions

1% to 10%:

Cardiovascular: Persistent bradycardia, hypotension, chest pain, edema, heart failure, second- or third-degree AV block, Raynaud's phenomenon

Central nervous system: Dizziness, fatigue, insomnia, lethargy, confusion, mental impairment, depression, headache, nightmares

Gastrointestinal: Constipation, diarrhea, nausea

Genitourinary: Impotence

Miscellaneous: Cold extremities

<1% (Limited to important or life-threatening): Alopecia, dyspnea (especially with large doses), hallucinations, impotence, liver enzymes increased, lupus syndrome, Peyronie's disease, positive ANA, psoriasiform rash, psychosis, thrombocytopenia, wheezing

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Ampicillin: May decrease the bioavailability of Atenolol. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Theophylline Derivatives: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Atenolol serum concentrations may be decreased if taken with food.

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Test InteractionsIncreased glucose; decreased HDL

Monitoring ParametersAcute cardiac treatment: Monitor ECG and blood pressure with I.V. administration; heart rate and blood pressure with oral administration

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. **I.V.:** Requires cardiac and hemodynamic monitoring and hypotensive precautions. **Oral:** Assess blood pressure and heart rate prior to and following first dose and any change in dosage. Assess therapeutic effectiveness and adverse effects (eg, CHF, edema, new cough, dyspnea, unresolved fatigue). Advise patients with diabetes to monitor glucose levels closely (beta-blockers may alter glucose tolerance). Do not discontinue abruptly; taper dose gradually. Teach patient appropriate use, possible side effects/interventions (hypotension precautions), and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed; with or without regard to meals; do not take with antacids. Do not adjust dosage or discontinue medication without consulting prescriber. Take pulse daily (prior to medication) and follow prescriber's instruction about holding medication. If you have diabetes, monitor serum sugar closely (drug may alter glucose tolerance or mask signs of hypoglycemia). May cause fatigue, dizziness, or postural hypotension (use caution when changing position from lying or sitting to standing, when driving, or climbing stairs until response to medication is known). Alteration in sexual performance (reversible); or constipation (increased dietary bulk and fluids and exercise may help). Report unresolved swelling of extremities, respiratory difficulty or new cough, unresolved fatigue, unusual weight gain, unresolved constipation, or unusual muscle weakness. **Pregnancy/breast-feeding precautions:** Do not get pregnant or cause a pregnancy (males) while using this medication. Consult prescriber for appropriate contraceptive measures. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution:

Tenormin®: 0.5 mg/mL (10 mL) [DSC]

Tablet: 25 mg, 50 mg, 100 mg

Tenormin®: 25 mg, 50 mg, 100 mg

Generic AvailableYes: Tablet

Pricing: U.S. (www.drugstore.com)

Tablets (Atenolol)

25 mg (90): $11.99

50 mg (90): $17.99

100 mg (90): $15.89

Tablets (Tenormin)

25 mg (30): $58.24

50 mg (30): $58.23

100 mg (30): $79.03

Mechanism of ActionCompetitively blocks response to beta-adrenergic stimulation, selectively blocks beta$_1$-receptors with little or no effect on beta$_2$-receptors except at high doses

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Oral: 2-4 hours

Duration: Normal renal function: 12-24 hours

Absorption: Incomplete

Distribution: Low lipophilicity; does not cross blood-brain barrier

Protein binding: 3% to 15%

Metabolism: Limited hepatic

Half-life elimination: Beta:

Neonates: ≤35 hours; Mean: 16 hours

Children: 4.6 hours; children >10 years may have longer half-life (>5 hours) compared to children 5-10 years (<5 hours)

Adults: Normal renal function: 6-9 hours, prolonged with renal impairment; End-stage renal disease: 15-35 hours

Excretion: Feces (50%); urine (40% as unchanged drug)

Related Information

- Beta-Blockers

Dental Health: Effects on Dental TreatmentAtenolol is a cardioselective beta-blocker. Local anesthetic with vasoconstrictor can be safely used in patients medicated with atenolol. Nonselective beta-blockers (ie, propranolol, nadolol) enhance the pressor response to epinephrine, resulting in hypertension and bradycardia; this has not been reported for atenolol. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue, insomnia, and confusion which can clinically look like depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with other psychotropics may produce an additive hypotensive response (especially low-potency antipsychotics and TCAs)

Cardiovascular Considerations

Atrial Fibrillation: Beta-blocker therapy provides effective rate control in patients with atrial fibrillation.

Chronic Stable Angina: Beta-blockers are effective in the treatment of chronic stable angina as monotherapy or when combined with nitrates and/or calcium channel blockers. In patients with severe intractable angina requiring negative cardiac chronotropic medications, pacemaker placement has been carried out to maintain heart rate in the setting of large doses of beta-blockers and/or calcium channel blockers. Beta-blockers are ineffective in the treatment of pure vasospastic (Prinzmetal) angina.

Hypertension: Beta-blocker therapy in the treatment of hypertension has been associated with improved cardiovascular outcomes. According to the 2003 JNC-VII guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Beta-blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for a beta-blocker include patients with heart failure, postmyocardial infarction, high coronary disease risk, or diabetes. In type 2 diabetic patients, a UK Prospective Diabetes Study Group (UKPDS) trial showed that beta-blocker therapy (atenolol) was as effective as an ACE inhibitor in reducing cardiovascular events and that the benefits of therapy were related more to the degree of antihypertensive efficacy rather than the class of drug used.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

ST-Segment Elevation Myocardial Infarction (STEMI): Beta-blockers, without intrinsic sympathomimetic activity (ISA), have been shown to decrease morbidity and mortality when initiated in the acute treatment of STEMI and continued long-term. Oral beta-blockade should be initiated promptly in patients without contraindications (eg, signs of heart failure, evidence of a low output state, risk of cardiogenic shock, or other beta-blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade may be considered and given promptly if the patient is experiencing concomitant hypertension or a tachyarrhythmia (Class IIa recommendation).

Unstable Angina/Non-ST-Segment Elevation MI (UA/NSTEMI): In the treatment of UA/NSTEMI, oral beta-blockade should be initiated within the first 24 hours in patients without contraindications (eg, signs of heart failure, evidence of a low output state, risk of cardiogenic shock, or other beta-blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade should only be considered if the patient is experiencing concomitant hypertension upon presentation (Class IIa recommendation).

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered to avoid acute tachycardia and hypertension.

Anesthesia and Critical Care Concerns/Other Considerations**Surgery:** Based on available evidence, beta-blockers should be started days to weeks before elective surgery in selected patients when possible and titrated to a heart rate <65 beats per minute. Additional data suggest that long acting beta-blockers may be superior to short acting ones (Redelmeier, 2005). The ACC/AHA 2007 guidelines on perioperative cardiovascular evaluation and care for noncardiac surgery recommend beta-blockers be continued in patients undergoing surgery who are receiving beta-blockers to treat angina, symptomatic arrhythmias, hypertension, or other ACC/AHA Class I guideline indications (Class I recommendation). The guidelines also recommend that beta-blockers be given to patients undergoing vascular surgery who have myocardial ischemia demonstrated during preoperative testing (Class I recommendation).

The guidelines also state that beta-blockers are probably recommended in patients undergoing intermediate risk (eg, carotid endarterectomy, prostate surgery) or vascular surgery in whom preoperative assessment identifies coronary heart disease or high cardiac risk (Class IIa recommendation). High cardiac risk is defined as having >1 of the following clinical risk factors: History of ischemic heart disease, compensated or prior heart failure, cerebrovascular disease, diabetes mellitus, or renal insufficiency. The use of beta-blockers is uncertain in patients undergoing intermediate risk or vascular surgery with ≤1 clinical risk factor (Class IIb recommendation).

The majority of published trials suggest a benefit of perioperative beta-blocker use during noncardiac surgery especially in high-risk patients; however, more recent clinical trials have not shown a benefit to perioperative beta-blockade for noncardiac surgery (Juul, 2006; Yang, 2006).

Medications for ADHD: AHA Clarification of Cardiovascular Screening Recommendation - May 2008

In an effort to reduce the rate of sudden cardiac death especially in pediatric patients receiving stimulant medications for the treatment of attention-deficit/hyperactivity disorder (ADHD), the American Heart Association (AHA) issued a statement in April 2008 recommending that all children diagnosed with ADHD who may be candidates for stimulant medications have a thorough cardiovascular assessment prior to initiation of drug therapy. The AHA scientific statement was issued by the Council on Cardiovascular Disease in the Young Congenital Cardiac Defects Committee and the Council on Cardiovascular Nursing. On May 16, 2008, the AHA issued a clarification of the statement due to the language regarding ECG recommendations and subsequent interpretations.

These recommendations are based on the Food and Drug Administration (FDA) reports of serious cardiovascular adverse events (including sudden death) in patients (both children and adults) taking usual doses of stimulant medications. Most of these patients were found to have underlying structural heart disease (eg, hypertrophic obstructive cardiomyopathy). In 2006, these reports prompted the FDA to recommend labeling changes of these medications to include warnings about cardiovascular events and to develop patient medication guides to be distributed with each prescription.

Stimulant medications theoretically increase cardiovascular risk due to potential effects on blood pressure elevation and increased heart rate. These effects have generally been considered clinically insignificant in most children, however, may be detrimental in certain patients with underlying cardiovascular disease. None of the medications have been shown to cause heart conditions or proven to have caused sudden cardiac death.

The committee suggests that patients needing the following ADHD medications receive a thorough cardiovascular assessment: Methylphenidate, amphetamine, dextroamphetamine, atomoxetine, clonidine, guanfacine, desipramine, imipramine, bupropion, and modafinil.

According to the clarified AHA recommendations, this assessment should include a combination of thorough medical history, family history, and physical examination with the intent to identify risk factors for sudden death. Although not mandatory, physicians should consider obtaining an ECG.

Patients already maintained on ADHD medications should not stop taking their medication. Instead, patients or their caregivers should contact their healthcare provider. It is reasonable that these patients undergo a similar cardiovascular assessment without interruption of therapy.

Press releases and clarified recommendations from the AHA note that the intent of this statement is not to reduce appropriate use of these medications, but to provide physicians with useful tools to identify heart conditions in children with ADHD in order to make more informed prescribing decisions. ECG testing is recommended as one option to be used as part of a combination screening process. They do suggest that a lack of ECG testing should not necessarily mean that treatment not be initiated.

The clarified statement has been endorsed by the American Academy of Child and Adolescent Psychiatry, the American College of Cardiology, Children and Adults with Attention-Deficit/Hyperactivity Disorder, and the National Initiative for Children’s Healthcare Quality.

Pronunciation(AT oh mox e teen)
U.S. Brand NamesStrattera®
Canadian Brand NamesStrattera®
Pharmacologic CategoryNorepinephrine Reuptake Inhibitor, Selective
Use: Labeled IndicationsTreatment of attention deficit/hyperactivity disorder (ADHD)
Dosing: Adults

Treatment of ADHD: Oral: Initial: 40 mg/day, increased after minimum of 3 days to ~80 mg/day; may administer as either a single daily dose or 2 evenly divided doses in morning and late afternoon/early evening. May increase to 100 mg/day in 2-4 additional weeks to achieve optimal response.

Dosage adjustment in patients receiving strong CYP2D6 inhibitors (eg, paroxetine, fluoxetine, quinidine) or patients known to be CYP2D6 poor metabolizers: Do not exceed 80 mg/day; dose adjustments should occur only after 4 weeks.

Note: Atomoxetine may be discontinued without the need for tapering dose.

Dosing: ElderlyUse has not been evaluated in the elderly.
Dosing: Pediatric**Treatment of ADHD:**

Children ≥6 years and ≤70 kg: Oral: Initial: 0.5 mg/kg/day, increase after minimum of 3 days to ~1.2 mg/kg/day; may administer as either a single daily dose or 2 evenly divided doses in morning and late afternoon/early evening. Maximum daily dose: 1.4 mg/kg or 100 mg, whichever is less.

Dosage adjustment in patients receiving strong CYP2D6 inhibitors (eg, paroxetine, fluoxetine, quinidine) or patients known to be CYP2D6 poor metabolizers: Do not exceed 1.2 mg/kg/day; dose adjustments should occur only after 4 weeks.

Children ≥6 years and >70 kg: Refer to adult dosing.

Note: Atomoxetine may be discontinued without the need for tapering dose.

Dosing: Renal ImpairmentNo adjustment needed.
Dosing: Hepatic Impairment

Moderate hepatic insufficiency (Child-Pugh class B): All doses should be reduced to 50% of normal.

Severe hepatic insufficiency (Child-Pugh class C): All doses should be reduced to 25% of normal.

Administration: OralMay be administered with or without food. Swallow capsules whole; do not open capsules. Powder in capsules is an ocular irritant.
Dietary ConsiderationsMay be taken with or without food.
StorageStore at room temperature of 25°C (77°F).
RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) for this medication. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to all patients or parents or guardians of children and teenagers receiving this medication.
ContraindicationsHypersensitivity to atomoxetine or any component of the formulation; use with or within 14 days of MAO inhibitors; narrow-angle glaucoma
Allergy Considerations

- Atomoxetine Allergy

Warnings/Precautions

Boxed warnings:

- Pediatrics: See “Special populations” below.

Concerns related to adverse effects:

- Aggressive behavior: New or worsening symptoms of hostility or aggressive behaviors have been associated with atomoxetine, particularly with the initiation of therapy.

- Allergic reactions: Angioneurotic edema, urticaria, and rash may occur (rare).

- Cardiovascular events: CNS stimulant use has been associated with serious cardiovascular events including sudden death in patients with pre-existing structural cardiac abnormalities or other serious heart problems (sudden death in children and adolescents; sudden death, stroke, and MI in adults). These products should be avoided in patients with known serious structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, or other serious cardiac problems that could increase the risk of sudden death that these conditions alone carry. Patients should be carefully evaluated for cardiac disease prior to initiation of therapy.

- Hepatotoxicity: Use may be associated with rare but severe hepatotoxicity; discontinue and do not restart if signs or symptoms of hepatotoxic reaction (eg, jaundice, pruritus, flu-like symptoms) are noted. Use with caution in patients with hepatic impairment; dosage adjustments may be necessary. Use with caution in patients who are poor metabolizers of CYP2D6 metabolized drugs ("poor metabolizers"); bioavailability increases.

- Priapism: Priapism has been associated with use (rarely).

Disease-related concerns:

- ADHD and comorbidities: Randomized, controlled trials have demonstrated that atomoxetine does not worsen anxiety in patients with existing anxiety disorders or tics related to Tourette's disorder.

- Hypertension: Use with caution in patients with hypertension and other cardiovascular conditions that might be exacerbated by increases in blood pressure or heart rate.

- Psychiatric disorders: Use caution in patients with a history of psychotic illness or bipolar disorder; therapy may induce mixed/manic disorder or psychotic symptoms. Atomoxetine is not approved for major depressive disorder; patients presenting with depressive symptoms should be screened for bipolar disorder.

- Urinary retention: Use with caution in patients with a history of urinary retention or bladder outlet obstruction; may cause urinary retention/hesitancy.

Special populations:

- Pediatrics: **[U.S. Boxed Warning]: Use with caution in pediatric patients; may be an increased risk of suicidal ideation.** Closely monitor for clinical worsening, suicidality, or unusual changes in behavior; especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. The family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. Growth should be monitored during treatment. Height and weight gain may be reduced during the first 9-12 months of treatment, but should recover by 3 years of therapy. Safety and efficacy have not been evaluated in pediatric patients <6 years of age.

Other warnings/precautions:

- ADHD treatment: Appropriate use: Recommended to be used as part of a comprehensive treatment program for attention deficit disorders.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDecreased pup weight and survival were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use only if potential benefit to the mother outweighs possible risk to fetus.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsPercentages as reported in children and adults; some adverse reactions may be increased in "poor metabolizers" (CYP2D6).

>10%:

Central nervous system: Headache (2% to 19%), insomnia (2% to 15%), somnolence (4% to 11%)

Gastrointestinal: Xerostomia (21%), nausea (7% to 21%), abdominal pain (7% to 18%), appetite decreased (11% to 16%), vomiting (3% to 11%)

1% to 10%:

Cardiovascular: Systolic blood pressure increased (4% to 5%), diastolic pressure increased (≤4%), palpitation (3%), flushing (≥2%), tachycardia (≤2%), orthostatic hypotension (<2%)

Central nervous system: Fatigue/lethargy (6% to 9%), dizziness (5% to 6%), irritability (≤6%), chills (3%), sleep disturbance (3%), mood swings (1% to 2%)

Dermatologic: Hyperhidrosis (4%), rash (2%)

Endocrine & metabolic: Hot flashes (8%), dysmenorrhea (6%), libido decreased (4%), menstruation disturbance (2%), orgasm abnormal (2%)

Gastrointestinal: Constipation (1% to 9%), dyspepsia (4%), anorexia (<3%), weight loss (2% to 3%)

Genitourinary: Erectile disturbance (9%), urinary hesitation/retention (7%), dysuria (3%), ejaculatory disturbance (3%), prostatitis (2%)

Neuromuscular & skeletal: Tremor (2%)

Ocular: Mydriasis (≥2%)

Respiratory: Sinus headache (3%)

Miscellaneous: Jittery feeling (2%)

Postmarketing and/or case reports: Allergic reactions, aggressiveness, agitation, akathisia, allergy, angioedema, anxiety, delusional thinking, growth suppression (children), hallucinations, hepatotoxicity, hostility, hypomania, impulsiveness, jaundice, mania, MI, panic attacks, pelvic pain, peripheral vascular instability, priapism, pruritus, QT prolongation, Raynaud's phenomenon, seizure (including patients with no prior history or known risk factors for seizure), stroke, suicidal ideation, syncope, urticaria

Metabolism/Transport Effects**Substrate** of CYP2C19 (minor), 2D6 (major)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Beta2-Agonists: Atomoxetine may enhance the tachycardic effect of Beta2-Agonists. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Antidepressants (Selective Norepinephrine Reuptake Inhibitor) may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the neurotoxic (central) effect of Atomoxetine. *Risk X: Avoid combination*

PARoxetine: May decrease the metabolism of Atomoxetine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersPatient growth (weight/height gain in children); attention, hyperactivity, anxiety, worsening of aggressive behavior or hostility; blood pressure and pulse (baseline and following dose increases and periodically during treatment)

Family members and caregivers need to monitor patient daily for emergence of irritability, agitation, unusual changes in behavior, and suicidal ideation. Pediatric patients should be monitored closely for suicidality, clinical worsening, or unusual changes in behavior, especially during the initial for months of therapy or at times of dose changes. Appearance of symptoms needs to be immediately reported to healthcare provider. Weekly office visits from patient or caregiver are necessary for the first 4 weeks, then every other week for the next 4 weeks, then at 12 weeks, and as clinically indicated beyond 12 weeks. Additional contact may be required between office visits.

When used for the treatment of ADHD, thoroughly evaluate for cardiovascular risk. Monitor heart rate, blood pressure, and consider obtaining ECG prior to initiation (Vetter, 2008)

Nursing: Physical Assessment/MonitoringEvaluate need for cautious use (eg, presence of hepatic impairment, renal impairment, hypertension, cardiovascular disease, history of urinary retention, bladder outlet obstruction, psychotic illness, or bipolar disorder). Assess other pharmacological agents or biologicals that patient may be taking for potential interactions (dose adjustments may be necessary). Assess therapeutic effectiveness and adverse response at regular intervals during therapy. Pediatric patients should be screened/monitored for cardiovascular conditions prior to and during use; observed closely during first few months of therapy and when dose is increased or decreased (may be at increased risk of suicidal ideation); growth (height and weight) should also be monitored regularly. Teach patient/caregiver proper use, possible side effects/appropriate interventions, and adverse symptoms to report. Instruct patient/caregiver to read the medication guide that is dispensed with each prescription.

Patient EducationDo not take any new prescription or over-the-counter medications, or herbal products during therapy without consulting prescriber. Take exactly as directed at the same time of day, without regard for meals. Do not discontinue or alter dose without consulting prescriber. Avoid alcohol (may increase CNS depression). You may experience CNS changes; fatigue/lethargy, irritability, sleep disturbances (use caution when driving or engaged in potentially hazardous tasks until response to drug is known); nausea, vomiting, or decreased appetite (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea or constipation (if persistent consult prescriber); menstrual disturbances, abnormal orgasm, erectile or ejaculatory disturbance, impotence; muscle, bone, or joint pain. Report immediately any chest pain, palpitations, rapid heartbeat; suicidal ideation; or persistent CNS changes (especially any increase in aggression or hostility). Inform prescriber of persistent gastrointestinal effects (pain, vomiting, decreased appetite); muscle or skeletal pain or weakness; dark urine, jaundice, right upper-quadrant pain, unexplained flu-like symptoms, or other persistent adverse effects.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Strattera®: 10 mg, 18 mg, 25 mg, 40 mg, 60 mg, 80 mg, 100 mg

Generic AvailableNo

ManufacturerEli Lilly and Company

Pricing: U.S. (www.drugstore.com)

Capsules (Strattera)

10 mg (30): $141.69

18 mg (30): $150.94

25 mg (30): $142.08

40 mg (30): $149.48

60 mg (30): $149.48

80 mg (30): $163.24

100 mg (30): $165.37

Mechanism of ActionSelectively inhibits the reuptake of norepinephrine (Ki 4.5nM) with little to no activity at the other neuronal reuptake pumps or receptor sites.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: V_d: I.V.: 0.85 L/kg

Protein binding: 98%, primarily albumin

Metabolism: Hepatic, via CYP2D6 and CYP2C19; forms metabolites (4-hydroxyatomoxetine, active, equipotent to atomoxetine; N-desmethylatomoxetine in poor metabolizers, limited activity)

Bioavailability: 63% in extensive metabolizers; 94% in poor metabolizers

Half-life elimination: Atomoxetine: 5 hours (up to 24 hours in poor metabolizers); Active metabolites: 4-hydroxyatomoxetine: 6-8 hours; N-desmethylatomoxetine: 6-8 hours (34-40 hours in poor metabolizers)

Time to peak, plasma: 1-2 hours

Excretion: Urine (80%, as conjugated 4-hydroxy metabolite); feces (17%)

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Use vasoconstrictor with caution. Atomoxetine may increase heart rate or blood pressure in the presence of pressor agents. Pressor agents include the vasoconstrictors epinephrine and levonordefrin (Neo-Cobefrin®)

Index Terms Atomoxetine Hydrochloride; LY139603; Methylphenoxy-Benzene Propanamine; Tomoxetine

HMG-CoA Reductase Inhibitors: Evidence Does Not Suggest Increased Incidence of Amyotrophic Lateral Sclerosis (ALS) - Results of FDA Analysis - September 30, 2008

The U.S. Food and Drug Administration's (FDA) review of 41 long-term controlled clinical trials of HMG-CoA reductase inhibitors finds no evidence of an increased incidence of ALS (also known as Lou Gehrig's disease) related to these medications. This analysis occurred after the FDA had received notice of numerous adverse events of which 109 of these reports mentioned ALS, Lou Gehrig's disease, or motor neurone disease. The clinical trials included in the analysis had a median duration of treatment of 3.3 years (range of duration: 6 months to 5 years) and involved 120,964 patients. The analysis identified a total of 19 cases of ALS – 9 cases per 64,602 patients (0.014%) with statin therapy and 10 cases per 56,362 patients (0.017%) with placebo. The incidence rates, based on approximately 400,000 person-years, were 4.2 per 100,000 person-years in the statin-treated group and 5 per 100,000 person-years in the placebo-treated group.

The FDA recommends that health care providers continue to prescribe, and patients continue to use these products as described within their labeling.

For more information, healthcare professionals may refer to the following:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Statin

Medication Safety Issues

Sound-alike/look-alike issues:

Lipitor® may be confused with Levatol®

Pronunciation(a TORE va sta tin)

U.S. Brand NamesLipitor®

Canadian Brand NamesLipitor®

Pharmacologic CategoryAntilipemic Agent, HMG-CoA Reductase Inhibitor

Use: Labeled IndicationsTreatment of dyslipidemias or primary prevention of cardiovascular disease (atherosclerotic) as detailed below:

Primary prevention of cardiovascular disease (high-risk for CVD): To reduce the risk of MI or stroke in patients without evidence of heart disease who have multiple CVD risk factors or type 2 diabetes. Treatment reduces the risk for angina or revascularization procedures in patients with multiple risk factors.

Secondary prevention of cardiovascular disease: To reduce the risk of MI, stroke, revascularization procedures, and angina in patients with evidence of heart disease. To reduce the risk of hospitalization for heart failure.

Treatment of dyslipidemias: To reduce elevations in total cholesterol, LDL-C, apolipoprotein B, and triglycerides in patients with elevations of one or more components, and/or to increase HDL-C as present in Fredrickson type IIa, IIb, III, and IV hyperlipidemias; treatment of primary dysbetalipoproteinemia, homozygous familial hypercholesterolemia

Treatment of heterozygous familial hypercholesterolemia (HeFH) in adolescent patients (10-17 years of age, females >1 year postmenarche) having LDL-C ≥190 mg/dL or LDL-C ≥160 mg/dL with positive family history of premature cardiovascular disease (CVD) or with two or more CVD risk factors.

Dosing: Adults

Hypercholesterolemia (heterozygous familial and nonfamilial) and mixed hyperlipidemia (Fredrickson types IIa and IIb): Oral: Initial: 10-20 mg once daily; patients requiring >45% reduction in LDL-C may be started at 40 mg once daily; range: 10-80 mg once daily

Homozygous familial hypercholesterolemia: Oral: 10-80 mg once daily

Note: Doses should be individualized according to the baseline LDL-cholesterol levels, the recommended goal of therapy, and patient response; adjustments should be made at intervals of 2-4 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

HeFH: Children 10-17 years (females >1 year postmenarche): Oral: 10 mg once daily (maximum: 20 mg/day)

Note: Doses should be individualized according to the baseline LDL-cholesterol levels, the recommended goal of therapy, and patient response; adjustments should be made at intervals of 2-4 weeks

Dosing: Renal ImpairmentNo adjustment is necessary.
Dosing: Hepatic ImpairmentDecrease dosage with severe disease (eg, chronic alcoholic liver disease).
Administration: OralMay be administered with food if desired; may take without regard to time of day.
Dietary ConsiderationsMay take with food if desired; may take without regard to time of day. Before initiation of therapy, patients should be placed on a standard cholesterol-lowering diet for 3-6 months and the diet should be continued during drug therapy. Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.
ContraindicationsHypersensitivity to atorvastatin or any component of the formulation; active liver disease; unexplained persistent elevations of serum transaminases; pregnancy
Allergy Considerations

- HMG-CoA Reductase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Myopathy/rhabdomyolysis: Patients receiving HMG-CoA reductase inhibitors have developed rhabdomyolysis with acute renal failure and/or myopathy; patients should be monitored closely. This risk is dose-related and is increased with concurrent use of CYP3A4 inhibitors (eg, CSA, clarithromycin, protease inhibitors), fibric acid derivatives (eg, gemfibrozil), or niacin (doses ≥1 g/day) (see Drug Interactions). If concurrent use of clarithromycin or combination protease inhibitors (eg, lopinavir/ritonavir or ritonavir/saquinavir) is warranted consider dose adjustment of atorvastatin. Ensure patient is on the lowest effective atorvastatin dose in all circumstances. Temporarily discontinue for elective major surgery, acute medical or surgical conditions, or in any patient experiencing an acute or serious condition predisposing to renal failure (eg, sepsis, hypotension, trauma, uncontrolled seizures). Based upon current evidence, HMG-CoA reductase inhibitor therapy should be continued in the perioperative period unless risk outweighs cardioprotective benefit. Use caution in patients with renal impairment, inadequately treated hypothyroidism, and those taking other drugs associated with myopathy (eg, colchicine); these patients are predisposed to myopathy. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine.

Disease-related concerns:

- Hemorrhagic stroke: Patients with a history of hemorrhagic stroke may be at increased risk for another with use.

- Hepatic impairment and/or ethanol use: Use with caution in patients who consume large amounts of ethanol or have a history of liver disease.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors (see Drug Interactions); consider alternative agents that avoid or lessen potential for CYP-mediated interactions.

Special populations:

- Elderly: Use with caution in patients with advanced age, these patients are predisposed to myopathy.

- Pediatrics: Safety and efficacy have not been established in patients <10 years or in premenarcheal girls.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

Geriatric ConsiderationsEffective and well tolerated in elderly. The definition of and, therefore, when to treat hyperlipidemia in the elderly is a controversial issue. The National Cholesterol Education Program recommends that all adults maintain a plasma cholesterol <160 mg/dL. Elderly patients with one additional risk factor, goal LDL would be <130 mg/dL. It is the authors' belief that pharmacologic treatment be reserved for those who are unable to obtain a desirable plasma cholesterol concentration by diet alone and for whom the benefits of treatment are believed to outweigh the potential adverse effects, drug interactions, and cost of treatment.
Pregnancy Risk FactorX
Pregnancy ConsiderationsCholesterol biosynthesis may be important in fetal development. Contraindicated in pregnancy. Administer to women of childbearing potential only when conception is highly unlikely and patients have been informed of potential hazards.
LactationEnters breast milk/contraindicated
Adverse Reactions

>10%: Central nervous system: Headache (3% to 17%)

2% to 10%:

Cardiovascular: Chest pain, peripheral edema

Central nervous system: Insomnia, dizziness

Dermatologic: Rash (1% to 4%)

Gastrointestinal: Abdominal pain (up to 4%), constipation (up to 3%), diarrhea (up to 4%), dyspepsia (1% to 3%), flatulence (1% to 3%), nausea

Genitourinary: Urinary tract infection

Hepatic: Transaminases increased (2% to 3% with 80 mg/day dosing)

Neuromuscular & skeletal: Arthralgia (up to 5%), arthritis, back pain (up to 4%), myalgia (up to 6%), weakness (up to 4%)

Respiratory: Sinusitis (up to 6%), pharyngitis (up to 3%), bronchitis, rhinitis

Miscellaneous: Infection (3% to 10%), flu-like syndrome (up to 3%), allergic reaction (up to 3%)

<2% (Limited to important or life-threatening): Abnormal dreams, acne, alopecia, amblyopia, anemia, angina, anorexia, appetite increased, arrhythmia, biliary pain, bursitis, cheilitis, cholestatic jaundice, colitis, cystitis, deafness, depression, dry skin, dry eyes, duodenal ulcer, dysphagia, dyspnea, dysuria, ecchymosis, eczema, edema, emotional lability, enteritis, epididymitis, epistaxis, eructation, esophagitis, eye hemorrhage, facial edema, facial paralysis, fever, fibrocystic breast disease, gastritis, gastroenteritis, gingival hemorrhage, glaucoma, glossitis, gout, hematuria, hepatitis, hyper-/hypoglycemia, hyperkinesia, hypertension, hypertonia, hypoesthesia, impotence, incoordination, kidney calculus, leg cramps, libido decreased, lymphadenopathy, malaise, melena, metrorrhagia, migraine, mouth ulcer, myasthenia, myopathy, myositis, neck rigidity, nephritis, nocturia, palpitation, pancreatitis, paresthesia, parosmia, peripheral neuropathy, petechiae, pharyngitis, phlebitis, photosensitivity, pneumonia, postural hypotension, pruritus, rectal hemorrhage, seborrhea, skin ulcer, somnolence, stomatitis, syncope, taste loss, taste perversion, tendinous contracture, tenesmus, thrombocytopenia, tinnitus, torticollis, urticaria, vaginal hemorrhage, vasodilation, vomiting, weight gain, xerostomia

Postmarketing reports: Anaphylaxis, angioneurotic edema, bullous rash, erythema multiforme, fatigue, rhabdomyolysis, Stevens-Johnson syndrome, tendon rupture, toxic epidermal necrolysis

Additional class-related events or case reports (not necessarily reported with atorvastatin therapy): Alkaline phosphatase increased, cataracts, cirrhosis, CPK increased (>10x normal), dermatomyositis, eosinophilia, erectile dysfunction, extraocular muscle movement impaired, fulminant hepatic necrosis, gynecomastia, hemolytic anemia, memory loss, ophthalmoplegia, peripheral nerve palsy, polymyalgia rheumatica, positive ANA, renal failure (secondary to rhabdomyolysis), systemic lupus erythematosus-like syndrome, thyroid dysfunction, tremor, vasculitis, vertigo

Metabolism/Transport Effects **Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (weak)

Drug Interactions

Aliskiren: Atorvastatin may increase the serum concentration of Aliskiren. *Risk C: Monitor therapy*

Amiodarone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. Management: Dose of HMG-CoA reductase inhibitor may need to be reduced (e.g., simvastatin prescribing information recommends not exceeding 20 mg/day during concurrent therapy). *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Bosentan: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Clopidogrel: Atorvastatin may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Colchicine: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Colchicine may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CycloSPORINE: May increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: Atorvastatin may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Danazol: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

DAPTOmycin: HMG-CoA Reductase Inhibitors may enhance the adverse/toxic effect of DAPTOmycin. Specifically, the risk of skeletal muscle toxicity may be increased. Management: Consider temporarily stopping HMG-CoA reductase inhibitor therapy prior to daptomycin. If used together, regular (i.e., at least weekly) monitoring of CPK concentrations is recommended. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Digoxin: Atorvastatin may increase the serum concentration of Digoxin. *Risk C: Monitor therapy*

Etravirine: May decrease the serum concentration of HMG-CoA Reductase Inhibitors. This applies to atorvastatin, lovastatin and simvastatin. Conversely, levels of fluvastatin may be increased. Management: Dose adjustment of the HMG-CoA reductase inhibitor may be warranted. No interaction is expected with rosuvastatin or pravastatin. *Risk C: Monitor therapy*

Fenofibrate: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Gemfibrozil: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Gemfibrozil may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Grapefruit Juice: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Macrolide Antibiotics: May decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Midazolam: Atorvastatin may increase the serum concentration of Midazolam. *Risk C: Monitor therapy*

Nefazodone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Niacin: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Niacinamide: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Protease Inhibitors: May increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Sildenafil: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

St Johns Wort: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid excessive ethanol consumption (due to potential hepatic effects).

Food: Atorvastatin serum concentrations may be increased by grapefruit juice; avoid concurrent intake of large quantities (>1 quart/day). Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.

Herb/Nutraceutical: St John's wort may decrease atorvastatin levels.

Monitoring ParametersLipid levels after 2-4 weeks; LFTs, CPK

It is recommended that liver function tests (LFTs) be performed prior to and at 12 weeks following both the initiation of therapy and any elevation in dose, and periodically (eg, semiannually) thereafter.

Nursing: Physical Assessment/MonitoringEvaluate patient prior to use for history/existence of liver disease, large alcohol intake, or previous hemorrhagic stroke. Assess risk potential for interactions with other prescriptions or herbal products patient may be taking (especially those that may increase risk of rhabdomyolysis). Assess results of laboratory tests prior to initiation and at regular intervals (eg, liver function tests, lipid levels, CPK). Assess for therapeutic response (decreased lipid levels) and adverse effects at regular intervals during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Instruct patients of childbearing age about appropriate contraceptive measures.

Monitoring: Lab TestsMonitor lipid levels after 2-4 weeks; LFTs prior to initiation and 12 weeks after initiation or first dose or dose elevation, and periodically (semiannually) thereafter; CPK

Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. May take without regard to food (avoid large intake of grapefruit juice). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will need periodic laboratory evaluation during therapy. This drug does not eliminate the need for diet or exercise regimen as recommended by prescriber. May cause headache (consult prescriber for approved analgesic); insomnia or dizziness (use caution when driving or engaging in tasks that require alertness until response to medication is known); diarrhea (buttermilk, boiled milk, or yogurt may help), or constipation (increased dietary fluid and fiber may help). Report chest pain or unusual swelling of extremities; unresolved diarrhea or constipation; itching or burning on urination; unusual muscle cramping or weakness; yellowing of skin or eyes; easy bruising or bleeding, or unusual fatigue. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during therapy. Consult prescriber for instructions on appropriate contraceptive measures. This drug can cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Lipitor®: 10 mg, 20 mg, 40 mg, 80 mg

Generic AvailableNo

ManufacturerPfizer
Pricing: U.S. (www.drugstore.com)

Tablets (Lipitor)

10 mg (30): $85.99

20 mg (30): $119.99

40 mg (30): $119.99

80 mg (30): $119.99

Mechanism of ActionInhibitor of 3-hydroxy-3-methylglutaryl coenzyme A (HMG-CoA) reductase, the rate-limiting enzyme in cholesterol synthesis (reduces the production of mevalonic acid from HMG-CoA); this then results in a compensatory increase in the expression of LDL receptors on hepatocyte membranes and a stimulation of LDL catabolism
Pharmacodynamics/Kinetics

Onset of action: Initial changes: 3-5 days; Maximal reduction in plasma cholesterol and triglycerides: 2 weeks

Absorption: Rapid

Distribution: V_d: 318 L

Protein binding: ≥98%

Metabolism: Hepatic; forms active ortho- and parahydroxylated derivates and an inactive beta-oxidation product

Bioavailability: ~14% (parent drug); ~30% (parent drug and equipotent metabolites)

Half-life elimination: Parent drug: 14 hours; Equipotent metabolites: 20-30 hours

Time to peak, serum: 1-2 hours

Excretion: Bile; urine (2% as unchanged drug)

Mental Health: Effects on Psychiatric TreatmentNone reported
Cardiovascular ConsiderationsHMG-CoA reductase inhibitors are effective in primary and secondary prevention of cardiovascular events in patients with hyperlipidemia. For primary prevention, a patient's major risk factors (cigarette smoking, hypertension or currently taking antihypertensives, low HDL-C, family history, age, gender) should be evaluated. Patients with multiple risk factors (≥2) require more intensive therapy guided by the calculation of a 10-year absolute CHD risk (eg, the percent probability of having a CHD event in next 10 years). An individual's 10-year absolute CHD risk can be calculated at www.med-decisions.com/cvtool/phys/phys.html. LDL cholesterol goals, therapeutic lifestyle changes, and drug therapy are determined based upon a patient's risk factor profile.

Primary prevention trials show that cholesterol-lowering drugs reduce the risk of major coronary events, coronary death, and cerebrovascular events even in the first 6-12 months of use. The WOSCOP trial suggested a trend towards enhanced survival using pravastatin in their patients (mean LDL-cholesterol of 192 mg/dL and no history of MI). In a recent trial (Sever PS, 2003), patients with HTN and at least three other risk factors were randomized to 10 mg daily of atorvastatin or placebo. These patients had a total nonfasting cholesterol <250 mg/dL before treatment. LDL-C levels were 132 mg/dL before treatment and fell to an average of 90 mg/dL in the atorvastatin-treated group. There was a significant reduction in stroke, cardiovascular events, and coronary events in the atorvastatin-treated group as compared to the placebo group. There was no difference in mortality between the groups.

Secondary prevention trials indicate that “statin” therapy reduces mortality, major coronary events, coronary artery procedures, and stroke. The Heart Protection Study proved that lowering serum cholesterol levels reduces the rate of major vascular events among high-risk individuals with documented vascular disease (CHD, cerebrovascular, peripheral vascular) or diabetes regardless of initial cholesterol concentrations. PROVE IT is a randomized, double-blind trial evaluating hospitalized patients with acute coronary syndrome to determine the effects of intense LDL-C lowering therapy. Four thousand patients with an LDL-C levels of 106 mg/dL were randomized to pravastatin 40 mg daily or atorvastatin 80 mg daily. After 2 years, the combined cardiovascular endpoint (death, MI, unstable angina requiring hospitalization, revascularization and stroke) was ~26% in the pravastatin patients (median LDL-C 95 mg/dL) and ~22% in the atorvastatin treated patients (median LDL-C 62 mg/dL).

LaRosa and colleagues assessed the efficacy and safety of lowering LDL cholesterol <100 mg/dL in patients with stable coronary heart disease (LaRosa JC, 2005). Ten thousand and one patients with baseline LDL levels <130 mg/dL were randomized to atorvastatin 10 mg or 80 mg daily and followed for a median of 4.9 years. The primary endpoint was the occurrence of the first major cardiovascular event (death from CVD, MI, resuscitation after cardiac arrest, or stroke). A primary event occurred in 434 patients (8.7%) receiving 80 mg daily (mean LDL 77 mg/dL) and 548 patients (10.9%) receiving 10 mg dose (mean LDL 101 mg/dL) (95% CI, 0.69-0.89; p <0.001). There was no mortality difference between the two treatment groups.

HMG-CoA reductase inhibitors decrease levels of high-sensitivity C-reactive protein (hs-CRP). They also possess pleiotropic properties including improved endothelial function, reduced inflammation at the site of the coronary plaque, inhibition of platelet aggregation, and anticoagulant effects. These nonlipid effects may be beneficial when HMG-CoA reductase inhibitors are introduced early in the management of acute coronary syndromes (de Denus S, 2002).

Myopathy: Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years of age), women more frequently than men, small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, drug interactions (use with caution or avoid). The combination of a HMG-CoA reductase inhibitor plus nicotinic acid seems to carry a lower risk of myopathy than does a HMG-CoA reductase inhibitor plus a fibrate. Other medications, when used concurrently, may enhance the risk of myopathy associated with statins; these include drugs that inhibit CYP3A4 isoenzymes (lovastatin, simvastatin, atorvastatin) or CYP2C9 isoenzymes (fluvastatin). HMG-CoA reductase inhibitors may exacerbate exercise-induced skeletal muscle injury. Many experts favor getting a baseline creatine kinase (CK) measurement before initiating therapy (asymptomatic CK elevations are common). Obtain a CK measurement if patient complains of muscle soreness, tenderness, or pain.

Anesthesia and Critical Care Concerns/Other Considerations **Myopathy:** Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years), gender (occurs in women more frequently than men), small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, and drug interactions (use with caution or avoid).

Based on current research, HMG-CoA reductase inhibitors should be continued in the perioperative period. Postoperative discontinuation of statin therapy is associated with an increased risk of cardiac morbidity and mortality.

Atovaquone and Proguanil

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(a TOE va kwone & pro GWA nil)

U.S. Brand NamesMalarone®

Canadian Brand NamesMalarone®; Malarone® Pediatric

Pharmacologic CategoryAntimalarial Agent

Use: Labeled IndicationsPrevention or treatment of acute, uncomplicated *P. falciparum* malaria

Dosing: AdultsDoses given in mg of atovaquone and proguanil:

Prevention of malaria: Oral: Atovaquone/proguanil 250 mg/100 mg once daily; start 1-2 days prior to entering a malaria-endemic area, continue throughout the stay and for 7 days after returning.

Treatment of acute malaria: Oral: Atovaquone/proguanil 1 g/400 mg as a single dose, once daily for 3 consecutive days

Dosing: ElderlyRefer to adult dosing. Use with caution due to possible decrease in renal and hepatic function, as well as possible decreases in cardiac function, concomitant diseases, or other drug therapy.

Dosing: PediatricDoses given in mg of atovaquone and proguanil (dosage based on body weight):

Prevention of malaria: Oral: Start 1-2 days prior to entering a malaria-endemic area, continue throughout the stay and for 7 days after returning. Take as a single dose, once daily.

11-20 kg: Atovaquone/proguanil 62.5 mg/25 mg

21-30 kg: Atovaquone/proguanil 125 mg/50 mg

31-40 kg: Atovaquone/proguanil 187.5 mg/75 mg

>40 kg: Atovaquone/proguanil 250 mg/100 mg

Treatment of acute malaria: Oral: Take as a single dose, once daily for 3 consecutive days.

5-8 kg: Atovaquone/proguanil 125 mg/50 mg

9-10 kg: Atovaquone/proguanil 187.5 mg/75 mg

11-20 kg: Atovaquone/proguanil 250 mg/100 mg

21-30 kg: Atovaquone/proguanil 500 mg/200 mg

31-40 kg: Atovaquone/proguanil 750 mg/300 mg

>40 kg: Atovaquone/proguanil 1 g/400 mg

Dosing: Renal ImpairmentNo dosage adjustment required in mild-to-moderate renal impairment. Contraindicated as prophylaxis in severe renal impairment (Cl_{cr} <30 mL/minute). May use for 3-day treatment in patients with severe renal impairment if benefit outweighs risk.

Dosing: Hepatic ImpairmentNo dosage adjustment required in mild-to-moderate hepatic impairment. No data available for use in severe hepatic impairment.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister with food or milk-based drink at the same time each day. If patient vomits within 1 hour of administration, repeat the dose. For children who have difficulty swallowing tablets, tablets may be crushed and mixed with condensed milk just prior to administration.

Dietary ConsiderationsMust be taken with food or a milky drink.

StorageStore tablets at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to atovaquone, proguanil, or any component of the formulation; prophylactic use in severe renal impairment (Cl_{cr} <30 mL/minute)

Warnings/Precautions

Concerns related to adverse events:

- Hepatic effects: Increased transaminase levels and hepatitis (rare) have been reported with prophylactic use; single case report of hepatic failure requiring transplantation documented. Monitor closely and use caution in patients with existing hepatic impairment. Data from clinical trials indicates that elevations in AST/ALT may persist for up to 4 weeks following treatment.

Disease-related concerns:

- Diarrhea/vomiting: Absorption of atovaquone may be decreased in patients who have diarrhea or vomiting; monitor closely and consider use of an antiemetic. If severe, consider use of an alternative antimalarial.

- Malaria: Appropriate use: Not indicated for severe or complicated malaria. Delayed cases of *P. falciparum* malaria may occur after stopping prophylaxis; travelers returning from endemic areas who develop febrile illnesses should be evaluated for malaria. Recrudescent infections or infections following prophylaxis with this agent should be treated with alternative agent(s).

- Renal impairment: Use with caution in patients with pre-existing renal disease. May use with caution for treatment of malaria in patients with severe renal impairment (Cl_{cr} <30 mL/minute) if benefit outweighs risk. Contraindicated for prophylactic use in severe renal impairment.

Special populations:

- Pediatrics: Not for use in patients <5 kg (treatment) or <11 kg (prophylaxis).

Pregnancy Risk FactorC

Pregnancy ConsiderationsUse in pregnant women only if the potential benefit outweighs the possible risk to the fetus. There are no adequate and well-controlled studies of atovaquone and/or proguanil in pregnant women. Because *P. falciparum* malaria can cause maternal death and fetal loss, pregnant women traveling to malaria-endemic areas must use personal protection against mosquito bites.

Lactation

Atovaquone: Excretion in breast milk unknown/use caution

Proguanil: Enters breast milk (small amounts)/use caution

Adverse ReactionsThe following adverse reactions were reported in patients being treated for malaria. When used for prophylaxis, reactions are similar to those seen with placebo.

>10%:

Gastrointestinal: Abdominal pain (17%), nausea (12%), vomiting (children 10% to 13%, adults 12%)

Hepatic: Transaminase increases (ALT 27%, AST 17%; increased LFT values typically normalized after ~4 weeks)

1% to 10%:

Central nervous system: Headache (10%), dizziness (5%)

Dermatologic: Pruritus (children 6%)

Gastrointestinal: Diarrhea (children 6%, adults 8%), anorexia (5%)

Neuromuscular & skeletal: Weakness (8%)

Postmarketing and/or case reports: Anaphylaxis, anemia (rare), angioedema, erythema multiforme, hallucinations, hepatitis, hepatic failure (case report), neutropenia, pancytopenia (with severe renal impairment), photosensitivity, psychotic episodes, rash, seizure, Stevens-Johnson syndrome, urticaria

Metabolism/Transport EffectsProguanil: **Substrate** (minor) of 1A2, 2C19, 3A4

Drug Interactions

Antipsychotic Agents (Phenothiazines): Antimalarial Agents may increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Indinavir: Atovaquone may decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Atovaquone. *Risk D: Consider therapy modification*

Ritonavir: May decrease the serum concentration of Atovaquone. *Risk C: Monitor therapy*

Tetracycline: May decrease the serum concentration of Atovaquone. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Atovaquone taken with dietary fat increases the rate and extent of absorption.

Herb/Nutraceutical: Herbs with hypoglycemic properties may enhance the hypoglycemic effect of atovaquone. This includes alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle.

Nursing: Physical Assessment/MonitoringSee individual agent for Atovaquone.

Patient EducationSee individual agent for Atovaquone.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, oral:

Malarone®: Atovaquone 250 mg and proguanil hydrochloride 100 mg

Tablet, oral [pediatric]:

Malarone®: Atovaquone 62.5 mg and proguanil hydrochloride 25 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Malarone)

62.5-25 mg (7): $26.99

250-100 mg (7): $48.95

Mechanism of Action

Atovaquone: Selectively inhibits parasite mitochondrial electron transport.

Proguanil: The metabolite cycloguanil inhibits dihydrofolate reductase, disrupting deoxythymidylate synthesis. Together, atovaquone/cycloguanil affect the erythrocytic and exoerythrocytic stages of development.

Pharmacodynamics/Kinetics

Atovaquone: See Atovaquone.

Proguanil:

Absorption: Extensive

Distribution: 42 L/kg

Protein binding: 75%

Metabolism: Hepatic to active metabolites, cycloguanil (via CYP2C19) and 4-chlorophenylbiguanide

Half-life elimination: 12-21 hours

Excretion: Urine (40% to 60%)

Related Information

- Atovaquone
- Malaria Treatment

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay produce abnormal dreams; may rarely cause seizures and hallucinations

Mental Health: Effects on Psychiatric TreatmentSignificant adverse GI effects; use caution with SSRIs

Index TermsAtovaquone and Proguanil Hydrochloride; Proguanil and Atovaquone; Proguanil Hydrochloride and Atovaquone

International Brand NamesMalalone (KP); Malarone (AU, BE, CH, CZ, DE, DK, EE, ES, FI, FR, GB, HK, IE, IL, IT, MY, NO, PE, PT, SE, SG)

English English

Jump To Field (Select Field Name)

Pronunciation(a TOE va kwone)
U.S. Brand NamesMepron®
Canadian Brand NamesMepron®
Pharmacologic CategoryAntiprotozoal
Use: Labeled IndicationsAcute oral treatment of mild-to-moderate *Pneumocystis jirovecii* pneumonia (PCP) in patients who are intolerant to co-trimoxazole; prophylaxis of PCP in patients who are intolerant to co-trimoxazole
Use: Unlabeled/InvestigationalTreatment of babesiosis; treatment/suppression of *Toxoplasma gondii* encephalitis; primary prophylaxis of HIV-infected persons at high risk for developing *Toxoplasma gondii* encephalitis
Dosing: Adults

Prevention of PCP: Oral: 1500 mg once daily with food

Treatment of mild-to-moderate PCP: Oral: 750 mg twice daily with food for 21 days

Babesiosis (unlabeled use): 750 mg twice daily with azithromycin for 7-10 days

***Toxoplasma gondii*encephalitis (unlabeled use; AIDSinfo guidelines):** Oral:

Prophylaxis: 1500 mg once daily with food

Treatment: 750 mg 4 times daily or 1500 mg twice daily with food for at least 6 weeks after resolution of signs and symptoms

Suppression after treatment: 750 mg 2-4 times/day with food

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Children <13 years (unlabeled uses, AIDSinfo guidelines):

Prevention of PCP: Oral:

1-3 months: 30 mg/kg once daily with food

4-24 months: 45 mg/kg once daily with food

>24 months: 30 mg/kg once daily with food

Treatment of mild-to-moderate PCP: Oral:

Birth to 3 months: 30-40 mg/kg/day in 2 divided doses with food (maximum: 1500 mg/day)

3-24 months: 45 mg/kg/day in 2 divided doses with food

≥24 months: 30-40 mg/kg/day in 2 divided doses with food (maximum: 1500 mg/day)

Babesiosis: Oral: 20 mg/kg/day in 2 divided doses with food for 7-10 days

Toxoplasma gondii*prophylaxis:* Oral:

1-3 months: 30 mg/kg once daily with food

4-24 months: 45 mg/kg once daily with food

>24 months: 30 mg/kg once daily with food

Adolescents 13-16 years: Refer to adult dosing.
Administration: OralMust be taken administered meals. Shake suspension gently before use. Once opened, the foil pouch can be emptied on a dosing spoon, in a cup, or directly into the mouth.
Dietary ConsiderationsMust be taken with meals.
StorageStore at 15°C to 25°C (59°F to 77°F). Do not freeze.
ContraindicationsLife-threatening allergic reaction to atovaquone or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Diarrhea/vomiting: Absorption may be decreased in patients who have diarrhea or vomiting; monitor closely and consider use of an antiemetic. If severe, consider use of an alternative antimalarial.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with severe hepatic impairment; rare cases of hepatitis, elevated liver function tests, and liver failure have been reported.

- *Pneumocystis jirovecii* pneumonia (PCP): Appropriate use: When used for treatment, has only been indicated in mild-to-moderate PCP; not studied for use in severe PCP.

Special populations:

- Elderly: Use with caution in elderly patients due to potentially impaired renal, hepatic, and cardiac function.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies of atovaquone in pregnant women. Use in pregnant women only if the potential benefit outweighs the possible risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**Note:** Adverse reaction statistics have been compiled from studies including patients with advanced HIV disease. Consequently, it is difficult to distinguish reactions attributed to atovaquone from those caused by the underlying disease or a combination thereof.

>10%:

Central nervous system: Fever (14% to 40%), headache (16% to 31%), insomnia (10% to 19%), depression, pain

Dermatologic: Rash (22% to 46%), pruritus (5% to ≥10%)

Gastrointestinal: Diarrhea (19% to 42%), nausea (21% to 32%), vomiting (14% to 22%), abdominal pain (4% to 21%)

Neuromuscular & skeletal: Weakness (8% to 31%), myalgia

Respiratory: Cough (14% to 25%), rhinitis (5% to 24%), dyspnea (15% to 21%), sinusitis (7% to ≥10%)

Miscellaneous: Infection (18% to 22%), diaphoresis, flu-like syndrome

1% to 10%:

Cardiovascular: Hypotension (≤1%)

Central nervous system: Dizziness (3% to 8%), anxiety (≤7%)

Endocrine & metabolic: Hyponatremia (7% to 10%), hyperglycemia (≤9%), hypoglycemia (≤1%)

Gastrointestinal: Amylase increased (7% to 8%), anorexia (≤7%), dyspepsia (≤5%), constipation (≤3%), taste perversion (≤3%)

Hematologic: Anemia (4% to 6%), neutropenia (3% to 5%)

Hepatic: Liver enzymes increased (4% to 8%)

Renal: BUN increased (≤1%), creatinine increased (≤1%)

Respiratory: Bronchospasm (2% to 4%)

Miscellaneous: Oral moniliasis (5% to 10%)

Postmarketing and/or case reports: Acute renal failure, allergic reaction, angioedema, erythema multiforme, hepatitis (rare), hypersensitivity reactions, liver failure (rare), methemoglobinemia, pancreatitis, skin desquamation, Stevens-Johnson syndrome, throat tightness, thrombocytopenia, urticaria, vortex keratopathy

Drug Interactions

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Indinavir: Atovaquone may decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Atovaquone. *Risk D: Consider therapy modification*

Ritonavir: May decrease the serum concentration of Atovaquone. *Risk C: Monitor therapy*

Tetracycline: May decrease the serum concentration of Atovaquone. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Ingestion with a fatty meal increases absorption.

Herb/Nutraceutical: Herbs with hypoglycemic properties may enhance the hypoglycemic effect of atovaquone. This includes alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle.

Nursing: Physical Assessment/MonitoringMonitor for CNS and respiratory changes and patient's knowledge of adverse reactions. Assess for interactions with other prescription or OTC medications.

Patient EducationTake as directed. Take with high-fat meals. You may experience dizziness or lightheadedness; use caution when driving or engaging in tasks that require alertness until response to drug is known. Small meals may help reduce nausea. Report unresolved diarrhea, fever, mouth sores (use good mouth care), unresolved headache, or vomiting. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, oral:

Mepron®: 750 mg/5 mL (5 mL, 210 mL) [contains benzyl alcohol; citrus flavor]

Generic AvailableNo
ManufacturerGlaxoSmithKline
Mechanism of ActionInhibits electron transport in mitochondria resulting in the inhibition of key metabolic enzymes responsible for the synthesis of nucleic acids and ATP
Pharmacodynamics/Kinetics

Absorption: Significantly increased with a high-fat meal

Distribution: V_{dss}: 0.6 ± 17 L/kg

Protein binding: >99%

Metabolism: Undergoes enterohepatic recirculation

Bioavailability: 32% to 62%

Half-life elimination: 1.5-4 days

Excretion: Feces (>94% as unchanged drug); urine (<1%)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(a tra KYOO ree um)

Canadian Brand NamesAtracurium Besylate Injection

Pharmacologic CategoryNeuromuscular Blocker Agent, Nondepolarizing

Use: Labeled IndicationsAdjunct to general anesthesia to facilitate endotracheal intubation and to relax skeletal muscles during surgery; to facilitate mechanical ventilation in ICU patients; does not relieve pain or produce sedation

Dosing: AdultsFor I.V. administration only (not to be used I.M.): Dose to effect; doses must be individualized due to interpatient variability; use ideal body weight for obese patients.

Adjunct to surgical anesthesia (neuromuscular blockade):

I.V. (bolus): 0.4-0.5 mg/kg, then 0.08-0.1 mg/kg 20-45 minutes after initial dose to maintain neuromuscular block, followed by repeat doses of 0.08-0.1 mg/kg at 15- to 25-minute intervals

Initial dose after succinylcholine for intubation (balanced anesthesia): 0.2-0.4 mg/kg

Pretreatment/priming: I.V.: 10% of intubating dose given 3-5 minutes before initial dose

I.V. continuous infusion: Initial: 9-10 mcg/kg/minute at initial signs of recovery from bolus dose; block is usually maintained by a rate of 5-9 mcg/kg/minute under balanced anesthesia.

ICU neuromuscular blockade: I.V.: Initial (bolus) 0.4-0.5 mg/kg, followed by I.V. continuous infusion at an initial rate of 5-10 mcg/kg/minute; block is usually maintained by rate of 11-13 mcg/kg/minute (rates for pediatric patients may be higher).

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Adjunct to surgical anesthesia:** I.V. (not to be used I.M.): Dose to effect; doses must be individualized due to interpatient variability; use ideal body weight for obese patients

Children 1 month to 2 years: Initial: 0.3-0.4 mg/kg followed by maintenance doses as needed to maintain neuromuscular blockade

Children >2 years: Refer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentNo adjustment is necessary.

Calculations

- Atracurium

Administration: I.M.Not for I.M. injection due to tissue irritation.

Administration: I.V.May be given undiluted as a bolus injection. Administration via infusion requires the use of an infusion pump. Use infusion solutions within 24 hours of preparation.

Administration: I.V. DetailpH: 3.25-3.65 (adjusted)

StorageRefrigerate intact vials at 2°C to 8°C (36°F to 46°F). Protect from freezing. Use vials within 14 days upon removal from the refrigerator to room temperature of 25°C (77°F). Dilutions of 0.2 mg/mL or 0.5 mg/mL in 0.9% sodium chloride, dextrose 5% in water, or 5% dextrose in sodium chloride 0.9% are stable for up to 24 hours at room temperature or under refrigeration.

ReconstitutionAtracurium should not be mixed with alkaline solutions.

CompatibilityStable in D_5W, NS, D_5NS; **incompatible** with LR.

Y-site administration: Compatible: Cefazolin, cefuroxime, cimetidine, clarithromycin, dobutamine, dopamine, epinephrine, esmolol, etomidate, fentanyl, gentamicin, heparin, hydrocortisone sodium succinate, isoproterenol, lorazepam, midazolam, milrinone, morphine, nitroglycerin, ranitidine, sodium nitroprusside, trimethoprim/sulfamethoxazole, vancomycin. **Incompatible:** Diazepam, propofol, thiopental.

Compatibility in syringe: Compatible: Alfentanil, fentanyl, midazolam, sufentanil.

Compatibility when admixed: Compatible: Bretylium, cimetidine, dobutamine, dopamine, esmolol, gentamicin, isoproterenol, lidocaine, morphine, potassium chloride, procainamide, vancomycin. **Incompatible:** Aminophylline, cefazolin, heparin, quinidine gluconate, ranitidine, sodium nitroprusside.

ContraindicationsHypersensitivity to atracurium besylate or any component of the formulation

Allergy Considerations

- Neuromuscular-Blocking Agent Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bradycardia: May be more common with atracurium than with other neuromuscular-blocking agents since it has no clinically-significant effects on heart rate to counteract the bradycardia produced by anesthetics.
- Neuromuscular cross-sensitivity: Cross-sensitivity with other neuromuscular-blocking agents may occur; use extreme caution in patients with previous anaphylactic reactions.

Disease-related concerns:

- Burn injury: Resistance may occur in burn patients (>30% of body) for period of 5-70 days postinjury.
- Conditions which may antagonize neuromuscular blockade: Alkalosis, hypercalcemia, demyelinating lesions, peripheral neuropathies, denervation, infection, muscle trauma, and diabetes mellitus may result in antagonism of neuromuscular blockade.
- Conditions which may potentiate neuromuscular blockade: Electrolyte abnormalities, severe hyponatremia, severe hypocalcemia, severe hypokalemia, hypermagnesemia, neuromuscular diseases, acidosis, acute intermittent porphyria, Eaton-Lambert syndrome, myasthenia gravis, renal failure, and hepatic failure may result in potentiation of neuromuscular blockade.

Special populations:

- Elderly: Use with caution in the elderly, effects and duration are more variable.
- Immobilized patients: Resistance may occur in patients who are immobilized.

Other warnings/precautions:

- Appropriate use: Maintenance of an adequate airway and respiratory support is critical. Resistance may develop with chronic treatment.
- Experienced personnel: Should be administered by adequately trained individuals familiar with its use.
- Histamine release: Reduce initial dosage and inject slowly (over 1-2 minutes) in patients in whom substantial histamine release would be potentially hazardous (eg, patients with clinically-important cardiovascular disease).

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsMild, rare, and generally suggestive of histamine release

1% to 10%: Cardiovascular: Flushing

<1%: Bronchial secretions, erythema, hives, itching, wheezing

Postmarketing and/or case reports: Allergic reaction, bradycardia, bronchospasm, dyspnea, hypotension, injection site reaction, seizure, acute quadriplegic myopathy syndrome (prolonged use), laryngospasm, myositis ossificans (prolonged use), tachycardia, urticaria

Causes of prolonged neuromuscular blockade: Excessive drug administration; cumulative drug effect, metabolism/excretion decreased (hepatic and/or renal impairment); accumulation of active metabolites; electrolyte imbalance (hypokalemia, hypocalcemia, hypermagnesemia, hypernatremia); hypothermia

Drug Interactions

Acetylcholinesterase Inhibitors: May diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). Acetylcholinesterase Inhibitors may decrease the metabolism of Neuromuscular-Blocking Agents (Nondepolarizing). This is only true for mivacurium in which case the neuromuscular blocking effects might be prolonged. *Risk C: Monitor therapy*

Aminoglycosides: May enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Neuromuscular-Blocking Agents may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Neuromuscular-Blocking Agents may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Calcium Channel Blockers: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Cardiac Glycosides: Neuromuscular-Blocking Agents may enhance the arrhythmogenic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Colistimethate: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Neuromuscular-Blocking Agents (Nondepolarizing) may enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

Inhalational Anesthetics: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Neuromuscular-Blocking Agents (Nondepolarizing). Specifically, episodes of apnea have been reported in patients using this combination. *Risk C: Monitor therapy*

Lincosamide Antibiotics: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Lithium: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Loop Diuretics: May diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Loop Diuretics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Magnesium Salts: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Polymyxin B: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Procainamide: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

QuiNIDine: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Tetracycline Derivatives: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Vancomycin: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Monitoring ParametersVital signs (heart rate, blood pressure, respiratory rate); degree of muscle relaxation (via peripheral nerve stimulator and presence of spontaneous movement); renal function (serum creatinine, BUN) and liver function when in ICU

In the ICU setting, prolonged paralysis and generalized myopathy, following discontinuation of agent, may be minimized by appropriately monitoring degree of blockade.

Nursing: Physical Assessment/MonitoringOnly clinicians experienced in the use of neuromuscular-blocking drugs should administer and/or manage the use of atracurium. Dosage and rate of administration should be individualized and titrated to the desired effect, according to relevant clinical factors, premedication, concomitant medications, age, and general condition of the patient. Ventilatory support must be instituted and maintained until adequate respiratory muscle function and/or airway protection are assured. Assess other medications for effectiveness and safety. Other drugs that affect neuromuscular activity may increase/decrease neuromuscular block induced by atracurium. This drug does not cause anesthesia or analgesia; pain must be treated with appropriate analgesic agents. Continuous monitoring of vital signs, cardiac status, respiratory status, and degree of neuromuscular block (objective assessment with peripheral external nerve stimulator) is mandatory during infusion and until full muscle tone has returned. Muscle tone returns in a predictable pattern, starting with diaphragm, abdomen, chest, limbs, and finally muscles of the neck, face, and eyes. Safety precautions must be maintained until full muscle tone has returned. **Note:** It may take longer for return of muscle tone in obese or elderly patients or patients with renal or hepatic disease, myasthenia gravis, myopathy, other neuromuscular disease, dehydration, electrolyte imbalance, or severe acid/base imbalance. Provide appropriate patient teaching/support prior to and following administration.

Long-term use: Monitor fluid levels (intake and output) during and following infusion. Reposition patient and provide appropriate skin care, mouth care, and care of patient's eyes every 2-3 hours while sedated. Provide appropriate emotional and sensory support (auditory and environmental).

Monitoring: Lab TestsRenal function (serum creatinine, BUN) and liver function when in ICU

Patient EducationPatient will usually be unconscious prior to administration. Patient education should be appropriate to individual situation. Reassurance of constant monitoring and emotional support to reduce fear and anxiety should precede and follow administration. Following return of muscle tone, do not attempt to change position or rise from bed without assistance. Report immediately any skin rash or hives, pounding heartbeat, respiratory difficulty, or muscle tremors. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, as besylate: 10 mg/mL (10 mL) [contains benzyl alcohol]

Injection, as besylate [preservative free]: 10 mg/mL (5 mL)

Generic AvailableYes

Mechanism of ActionBlocks neural transmission at the myoneural junction by binding with cholinergic receptor sites

Pharmacodynamics/Kinetics

Onset of action (dose dependent): 2-3 minutes

Duration: Recovery begins in 20-35 minutes following initial dose of 0.4-0.5 mg/kg under balanced anesthesia; recovery to 95% of control takes 60-70 minutes

Metabolism: Undergoes ester hydrolysis and Hofmann elimination (nonbiologic process independent of renal, hepatic, or enzymatic function); metabolites have no neuromuscular blocking properties; laudanosine, a product of Hofmann elimination, is a CNS stimulant and can accumulate with prolonged use. Laudanosine is hepatically metabolized.

Half-life elimination: Biphasic: Adults: Initial (distribution): 2 minutes; Terminal: 20 minutes

Excretion: Urine (<5%)

Related Information

- Neuromuscular-Blocking Agents

Pharmacotherapy PearlsAtracurium is classified as an intermediate-duration neuromuscular-blocking agent. It does not appear to have a cumulative effect on the duration of blockade. It does not relieve pain or produce sedation.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other ConsiderationsAtracurium is classified as an intermediate duration neuromuscular-blocking agent; does not appear to have a cumulative effect on the duration of blockade.

Critically-Ill Adult Patients:

The 2008 Surviving Sepsis Campaign guidelines recommend avoiding use of neuromuscular blockers if at all possible in the septic patient due to the risk of prolonged neuromuscular blockade following discontinuation. If one is required, monitor the depth of blockade (Grade 1B).

The 2002 ACCM/SCCM/ASHP clinical practice guidelines for sustained neuromuscular blockade in the adult critically-ill patient recommend:

Optimize sedatives and analgesics prior to initiation, and monitor and adjust accordingly during course. Neuromuscular blockers do not relieve pain or produce sedation.

Protect patient's eyes from development of keratitis and corneal abrasion by administering ophthalmic ointment and taping eyelids closed or using eye patches. Reposition patient routinely to protect pressure points from breakdown. Address DVT prophylaxis.

Concurrent use of a neuromuscular blocker and corticosteroids appear to increase the risk of certain ICU myopathies; avoid or administer the corticosteroid at the lowest dose possible. Reassess need for neuromuscular blocker daily.

Using daily drug holidays (stopping neuromuscular-blocking agent until patient requires it again) may decrease the incidence of acute quadriplegic myopathy syndrome.

Tachyphylaxis can develop; switch to another neuromuscular blocker (taking into consideration the patient's organ function) if paralysis is still necessary.

Acidosis and severe hypothermia may delay the elimination of atracurium and cisatracurium.

Atracurium or cisatracurium is recommended for patients with significant hepatic or renal disease due to organ-independent Hofmann elimination.

Monitor patients clinically and via “Train of Four” (TOF) testing with a goal of adjusting the degree of blockade to 1-2 twitches or based upon the patient's clinical condition.

Index TermsAtracurium Besylate

Jump To Field (Select Field Name)

Pronunciation(A troe peen & pra li DOKS eem)

U.S. Brand NamesATNAA; Duodote™

Pharmacologic CategoryAnticholinergic Agent; Antidote

Use: Labeled Indications

ATNAA: Treatment of poisoning by susceptible organophosphorous nerve agents having anticholinesterase activity for self or buddy-administration by military personnel

Duodote™: Treatment of poisoning by organophosphorous nerve agents (eg, tabun, sarin, soman) or organophosphorous insecticide for use by trained emergency medical services personnel

Dosing: AdultsOrganophosphorous poisoning: I.M.: **Note:** If suspected, antidotal therapy should be given immediately as soon as symptoms appear (critical to administer immediately in case of soman exposure). Definitive medical care should be sought after any injection given. One injection only may be given as self-aid. If repeat injections needed, administration must be done by another trained individual. Emergency medical personnel who have self-administered a dose must determine capacity to continue to provide care.

ATNAA:

Mild symptoms (some or all mild symptoms): Self-Aid or Buddy-Aid: 1 injection (wait 10-15 minutes for effect); if patient is able to ambulate, and knows who and where they are, then no more injections are needed. If symptoms still present: Buddy-Aid: May repeat 1-2 more injections

Severe symptoms (if most or all): Buddy-Aid: If no self-aid given, 3 injections in rapid succession; if 1 self-aid injection given, 2 injections in rapid succession

Maximum cumulative dose: 3 injections

Symptoms provided by manufacturer in ATNAA product labeling to guide therapy:

Mild symptoms: Breathing difficulties, chest tightness, coughing, difficulty in seeing, drooling, headache, localized sweating and muscular twitching, miosis, nausea (with or without vomiting), runny nose, stomach cramps, tachycardia (followed by bradycardia), wheezing

Severe symptoms: Bradycardia, confused/strange behavior, convulsions, increased wheezing and breathing difficulties, involuntary urination/defecation, miosis (severe), muscular twitching/generalized weakness (severe), red/teary eyes, respiratory failure, unconsciousness, vomiting

Duodote™:

Mild symptoms (≥2 mild symptoms): 1 injection (wait 10-15 minutes for effect); if after 10-15 minutes no severe symptoms emerge, no further injections are indicated; if any severe symptoms emerge at any point following initial injection, repeat dose by giving 2 additional injections in rapid succession. Transport to medical care facility.

Severe symptoms (≥1 severe symptom): 3 injections in rapid succession. Transport to medical care facility.

Maximum cumulative dose: 3 injections unless medical care support (eg, hospital, respiratory support) is available

Symptoms provided by manufacturer in Duodote™ product labeling to guide therapy:

Mild symptoms: Airway secretions increased, blurred vision, bradycardia, breathing difficulties, chest tightness, drooling miosis, nausea, vomiting, runny nose, salivation, stomach cramps (acute onset), tachycardia, teary eyes, tremors/muscular twitching, wheezing/coughing

Severe symptoms: Breathing difficulties (severe), confused/strange behavior, convulsions, copious secretions from lung or airway, involuntary urination/defecation, muscular twitching/generalized weakness (severe)

Dosing: ElderlyRefer to adult dosing. No dosing adjustment recommended.

Dosing: Renal ImpairmentUse caution in renal impairment; pralidoxime is renally eliminated.

Administration: I.M.Self-administration: Hold device firmly at center with green tip (needle end) pointing down; remove gray safety release with other hand; do not touch green tip at any time. The device is ready for administration into the mid-outer thigh; removal of clothing is not necessary, but pockets should be empty. Swing at a 90° angle to allow the green tip to push against the mid-outer thigh. Hold firmly in place until auto-injector triggers and an additional 10 seconds after device has triggered. After administration, needle will be visible; if needle is not visible, repeat above steps. After use, bend needle against a hard surface (needle does not retract) to avoid accidental injury.

ATNAA: May be administered in lateral thigh muscle or buttocks

StorageStore at 15°C to 30°C (59°F to 86°F); avoid freezing. Protect from light.

Restrictions

ATNAA (**A**ntidote **T**reatment-**N**erve **A**gent **A**uto-Injector) is only available for use by U.S. Armed Forces military personnel. Information on distribution is available at Defense Services Supply Center-Philadelphia at https://dmmonline.dscp.dla.mil/pharm/nerve.asp

Duodote™ is only available for use by trained emergency medical services personnel to treat civilians. Distribution is limited to directly from manufacturer (Meridian Medical Technologies, Inc.) to emergency medical service organizations or their suppliers.

ContraindicationsHypersensitivity to atropine, pralidoxime, or any component of the formulation; no contraindications exist in the treatment of life-threatening organophosphorous poisoning

Warnings/Precautions

Concerns related to adverse effects:

- Atropinization: Signs of atropinization (eg, flushing, mydriasis, tachycardia, dryness of mouth or nose) may occur earlier than expected with use of combination product compared to atropine alone. Monitor effects closely when administering subsequent injections as necessary.

- Hyperthermia: Atropine may inhibit sweating and possibly lead to heat injury or hyperthermia in patients exposed to warm environments or exercise.

Disease-related concerns: The following diseases are precautions only when symptoms of poisoning are **not** severe:

- Cardiovascular disease: Use with caution in patients with heart disease, arrhythmias (eg, atrial flutter), severe CAD, or history of recent MI; treatment-related blood pressure increases and tachycardia may lead to ischemia, precipitate an MI, or increase arrhythmogenic potential.

- Chronic lung disease: Use with caution in patients with chronic lung disease patients; may cause inspiration of bronchial secretions and formation of dangerous viscid plugs.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; may precipitate myasthenic crisis.

- Narrow-angle glaucoma: Use with caution in patients with severe narrow-angle glaucoma; may precipitate acute glaucoma.

- Prostatic hyperplasia: Use with caution in patients with prostatic hyperplasia; may cause urinary retention.

- Pyloric stenosis: Use with caution in patients with pyloric stenosis; may cause complete pyloric obstruction.

- Renal impairment: Use with caution in renal impairment; pralidoxime is excreted renally.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to the anticholinergic effects of atropine.

- Pediatrics: Safety and efficacy have not been established in children. Children may be more sensitive to the anticholinergic effects of atropine.

Other warnings/precautions:

- Appropriate use: Clinical symptoms consistent with highly-suspected organophosphorous poisoning should be treated with antidote immediately; administration should not be delayed for confirmatory laboratory tests. Treatment should always include proper evacuation and decontamination procedures; medical personnel should protect themselves from inadvertent contamination. Antidotal administration is intended only for initial management; definitive and more extensive medical care is required following administration. Individuals should not rely solely on antidote for treatment, as other supportive measures (eg, artificial respiration) may still be required.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Also refer to individual agents.

Lactation

Atropine: Enters breast milk (trace amounts)/use caution (AAP rates “compatible”)

Pralidoxime: Excretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsSee individual agents.

Adverse ReactionsAlso see individual agents.

Reactions reported with Duodote™. Frequency not defined:

Cardiovascular: Blood pressure increased (transient; usually occurring 15 minutes after administration and returning to baseline 4 hours postdose)

Local: Injection site muscle tightness and pain (mild-to-moderate)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Monitoring ParametersRespiratory status, ABGs, pulse oximeter; body temperature (especially in warm climates); blood pressure (peak effect occurs ~15 minutes after administration); symptoms of poisoning

Reference RangeDirect measurement of RBC acetylcholinesterase activity provides a measure of degree of toxicity, although symptoms may not correlate with degree of inactivation unless activity reduced to <50%. Sequential measurement (if rapidly available) may help determine the effectiveness of oxime therapy. Plasma (or pseudo) cholinesterase activity is more easily performed, but does not correlate well with severity and should not be used to guide therapy.

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationThis medication will only be administered in an emergency situation. Primary protection against exposure to chemical nerve agents and insecticide poisoning is the wearing of protective garments and mask. Evacuation and decontamination should be done as soon as possible.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

ATNAA, Duodote™: Atropine 2.1 mg/0.7 mL and pralidoxime chloride 600 mg/2 mL [contains benzyl alcohol; prefilled autoinjector]

Generic AvailableNo

ManufacturerMeridian Medical Technologies™, Inc

Mechanism of Action

Atropine: Functions as a competitive antagonist of acetylcholine at muscarinic receptors in the peripheral and central nervous system, thus reducing the symptoms of parasympathetic overstimulation resulting from excess acetylcholine caused by organophosphorous poisoning. Parasympatholytic action of atropine decreases oral and respiratory secretions, relieves airway constriction, and attenuates the bradycardia induced by organophosphates. Antagonizes acetylcholine accumulation at respiratory center and may reduce centrally-mediated respiratory paralysis.

Pralidoxime: An oxime which functions by way of nucleophilic attack on the ester site of the acetylcholinesterase enzyme deactivated by phosphorylation. Displacement of the phosphoryl group allows reactivation of acetylcholinesterase's hydrolytic activity, thus permitting renewed catalysis of accumulated acetylcholine. Destruction of accumulated acetylcholine allows for restoration of normal functioning at neuromuscular junctions and relief of respiratory muscle paralysis.

Pharmacodynamics/KineticsSee individual agents.

Pharmacotherapy PearlsEvacuation and decontamination procedures should be undertaken as soon as possible. Medical personnel need to protect themselves from accidental exposure. Primary prophylaxis against organophosphorous nerve agents should always consist of appropriate protective garments and masks. Organophosphate agents are well absorbed through skin, lungs, and GI tract. They are usually described as having a petroleum or garlic like odor. Once absorbed, organophosphate agents bind to acetylcholinesterase (also known as RBC acetylcholinesterases) and inactivate the enzyme. Acetylcholinesterases catalyze the hydrolysis of acetylcholine to choline and acetic acid; therefore, once inactivated excess acetylcholine accumulates.

Clinical symptoms of toxicity are associated with cholinergic excess and involve the autonomic nervous system, CNS, and neuromuscular junction. Clinical features of acute cholinergic toxicity include bradycardia, miosis, lacrimation, salivation, bronchorrhea, bronchospasm, emesis and diarrhea. At times, mydriasis and tachycardia may be observed. 100% oxygen and fluid resuscitation are important initial steps in management. Onset and duration of clinical features consistent with poisoning vary depending on agent and route of exposure; therefore, every effort should be made to identify poisoning agent. In addition, time interval to "aging" process (irreversible binding between organophosphates and acetylcholinesterase) vary depending on nerve agent. Once "aging" has occurred, oxime therapy (eg, pralidoxime) is ineffective, thus making timing of antidote administration critical, particularly in the case of soman exposure where "aging" process occurs within minutes of exposure.

Mental Health: Effects on Mental StatusMay cause ataxia, hallucinations, dizziness, drowsiness, amnesia, difficulty concentrating, agitation, delirium, paranoia, anxiety, and mania

Mental Health: Effects on Psychiatric TreatmentAtropine and pralidoxime may decrease the effects of acetylcholinesterase inhibitors. Concurrent use with psychotropics may result in additive anticholinergic side effects (eg, dry mouth, blurred vision, or constipation); avoid use with phenothiazines; effects of barbiturates may be increased by atropine and pralidoxime

Index TermsAtropine and Pralidoxime Chloride; Mark 1™; NAAK; Nerve Agent Antidote Kit; Pralidoxime and Atropine

Atropine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues
International issues:

Genatropine® [France] may be confused with Genotropin®

Pronunciation(A troe peen)

U.S. Brand NamesAtroPen®; Atropine-Care®; Isopto® Atropine; Sal-Tropine™

Canadian Brand NamesDioptic's Atropine Solution; Isopto® Atropine

Pharmacologic CategoryAnticholinergic Agent; Anticholinergic Agent, Ophthalmic; Antidote; Antispasmodic Agent, Gastrointestinal; Ophthalmic Agent, Mydriatic

Use: Labeled Indications

Injection: Preoperative medication to inhibit salivation and secretions; treatment of symptomatic sinus bradycardia; AV block (nodal level); ventricular asystole; antidote for anticholinesterase inhibitor poisoning (carbamate insecticides, nerve agents, organophosphate insecticides)

Ophthalmic: Produce mydriasis and cycloplegia for examination of the retina and optic disc and accurate measurement of refractive errors; uveitis

Oral: Inhibit salivation and secretions

Use: Unlabeled/InvestigationalPulseless electric activity, asystole, neuromuscular blockade reversal

Use: DentalReduction of salivation and bronchial secretions

Dosing: AdultsDoses <0.5 mg have been associated with paradoxical bradycardia.

Asystole:

I.V.: 1 mg; repeat in 3-5 minutes if asystole persists; total dose of 0.04 mg/kg.

Intratracheal: Administer 2-2.5 times the recommended I.V. dose; dilute in 10 mL NS or distilled water. **Note:** Absorption is greater with distilled water, but causes more adverse effects on PaO_2.

Inhibit salivation and secretions (preanesthesia):

I.M., I.V., SubQ: 0.4-0.6 mg 30-60 minutes preop and repeat every 4-6 hours as needed.

Oral: 0.4 mg; may repeat in 4 hours if necessary; 0.4 mg initial dose may be exceeded in certain cases and may repeat in 4 hours if necessary

Bradycardia:*I.V.:* 0.5-1 mg every 5 minutes, not to exceed a total of 3 mg or 0.04 mg/kg; may give intratracheal in 1 mg/10 mL dilution only, intratracheal dose should be 2-2.5 times the I.V. dose.

Neuromuscular blockade reversal:*I.V.:* 25-30 mcg/kg 30-60 seconds before neostigmine or 7-10 mcg/kg 30-60 seconds before edrophonium

Organophosphate or carbamate poisoning:Note: The dose of atropine required varies considerably with the severity of poisoning. Total amount of atropine used in carbamate poisoning is usually less. Severely poisoned patients may exhibit significant tolerance to atropine; ≥2 times the suggested doses may be needed. Titrate to pulmonary status (decreased bronchial secretions). Once patient is stable for a period of time, the dose/dosing frequency may be decreased. If atropinization occurs after 1-2 mg of atropine then re-evaluate working diagnosis.

I.V.: Initial: 1-5 mg; doses should be doubled every 5 minutes until signs of muscarinic excess abate (clearing of bronchial secretions, bronchospasm, and adequate oxygenation). Overly aggressive dosing may cause anticholinergic toxicity (eg, delirium, hyperthermia, and muscle twitching).

I.V. Infusion: 0.5-1 mg/hour or 10% to 20% of loading dose/hour

I.M.: AtroPen®: Mild symptoms: Administer 2 mg as soon as exposure is known or suspected. If severe symptoms develop after first dose, 2 additional doses should be repeated in 10 minutes; do not administer more than 3 doses. Severe symptoms: Immediately administer three 2 mg doses.

Nerve agent toxicity management: *I.M.:* See **Note**. Prehospital (“in the field”) or hospital/emergency department: Mild-to-moderate symptoms: 2-4 mg; severe symptoms: 6 mg

Note: Pralidoxime is a component of the management of nerve agent toxicity; consult Pralidoxime for specific route and dose.

Prehospital (“in the field”) management: Repeat atropine I.M. (2 mg) at 5-10 minute intervals until secretions have diminished and breathing is comfortable or airway resistance has returned to near normal.

Hospital management: Repeat atropine I.M. (2 mg) at 5-10 minute intervals until secretions have diminished and breathing is comfortable or airway resistance has returned to near normal.

Mydriasis, cycloplegia (preprocedure): *Ophthalmic* (1% solution): Instill 1-2 drops 1 hour before the procedure.

Uveitis: *Ophthalmic:*

1% solution: Instill 1-2 drops 4 times/day.

Ointment: Apply a small amount in the conjunctival sac up to 3 times/day. Compress the lacrimal sac by digital pressure for 1-3 minutes after instillation.

Dosing: ElderlyRefer to adult dosing.

Nerve agent toxicity management: See **Note**. I.M.: Elderly and frail patients:

Prehospital ("in the field"): Mild-to-moderate symptoms: 1 mg; severe symptoms: 2-4 mg

Hospital/emergency department: Mild-to-moderate symptoms: 1 mg; severe symptoms: 2 mg

Note: Pralidoxime is a component of the management of nerve agent toxicity; consult Pralidoxime for specific route and dose.

Prehospital ("in the field") management: Repeat atropine I.M. (2 mg) at 5-10 minute intervals until secretions have diminished and breathing is comfortable or airway resistance has returned to near normal.

Hospital management: Repeat atropine I.M. (2 mg) at 5-10 minute intervals until secretions have diminished and breathing is comfortable or airway resistance has returned to near normal.

Dosing: Pediatric**Note:** Doses <0.1 mg have been associated with paradoxical bradycardia.

Inhibit salivation and secretions (preanesthesia): Oral, I.M., I.V., SubQ: Neonates, Infants, and Children:

Children <5 kg: 0.02 mg/kg/dose 30-60 minutes preop then every 4-6 hours as needed. Use of a minimum dosage of 0.1 mg in neonates <5 kg will result in dosages >0.02 mg/kg. There is no documented minimum dosage in this age group.

Children >5 kg: 0.01-0.02 mg/kg/dose to a maximum 0.4 mg/dose 30-60 minutes preop; minimum dose: 0.1 mg

Alternate dosing:

3-7 kg (7-16 lb): 0.1 mg

8-11 kg (17-24 lb): 0.15 mg

11-18 kg (24-40 lb): 0.2 mg

18-29 kg (40-65 lb): 0.3 mg

>30 kg (>65 lb): 0.4 mg

Bradycardia: I.V., intratracheal: Neonates, Infants, and Children:

0.02 mg/kg, minimum dose 0.1 mg, maximum single dose: 0.5 mg in children and 1 mg in adolescents; may repeat in 5-minute intervals to a maximum total dose of 1 mg in children or 2 mg in adolescents. (**Note:** For intratracheal administration, the dosage must be diluted with normal saline to a total volume of 1-5 mL). When treating bradycardia in neonates, reserve use for those patients unresponsive to improved oxygenation and epinephrine.

Organophosphate or carbamate poisoning:

I.V.: Children: 0.03-0.05 mg/kg every 10-20 minutes until atropine effect, then every 1-4 hours for at least 24 hours

I.M. (AtroPen®): Children: Mild symptoms: Administer dose listed below as soon as exposure is known or suspected. If severe symptoms develop after first dose, 2 additional doses should be repeated in 10 minutes; do not administer more than 3 doses. Severe symptoms: Immediately administer 3 doses as follows:

<6.8 kg (15 lb): Use of **AtroPen® formulation not recommended**; administer atropine 0.05 mg/kg

6.8-18 kg (15-40 lb): 0.5 mg/dose

18-41 kg (40-90 lb): 1 mg/dose

>41 kg (>90 lb): 2 mg/dose

Nerve agent toxicity management: I.M.: Infants and Children: See following **Note**.

Prehospital ("in the field"):

Birth to <2 years: Mild-to-moderate symptoms: 0.05 mg/kg; severe symptoms: 0.1 mg/kg

2-10 years: Mild-to-moderate symptoms: 1 mg; severe symptoms: 2 mg

>10 years: Mild-to-moderate symptoms: 2 mg; severe symptoms: 4 mg

Hospital/emergency department:

Birth to <2 years: Mild-to-moderate symptoms: 0.05 mg/kg I.M. **or** 0.02 mg/kg I.V.; severe symptoms: 0.1 mg/kg I.M. **or** 0.02 mg/kg I.V.

2-10 years: Mild-to-moderate symptoms: 1 mg; severe symptoms: 2 mg

>10 years: Mild-to-moderate symptoms: 2 mg; severe symptoms: 4 mg

Note: Pralidoxime is a component of the management of nerve agent toxicity; consult Pralidoxime for specific route and dose.

Prehospital ("in the field") management: Repeat atropine I.M. (0.05-0.1 mg/kg) at 5-10 minute intervals until secretions have diminished and breathing is comfortable or airway resistance has returned to near normal.

Hospital management: Repeat atropine I.M. (infants: 1 mg; all others: 2 mg) at 5-10 minute intervals until secretions have diminished and breathing is comfortable or airway resistance has returned to near normal.

Administration: I.M.AtroPen®: Administer to outer thigh. May be given through clothing as long as pockets at the injection site are empty. Hold autoinjector in place for 10 seconds following injection; massage the injection site.

Administration: I.V.Administer undiluted by rapid I.V. injection; slow injection may result in paradoxical bradycardia.

Administration: I.V. DetailpH: 3-6.5; AtroPen®: pH: 4-5

Administration: OtherIntratracheal: Dilute in NS or distilled water. Absorption is greater with distilled water, but causes more adverse effects on PaO_2. Pass catheter beyond tip of tracheal tube, stop compressions, spray drug quickly down tube. Follow immediately with several quick insufflations and continue chest compressions.

StorageStore injection at controlled room temperature of 15°C to 30°C (59°F to 86°F); avoid freezing. In addition, AtroPen® should be protected from light.

Compatibility

Y-site administration: Compatible: Etomidate, famotidine, heparin, hydrocortisone sodium succinate, inamrinone, meropenem, nafcillin, potassium chloride, propofol, sufentanil, vitamin B complex with C. **Incompatible:** Thiopental.

Compatibility in syringe: Compatible: Butorphanol, chlorpromazine, cimetidine, dimenhydrinate, diphenhydramine, droperidol, fentanyl, glycopyrrolate, heparin, hydromorphone, hydroxyzine, hydroxyzine with meperidine, meperidine, meperidine with promethazine, metoclopramide, midazolam, milrinone, morphine, nalbuphine, ondansetron, pentazocine, perphenazine, prochlorperazine, promazine, promethazine, propiomazine, ranitidine, scopolamine, sufentanil. **Incompatible:** Cimetidine with pentobarbital. **Variable (consult detailed reference):** Pentobarbital.

Compatibility when admixed: Compatible: Dobutamine, furosemide, meropenem, sodium bicarbonate, verapamil. **Incompatible:** Floxacillin, metaraminol, methohexital, norepinephrine.

RestrictionsThe AtroPen® formulation is available for use primarily by the Department of Defense.

ContraindicationsHypersensitivity to atropine or any component of the formulation; narrow-angle glaucoma; adhesions between the iris and lens; tachycardia; obstructive GI disease; paralytic ileus; intestinal atony of the elderly or debilitated patient; severe ulcerative colitis; toxic megacolon complicating ulcerative colitis; hepatic disease; obstructive uropathy; renal disease; myasthenia gravis (unless used to treat side effects of acetylcholinesterase inhibitor); asthma; thyrotoxicosis; Mobitz type II block

Allergy Considerations

- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hyperthermia: In the presence of a high environmental temperature, heat prostration can occur.
- Psychosis: Can occur in sensitive individuals.

Disease-related concerns:

- Autonomic neuropathy: Use with caution in patients with autonomic neuropathy.
- Benign prostatic hyperplasia (BPH): Use with caution in patients with BPH.
- Cardiovascular disease: Use with caution in patients with myocardial ischemia, HF, tachyarrhythmias, and/or hypertension.
- Hiatal hernia: Use with caution in patients with hiatal hernia associated with reflux esophagitis.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.

Special populations:

- Elderly: Use with caution in the elderly; may be sensitive to side effects.
- Pediatrics: Use with caution in children with spastic paralysis.

Dosage form specific issues:

- AtroPen®: There are no absolute contraindications for the use of atropine in severe organophosphate poisonings, however in mild poisonings, use caution in those patients where the use of atropine would be otherwise contraindicated. Formulation for use by trained personnel only.

Geriatric ConsiderationsAnticholinergic agents are generally not well tolerated in the elderly and their use should be avoided when possible. In elderly, anticholinergic agents should not be used as prophylaxis against extrapyramidal symptoms.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Atropine has been found to cross the human placenta.

LactationEnters breast milk (trace amounts)/use caution (AAP rates "compatible")

Breast-Feeding ConsiderationsAnticholinergic agents may suppress lactation.

Adverse ReactionsSeverity and frequency of adverse reactions are dose related and vary greatly; listed reactions are limited to significant and/or life-threatening.

Cardiovascular: Arrhythmia, flushing, hypotension, palpitation, tachycardia

Central nervous system: Ataxia, coma, delirium, disorientation, dizziness, drowsiness, excitement, fever, hallucinations, headache, insomnia, nervousness

Dermatologic: Anhidrosis, urticaria, rash, scarlatiniform rash

Gastrointestinal: Bloating, constipation, delayed gastric emptying, loss of taste, nausea, paralytic ileus, vomiting, xerostomia, dry throat, nasal dryness

Genitourinary: Urinary hesitancy, urinary retention

Neuromuscular & skeletal: Weakness

Ocular: Angle-closure glaucoma, blurred vision, cycloplegia, dry eyes, mydriasis, ocular tension increased

Respiratory: Dyspnea, laryngospasm, pulmonary edema

Miscellaneous: Anaphylaxis

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Monitoring ParametersHeart rate, blood pressure, pulse, mental status; intravenous administration requires a cardiac monitor

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor for tachycardia, hypotension especially if cardiac problems are present. Be alert to the potential of heat prostration in the presence of high temperatures. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake oral forms exactly as directed, 30 minutes before meals. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Void before taking medication. You may experience dizziness, blurred vision, sensitivity to light (use caution when driving or engaging in tasks requiring alertness until response to drug is known); dry mouth, nausea, or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); orthostatic hypotension (use caution when climbing stairs and when rising from lying or sitting position); constipation (increased exercise, fluids, fruit, or fiber may help; if not effective, consult prescriber); increased sensitivity to heat and decreased perspiration (avoid extremes of heat, reduce exercise in hot weather); or decreased milk if breast-feeding. Report hot, dry, flushed skin; blurred vision or vision changes; difficulty swallowing; chest pain, palpitations, or rapid heartbeat; painful or difficult urination; increased confusion, depression, or loss of memory; rapid or difficult respirations; muscle weakness or tremors; or eye pain.

Ophthalmic: Instill as often as recommended. Wash hands before using. Sit or lie down, open eye, look at ceiling, and instill prescribed amount of solution. Do not blink for 30 seconds, close eye and roll eye in all directions, and apply gentle pressure to inner corner of eye for 1-2 minutes. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Temporary stinging or blurred vision may occur.

Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sulfate: 0.05 mg/mL (5 mL); 0.1 mg/mL (5 mL, 10 mL); 0.4 mg/0.5 mL (0.5 mL); 0.4 mg/mL (0.5 mL, 1 mL, 20 mL); 1 mg/mL (1 mL)

AtroPen®: 0.25 mg/0.3 mL (0.3 mL); 0.5 mg/0.7 mL (0.7 mL); 1 mg/0.7 mL (0.7 mL); 2 mg/0.7 mL (0.7 mL) [prefilled autoinjector]

Ointment, ophthalmic, as sulfate: 1% (3.5 g)

Solution, ophthalmic, as sulfate: 1% (2 mL, 5 mL, 15 mL)

Atropine-Care®: 1% (2 mL) [contains benzalkonium chloride]

Isopto® Atropine: 1% (5 mL, 15 mL) [contains benzalkonium chloride]

Tablet, as sulfate:

Sal-Tropine™: 0.4 mg

Generic AvailableYes: Excludes tablet

Pricing: U.S. (www.drugstore.com)

Ointment (Atropine Sulfate)

1% (3.5): $8.99

Solution (Atropine Sulfate)

0.4 mg/mL (200): $23.14

1% (5): $8.99

1% (15): $12.99

Solution (Atropine-Care)

1% (2): $7.99

Solution (Isopto Atropine)

1% (5): $24.13

1% (15): $31.45

Tablets (Sal-Tropine)

0.4 mg (30): $19.99

Mechanism of ActionBlocks the action of acetylcholine at parasympathetic sites in smooth muscle, secretory glands, and the CNS; increases cardiac output, dries secretions. Atropine reverses the muscarinic effects of cholinergic poisoning. The primary goal in cholinergic poisonings is reversal of bronchorrhea and bronchoconstriction. Atropine has no effect on the nicotinic receptors responsible for muscle weakness, fasciculations, and paralysis.

Pharmacodynamics/Kinetics

Onset of action: I.V.: Rapid

Absorption: Complete

Distribution: Widely throughout the body; crosses placenta; trace amounts enter breast milk; crosses blood-brain barrier

Metabolism: Hepatic

Half-life elimination: 2-3 hours

Excretion: Urine (30% to 50% as unchanged drug and metabolites)

Related Information

- Cycloplegic Mydriatics
- Pralidoxime

Dental Health Professional ConsiderationsThe possibility of the need for an initial dose in excess of 0.4 mg has been confirmed by the American Dental Association in its recommendation on the use of this medication to reduce salivation during dental procedures.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), dry throat, and nasal dryness

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusUse of injectable dosage form may cause ataxia, hallucinations, dizziness, amnesia, difficulty concentrating, agitation, delirium, paranoia, anxiety, and mania

Mental Health: Effects on Psychiatric TreatmentMay decrease the effects of phenothiazines; concurrent use with psychotropics may result in additive anticholinergic side effects (dry mouth, blurred vision, constipation)

Cardiovascular ConsiderationsAtropine, at usual recommended cardiovascular doses, causes blockade of muscarinic receptors at the cardiac SA-node and is parasympatholytic (ie, blocks vagal activity increasing heart rate). A dose 0.5-1 mg is recommended for the treatment of bradyarrhythmias. In administering atropine, it is important to recognize that lower doses (<0.5 mg) may have vagalmimetic effects (ie, increase vagal tone causing paradoxical bradycardia). It is likely that the vagal tonic effects of atropine are mediated by blockade of muscarinic receptors at the level of the brain. Thus, it is important that the recommended dose of atropine be administered by rapid intravenous injection. Slow injection may result in paradoxical bradycardia. Atropine is also recommended as part of the ACLS protocol. In this situation, in the absence of vascular access, atropine can be administered intratracheally. For intratracheal administration, the dosage must be diluted with normal saline to a total volume of 10 mL.

Atropine causes mydriasis which makes the pupils unable to be evaluated in a neurologic examination.

Anesthesia and Critical Care Concerns/Other ConsiderationsAtropine, at usual recommended cardiovascular doses, causes blockade of muscarinic receptors at the cardiac SA-node and is parasympatholytic (ie, blocks vagal activity increasing heart rate). A dose 0.5-1 mg is recommended for the treatment of bradyarrhythmias. In administering atropine, it is important to recognize that lower doses (<0.5 mg) may have vagalmimetic effects (ie, increase vagal tone causing paradoxical bradycardia). A total dose of 3 mg (0.04 mg/kg) results in full vagal blockade in humans. In the absence of vascular access, atropine can be administered intratracheally.

Index TermsAtropine Sulfate

Attapulgite

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Note: Attapulgite preparations have been discontinued in the U.S.; refer to Bismuth monograph for newly-reformulated Kaopectate® products.

Sound-alike/look-alike issues:

Kaopectate® may be confused with Kayexalate®

Pronunciation(at a PULL gite)

Canadian Brand NamesKaopectate® Children’s [OTC]; Kaopectate® Extra Strength [OTC]; Kaopectate® [OTC]

Pharmacologic CategoryAntidiarrheal

Use: Labeled IndicationsSymptomatic treatment of diarrhea and cramps

Dosing: Adults**Diarrhea:** Oral (give after each bowel movement): 1200-1500 mg/dose; maximum dose: 8400 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Diarrhea:** Oral (give after each bowel movement):

Children:

3-6 years: 300 mg/dose; maximum dose: 2100 mg/day

6-12 years: 600-750 mg/dose; maximum dose: 4500 mg/day

Children >12 years: Refer to adult dosing.

Administration: OralShake liquid well before administering. Do not administer within 2-3 hours of other medications.

RestrictionsNot available in the U.S.

ContraindicationsHypersensitivity to attapulgite or any component of the formulation

Warnings/PrecautionsConsult healthcare provider before initiating therapy if high fever or bloody stools are present. Do not use for >2 days. If diarrhea persists, consult healthcare provider. Dosage not established in children <3 years of age.

Geriatric ConsiderationsElderly often present bowel impaction with diarrhea. The use of adsorbents in the face of fecal impaction could aggravate this serious condition. Also, diarrhea causes fluid/electrolyte loss which elderly do not tolerate well. Use of adsorbents can cause further loss of fluid/electrolytes.

Drug InteractionsThere are no known significant interactions.

Monitoring Parameters

Signs of fluid and electrolyte loss

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Suspension, oral:

Kaopectate® [CAN]: 600 mg/15 mL (250 mL, 350 mL) [vanilla flavor] [not available in the U.S.]

Kaopectate® Children’s [CAN]: 600 mg/15 mL (180 mL) [cherry flavor] [not available in the U.S.]

Kaopectate® Extra Strength [CAN]: 750 mg/15 mL (250 mL, 350 mL) [peppermint flavor] [not available in the U.S.]

Mechanism of ActionNonselectively absorbs excess intestinal fluid, thereby reducing stool liquidity. May interfere with absorption of nutrients and other drugs as well.

Pharmacodynamics/KineticsAbsorption: Not absorbed

Related Information

- Bismuth

Pharmacotherapy PearlsAttapulgite has been removed from the U.S. market. The U.S. Food and Drug Administration (FDA) found controlled studies documenting the efficacy of attapulgite to be inadequate.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive GI effects (constipation)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Ridaura® may be confused with Cardura®

Pronunciation(au RANE oh fin)

U.S. Brand NamesRidaura®

Canadian Brand NamesRidaura®

Pharmacologic CategoryGold Compound

Use: Labeled IndicationsManagement of active stage of classic or definite rheumatoid arthritis in patients who do not respond to or tolerate other agents; psoriatic arthritis; adjunctive or alternative therapy for pemphigus

Dosing: AdultsRheumatoid arthritis, psoriatic arthritis, pemphigus: Oral: Initial: 6 mg/day in 1-2 divided doses; after 3 months may be increased to 9 mg/day in 3 divided doses; if still no response after 3 months at 9 mg/day, discontinue drug

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRheumatoid arthritis: Oral: Initial: 0.1 mg/kg/day divided daily; usual maintenance: 0.15 mg/kg/day in 1-2 divided doses; maximum: 0.2 mg/kg/day in 1-2 divided doses

Dosing: Renal Impairment

Cl_{cr} 50-80 mL/minute: Administer 50% of dose.

Cl_{cr} <50 mL/minute: Avoid use.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

StorageStore in tight, light-resistant containers at 15°C to 30°C.

ContraindicationsHypersensitivity to auranofin or any component of the formulation; renal disease, history of blood dyscrasias, congestive heart failure, exfoliative dermatitis, necrotizing enterocolitis, history of anaphylactic reactions

Allergy Considerations

- Gold Salt Allergy

Warnings/Precautions

Boxed warnings:

- Gold toxicity: **[U.S. Boxed Warning]: May be associated with significant toxicity involving dermatologic, gastrointestinal, hematologic, pulmonary, renal, and hepatic systems (see below); patient eduction is required.**

Concerns related to adverse effects:

- Dermatologic reactions: Dermatitis and lesions of the mucous membranes are common and may be serious; pruritus may precede the early development of a skin reaction. Consider alternative therapy in patients with dermatitis (urticaria or eczema; relative contraindication); may increase risk and/or symptoms of gold toxicity may be more difficult to detect.

- Gastrointestinal effects: Signs of toxicity include persistent diarrhea, stomatitis, and enterocolitis; avoid use in patients with prior inflammatory bowel disease.

- Hematologic effects: Signs of toxicity include hematologic depression (depressed hemoglobin, leukocytes, granulocytes, or platelets). Avoid use in patients with a history of blood dyscrasias (anemia, agranulocytosis), hemorrhagic diathesis, or drug induced granulocytopenia. Symptoms of gold toxicity may be difficult to detect in patients with prior abnormalities; consider alternative therapy. Therapy should be discontinued if platelet count falls to <100,000/mm^3, WBC <4000, granulocytes <1500/mm^3.

- Hepatic effects: May be associated with the development of cholestatic jaundice. Consider alternative therapy in patients with hepatic impairment (relative contraindication); may increase risk and/or symptoms of gold toxicity may be more difficult to detect.

- Pulmonary toxicity: May be associated with interstitial fibrosis; monitor closely.

- Renal effects: Renal toxicity ranges from mild proteinuria to nephrotic syndrome. Consider alternative therapy in patients with renal impairment; may increase risk and/or symptoms of gold toxicity may be more difficult to detect.

Concurrent drug therapy issues:

- ACE inhibitors: Concurrent use with ACE inhibitors may increase the risk of nitritoid reactions.

Other warnings/precautions:

- Monitoring: Laboratory monitoring should be completed prior to each new prescription. Frequent monitoring of patients for signs and symptoms of toxicity will prevent serious adverse reactions.

Geriatric ConsiderationsTolerance to gold decreases with advanced age; use cautiously only after traditional therapy and other disease modifying antirheumatic drugs (DMARDs) have been attempted.

Pregnancy Risk FactorC

LactationEnters breast milk/contraindicated

Adverse Reactions

>10%:

Dermatologic: Rash (24%), pruritus (17%)

Gastrointestinal: Diarrhea/loose stools (47%), abdominal pain (14%), stomatitis (13%)

Ocular: Conjunctivitis

Renal: Proteinuria

1% to 10%:

Dermatologic: Alopecia, urticaria

Gastrointestinal: Anorexia, constipation, dyspepsia, dysgeusia, flatulence, glossitis

Hematologic: Anemia, eosinophilia, leukopenia, thrombocytopenia

Hepatic: Transaminases increased

Renal: Hematuria, proteinuria

<1%: Agranulocytosis, angioedema, corneal deposits, dysphagia, enterocolitis (ulcerative), GI hemorrhage, gingivitis, gold bronchitis, hepatotoxicity, interstitial pneumonitis, jaundice, metallic taste, melena, neutropenia, pancytopenia, peripheral neuropathy, red cell aplasia. **Note:** Exfoliative dermatitis has been reported with other gold compounds.

Drug InteractionsThere are no known significant interactions.

Test InteractionsMay enhance the response to a tuberculin skin test

Monitoring ParametersPatients should have a CBC with differential, platelet count, hemoglobin determination and urinalysis for protein, white cells, red cells and casts; at baseline and periodically during therapy (at least monthly). Skin and oral mucosa should be inspected for skin rash, bruising or oral ulceration/stomatitis. Specific questioning for symptoms such as pruritus, rash, stomatitis or metallic taste should be included. Dosing should be withheld in patients with significant gastrointestinal, renal, dermatologic, or hematologic effects (platelet count falls to <100,000/mm^3, WBC <4000, granulocytes <1500/mm^3

Reference RangeGold: Normal: 0-0.1 mcg/mL (SI: 0-0.0064 µmol/L); Therapeutic: 1-3 mcg/mL (SI: 0.06-0.18 µmol/L); Urine: <0.1 mcg/24 hours

Monitoring: Lab TestsPatients should have a CBC with differential, platelet count, hemoglobin determination and urinalysis for protein, white cells, red cells and casts; at baseline and periodically during therapy (at least monthly). Dosing should be withheld in patients with significant gastrointestinal, renal, dermatologic, or hematologic effects (platelet count falls to <100,000/mm^3, WBC <4000, granulocytes <1500/mm^3

Monitor urine for protein, CBC and platelets; may monitor auranofin serum levels

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Ridaura®: 3 mg [29% gold]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Ridaura)

3 mg (60): $279.29

Mechanism of ActionThe exact mechanism of action of gold is unknown; gold is taken up by macrophages which results in inhibition of phagocytosis and lysosomal membrane stabilization; other actions observed are decreased serum rheumatoid factor and alterations in immunoglobulins. Additionally, complement activation is decreased, prostaglandin synthesis is inhibited, and lysosomal enzyme activity is decreased.

Pharmacodynamics/Kinetics

Onset of action: Delayed; therapeutic response may require as long as 3-4 months

Duration: Prolonged

Absorption: Oral: ~20% gold in dose is absorbed

Protein binding: 60%

Half-life elimination (single or multiple dose dependent): 21-31 days

Time to peak, serum: ~2 hours

Excretion: Urine (60% of absorbed gold); remainder in feces

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Glossitis and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay rarely produce agranulocytosis; use caution with clozapine and carbamazepine

Medication Safety Issues

Sound-alike/look-alike issues:

AzaCITIDine may be confused with azaTHIOprine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ay za SYE ti deen)

U.S. Brand NamesVidaza®

Pharmacologic CategoryAntineoplastic Agent, DNA Methylation Inhibitor

Use: Labeled IndicationsTreatment of myelodysplastic syndrome (MDS)

Use: Unlabeled/InvestigationalTreatment of acute myelogenous leukemia (AML)

Dosing: Adults

MDS: I.V., SubQ: 75 mg/m^2/day for 7 days repeated every 4 weeks. Dose may be increased to 100 mg/m^2/day if no benefit is observed after 2 cycles and no toxicity other than nausea and vomiting have occurred. Treatment is recommended for at least 4 cycles; treatment may be continued as long as patient continues to benefit.

AML (unlabeled use): SubQ: 75 mg/m2/day for 7 days repeated every 4 weeks (Sudan, 2006)

Dosage adjustment based on hematology: Adults: I.V., SubQ: MDS:

For baseline WBC ≥3.0 x 10^9/L, ANC ≥1.5 x 10^9/L, and platelets ≥75 x 10^9/L:

Nadir count: ANC <0.5 x 10^9/L or platelets <25 x 10^9/L: Administer 50% of dose during next treatment course

Nadir count: ANC 0.5-1.5 x 10^9/L or platelets 25-50 x 10^9/L: Administer 67% of dose during next treatment course

Nadir count: ANC >1.5 x 10^9/L or platelets >50 x 10^9/L: Administer 100% of dose during next treatment course

For baseline WBC <3 x 10^9/L, ANC <1.5 x 10^9/L, or platelets <75 x 10^9/L: Adjust dose as follows based on nadir counts and bone marrow biopsy cellularity at the time of nadir, unless clear improvement in differentiation at the time of the next cycle:

WBC or platelet nadir decreased 50% to 75% from baseline and bone marrow biopsy cellularity at time of nadir 30% to 60%: Administer 100% of dose during next treatment course

WBC or platelet nadir decreased 50% to 75% from baseline and bone marrow biopsy cellularity at time of nadir 15% to 30%: Administer 50% of dose during next treatment course

WBC or platelet nadir decreased 50% to 75% from baseline and bone marrow biopsy cellularity at time of nadir <15%: Administer 33% of dose during next treatment course

WBC or platelet nadir decreased >75% from baseline and bone marrow biopsy cellularity at time of nadir 30% to 60%: Administer 75% of dose during next treatment course

WBC or platelet nadir decreased >75% from baseline and bone marrow biopsy cellularity at time of nadir 15% to 30%: Administer 50% of dose during next treatment course

WBC or platelet nadir decreased >75% from baseline and bone marrow biopsy cellularity at time of nadir <15%: Administer 33% of dose during next treatment course

Note: If a nadir defined above occurs, administer the next treatment course 28 days after the start of the preceding course as long as WBC and platelet counts are >25% above the nadir and rising. If a >25% increase above the nadir is not seen by day 28, reassess counts every 7 days. If a 25% increase is not seen by day 42, administer 50% of the scheduled dose.

Dosage adjustment based on serum electrolytes: The manufacturer recommends that if serum bicarbonate falls to <20 mEq/L (unexplained decrease): Reduce dose by 50% for next treatment course

Dosing: ElderlyRefer to adult dosing. Due to the potential for decreased renal function in the elderly, select dose carefully and closely monitor renal function.

Dosing: Pediatric

Pediatric AML and ANLL (unlabeled uses): I.V.: 250 mg/m^2 days 4 and 5 every 4 weeks

Pediatric AML induction (unlabeled use): I.V.: 300 mg/m^2 days 5 and 6

Dosing: Renal ImpairmentNot studied in patients with renal impairment; select dose carefully (excretion is primarily renal; consider dose reduction); monitor closely for toxicity.

Dosing: Hepatic ImpairmentNot studied in patients with hepatic impairment; use caution. Contraindicated in patients with advanced malignant hepatic tumors.

Dosing: Adjustment for Toxicity**Renal toxicity:** If increases in BUN or serum creatinine (unexplained) occur, delay next cycle until values reach baseline or normal, then reduce dose by 50% for next treatment course.

Calculations

- ANC: Absolute Neutrophil Count
- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Premedication for nausea and vomiting is recommended. Infuse over 10-40 minutes; infusion must be completed within 1 hour of (vial) reconstitution.

Administration: OtherSubQ: Premedication for nausea and vomiting is recommended. The manufacturer recommends equally dividing volumes >4 mL into 2 syringes and injecting into 2 separate sites; however, policies for maximum SubQ administration volume may vary by institution; interpatient variations may also apply. Administer subsequent injections at least 1 inch from previous injection sites. Allow refrigerated suspensions to come to room temperature (up to 30 minutes) prior to administration. Resuspend by inverting the syringe 2-3 times and then rolling the syringe between the palms for 30 seconds. If azacitidine suspension comes in contact with the skin, immediately wash with soap and water.

StoragePrior to reconstitution, store powder at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

SubQ: Following reconstitution, suspension may be stored at room temperature for up to 1 hour, or immediately refrigerated at 2°C to 8°C (36°F to 46°F) and stored for up to 8 hours.

I.V.: **Solutions for I.V. administration have very limited stability and must be prepared immediately prior to each dose.** Administration must be completed within 1 hour of (vial) reconstitution.

ReconstitutionUse appropriate precautions for handling and disposal.

SubQ: To prepare a 25 mg/mL suspension, slowly add 4 mL SWFI to each vial. Vigorously shake or roll vial until a suspension is formed (suspension will be cloudy).

I.V.: Reconstitute vial with 10 mL SWFI to form a 10 mg/mL solution; vigorously shake until solution is dissolved and clear. Mix in 50-100 mL of NS or lactated Ringer's injection for infusion.

CompatibilityStable in LR, NS

Compatibility when admixed: Incompatible with D_5W, hetastarch, or solutions containing bicarbonate

ContraindicationsHypersensitivity to azacitidine, mannitol, or any component of the formulation; advanced malignant hepatic tumors

Allergy Considerations

- Mannitol Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Neutropenia, thrombocytopenia, and anemia are common; may cause therapy delays and/or dosage reductions.

- Hepatotoxicity: May be hepatotoxic, progressive hepatic coma leading to death has been reported (rare) in patients with extensive tumor burden, especially those with a baseline albumin <30 g/L.

- Renal toxicities: Serum creatinine elevations, renal tubular acidosis, and renal failure have been reported with combination chemotherapy; decrease or withhold dose for unexplained elevations in BUN or serum creatinine, or reductions in serum bicarbonate to <20 mEq/L.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment. Patients with hepatic impairment were excluded from clinical studies. Use is contraindicated in patients with advanced malignant hepatic tumors.

- Renal impairment: Use with caution in patients with renal impairment; dose adjustment may be required. Patients with renal impairment were excluded from clinical studies.

Special populations:

- Pediatrics: Not FDA approved for use in children.

Pregnancy Risk FactorD

Pregnancy ConsiderationsEmbryotoxicity, fetal death, and fetal abnormalities were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to avoid pregnancy during treatment. In addition, males should be advised to avoid fathering a child while on azacitidine therapy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

>10%:

Cardiovascular: Peripheral edema (7% to 19%), chest pain (16%), pallor (16%), pitting edema (15%)

Central nervous system: Fever (30% to 52%), fatigue (13% to 36%), headache (22%), dizziness (19%), anxiety (5% to 13%), depression (12%), insomnia (9% to 11%), malaise (11%), pain (11%)

Dermatologic: Bruising (19% to 31%), petechiae (11% to 24%), erythema (7% to 17%), skin lesion (15%), rash (10% to 14%), pruritus (12%)

Endocrine & metabolic: Hypokalemia (6% to 13%)

Gastrointestinal: Nausea (48% to 71%), vomiting (27% to 54%), diarrhea (36%), constipation (34% to 50%), anorexia (13% to 21%), weight loss (16%), abdominal pain (11% to 16%), abdominal tenderness (12%)

Hematologic: Thrombocytopenia (66% to 70%; grades 3/4: 58%), anemia (51% to 70%; grades 3/4: 14%), neutropenia (32% to 66%; grades 3/4: 61%), leukopenia (18% to 48%; grades 3/4: 15%), febrile neutropenia (14% to 16%; grades 3/4: 13%), myelosuppression (nadir: days 10-17; recovery: days 28-31)

Local: Injection site reactions (14% to 29%): Erythema (35% to 43%; more common with I.V. administration), pain (19% to 23%; more common with I.V. administration), bruising (5% to 14%)

Neuromuscular & skeletal: Weakness (29%), rigors (26%), arthralgia (22%), limb pain (20%), back pain (19%), myalgia (16%)

Respiratory: Cough (11% to 30%), dyspnea (5% to 29%), pharyngitis (20%), epistaxis (16%), nasopharyngitis (15%), upper respiratory tract infection (9% to 13%), pneumonia (11%), crackles (11%)

Miscellaneous: Diaphoresis (11%)

5% to 10%:

Cardiovascular: Cardiac murmur (10%), hypertension (≤9%), tachycardia (9%), hypotension (7%), syncope (6%), chest wall pain (5%)

Central nervous system: Lethargy (7% to 8%), hypoesthesia (5%), postprocedural pain (5%)

Dermatologic: Cellulitis (8%), urticaria (6%), dry skin (5%), skin nodule (5%)

Gastrointestinal: Gingival bleeding (10%), oral mucosal petechiae (8%), stomatitis (8%), weight loss (≤8%), dyspepsia (6% to 7%), hemorrhoids (7%), abdominal distension (6%), loose stools (6%), dysphagia (5%), oral hemorrhage (5%), tongue ulceration (5%)

Genitourinary: Dysuria (8%), urinary tract infection (8% to 9%)

Hematologic: Hematoma (9%), postprocedural hemorrhage (6%)

Local: Injection site reactions: Pruritus (7%), hematoma (6%), rash (6%), granuloma (5%), induration (5%), pigmentation change (5%), swelling (5%)

Neuromuscular & skeletal: Muscle cramps (6%)

Renal: Hematuria (≤6%)

Respiratory: Rhinorrhea (10%), rales (9%), wheezing (9%), breath sounds decreased (8%), pharyngolaryngeal pain (6%), pleural effusion (6%), postnasal drip (6%), rhinitis (6%), rhonchi (6%), nasal congestion (6%), atelectasis (5%), sinusitis (5%)

Miscellaneous: Lymphadenopathy (10%), herpes simplex (9%), night sweats (9%), transfusion reaction (7%), mouth hemorrhage (5%)

<5%, postmarketing, and/or case reports (limited to important or life-threatening): Abscess (limb), agranulocytosis, anaphylactic shock, atrial fibrillation, azotemia, blastomycosis, bone marrow depression/failure, bone pain aggravated, cardiac failure, cardiorespiratory arrest, catheter site hemorrhage, cellulitis, cerebral hemorrhage, CHF, cholecystectomy, cholecystitis, congestive cardiomyopathy, dehydration, diverticulitis, eye hemorrhage, fibrosis (interstitial and alveolar), gastrointestinal hemorrhage, glycosuria, hemoptysis, hepatic coma, hypersensitivity reaction, hypophosphatemia, infection (bacterial), injection site infection, intracranial hemorrhage, leukemia cutis, lung infiltration, melena, neutropenic sepsis, orthostatic hypotension, pancytopenia, pneumonitis, polyuria, pyoderma gangrenosum, renal failure, renal tubular acidosis, seizure, respiratory distress, sepsis, septic shock, serum bicarbonate levels decreased, serum creatinine increased, splenomegaly, systemic inflammatory response syndrome, toxoplasmosis

Oncology: VesicantNo. Subcutaneous injection of undissolved crystals may cause localized reactions.

Oncology: Emetic PotentialModerate (30% to 60%)

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop.

Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersLiver function tests, electrolytes, CBC with differential and platelets, renal function tests (BUN and serum creatinine) should be obtained prior to initiation of therapy. Electrolytes, renal function (BUN and creatinine), CBC should be monitored prior to each cycle and periodically as needed to monitor response and toxicity.

Nursing: Physical Assessment/MonitoringUse with caution in presence of hepatic or renal impairment (dose adjustment may be required). Pretreatment with antiemetic is recommended to reduce nausea and vomiting. Note specific administration, reconstitution, and storage instructions (I.V. and SubQ stability differs). Assess results of laboratory tests prior to beginning therapy and prior to each cycle. Patient should be monitored closely for adverse effects (eg, edema, chest pain, hypotension, CNS changes, gastrointestinal disturbances, hematologic, hepatic effects). Teach patient (or caregiver) possible side effects/appropriate intervention and adverse symptoms to report.

Monitoring: Lab TestsLiver function tests, electrolytes, CBC with differential and platelets, renal function tests (BUN and serum creatinine) should be obtained prior to initiation of therapy. Electrolytes, renal function (BUN and creatinine), CBC should be monitored prior to each cycle and periodically as needed to monitor response and toxicity.

Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. This medication can only be administered by injection or I.V.; report immediately any pain, burning, or swelling at injection/infusion site. Limit oral intake for 4-6 hours before therapy to reduce potential for nausea/vomiting. It is important that you maintain adequate nutrition between treatments (small, frequent meals may help) and adequate hydration (2-3 L/day of fluids), unless advised by prescriber to restrict fluids. You may be susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea, vomiting, abdominal tenderness, or anorexia (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help - if nausea/vomiting are severe, request antiemetic); mouth sores (use soft toothbrush or cotton swabs for mouth care); or loss of hair (reversible). Report chest pain or palpitations; sore throat, fever, chills, unusual weakness or fatigue; unusual bruising/bleeding; change in color or frequency of urine or stool; itching or burning on urination; difficulty breathing; change in visual acuity; pain, redness, or swelling at injection site; or any other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant or cause a pregnancy (males) during therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for suspension [preservative free]:

Vidaza®: 100 mg [contains mannitol 100 mg]

Generic AvailableNo

Mechanism of ActionAntineoplastic effects may be a result of azacitidine's ability to promote hypomethylation of DNA leading to direct toxicity of abnormal hematopoietic cells in the bone marrow.

Pharmacodynamics/Kinetics

Absorption: SubQ: Rapid and complete

Distribution: V_d: I.V.: 76 ± 26 L; does not cross blood-brain barrier

Metabolism: Hepatic; hydrolysis to several metabolites

Bioavailability: SubQ: ~89%

Half-life elimination: I.V., SubQ: ~4 hours

Time to peak, plasma: SubQ: 30 minutes

Excretion: Urine (50% to 85%); feces (minor)

AzaTHIOprine

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

AzaTHIOprine may be confused with azaCITIDine, azatadine, azidothymidine, azithromycin, Azulfidine®

Imuran® may be confused with Elmiron®, Enduron®, Imdur®, Inderal®, Tenormin®

Azathioprine is metabolized to mercaptopurine; concurrent use of these commercially-available products has resulted in profound myelosuppression.

Pronunciation(ay za THYE oh preen)

U.S. Brand NamesAzasan®; Imuran®

Canadian Brand NamesAlti-Azathioprine; Apo-Azathioprine®; Gen-Azathioprine; Imuran®; Novo-Azathioprine

Pharmacologic CategoryImmunosuppressant Agent

Use: Labeled IndicationsAdjunctive therapy in prevention of rejection of kidney transplants; management of active rheumatoid arthritis (RA)

Use: Unlabeled/InvestigationalAdjunct in prevention of rejection of solid organ (nonrenal) transplants; steroid-sparing agent for corticosteroid-dependent Crohn's disease (CD) and ulcerative colitis (UC); maintenance of remission in CD; fistulizing Crohn's disease

Use: DentalAdjunct with prednisone for managing severe erosive lichen planus, major aphthous stomatitis, erythema multiforme, and benign mucous membrane pemphigoid

Dosing: Adults**Note:** Patients with intermediate TPMT activity may be at risk for increased myelosuppression; those with low or absent TPMT activity receiving conventional azathioprine doses are at risk for developing severe, life-threatening myelotoxicity. Dosage reductions are recommended for patients with reduced TPMT activity.

I.V. dose is equivalent to oral dose (dosing should be transitioned from I.V. to oral as soon as tolerated):

Renal transplantation (treatment usually started the day of transplant, however, has been initiated [rarely] 1-3 days prior to transplant): Oral, I.V.: Initial: 3-5 mg/kg/day usually given as a single daily dose, then 1-3 mg/kg/day maintenance

Rheumatoid arthritis: Oral:

Initial: 1 mg/kg/day given once daily or divided twice daily, for 6-8 weeks; increase by 0.5 mg/kg every 4 weeks until response or up to 2.5 mg/kg/day; an adequate trial should be a minimum of 12 weeks

Maintenance dose: Reduce dose by 0.5 mg/kg every 4 weeks until lowest effective dose is reached; optimum duration of therapy not specified; may be discontinued abruptly

Adjunctive management of severe recurrent aphthous stomatitis (unlabeled use): Oral: 50 mg once daily in conjunction with prednisone

Reduction of steroid use in CD or UC, maintenance of remission in CD or fistulizing disease (unlabeled uses): Oral: Initial: 50 mg once daily; may increase by 25 mg/day every 1-2 weeks as tolerated to target dose of 2-3 mg/kg/day

Dosage adjustment for concomitant use with allopurinol: Reduce azathioprine dose to one-third or one-fourth the usual dose when used concurrently with allopurinol. Patients with low or absent TPMT activity may require further dose reductions or discontinuation.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Patients with intermediate TPMT activity may be at risk for increased myelosuppression; those with low or absent TPMT activity receiving conventional azathioprine doses are at risk for developing severe, life-threatening myelotoxicity. Dosage reductions are recommended for patients with reduced TPMT activity.

Renal transplantation, rheumatoid arthritis (unlabeled uses): Refer to adult dosing.

Dosing: Renal ImpairmentAlthough dosage reductions are recommended, specific guidelines are not available in the FDA-approved labeling; the following guidelines have been used by some clinicians (Aronoff, 2007):

Cl_{cr} >50 mL/minute: No adjustment recommended.

Cl_{cr} 10-50 mL/minute: Administer 75% of normal dose.

Cl_{cr} <10 mL/minute: Administer 50% of normal dose.

Hemodialysis (dialyzable; ~45% removed in 8 hours): Children: Administer 50% of normal dose; Adults: Supplement: 0.25 mg/kg

CAPD: Children: Administer 50% of normal dose; Adults: Unknown

CRRT: Children and Adults: Administer 75% of normal dose

Dosing: Adjustment for Toxicity

Rapid WBC count decrease, persistently low WBC count, or serious infection: Reduce dose or temporarily withhold treatment.

Severe toxicity in renal transplantation: May require discontinuation.

Hepatic veno-occlusive disease: Permanently discontinue.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Ideal Body Weight: Adults
- Ideal Body Weight: Pediatrics

Administration: I.V.Can be administered IVP over 5 minutes at a concentration not to exceed 10 mg/mL **or** azathioprine can be further diluted with normal saline or D_5W and administered by intermittent infusion usually over 30-60 minutes; may be extended up to 8 hours.

Administration: I.V. DetailpH: 9.6

Administration: OralAdministering tablets after meals or in divided doses may decrease adverse GI events.

Dietary ConsiderationsMay be taken with food.

Storage

Tablet: Store at room temperature of 15°C to 25°C (59°F to 77°F); protect from light.

Powder for injection: Store intact vials at room temperature of 15°C to 25°C (59°F to 77°F). Protect from light. Reconstituted solution is stable for up to 2 weeks at room temperature or up to 4 days refrigerated; solutions diluted in D_5W, $^1/_2$NS, or NS for infusion are stable at room temperature or refrigerated for up to 16 days; however, the manufacturer recommends use within 24 hours of reconstitution.

ReconstitutionPowder for injection: Reconstitute each vial with 10 mL sterile water for injection; may further dilute for infusion (in D_5W, $^1/_2$NS, or NS). Use appropriate precautions for handling and disposal.

CompatibilityStable in D_5W, $^1/_2$NS, NS. Stable in neutral or acid solutions, but is hydrolyzed to mercaptopurine in alkaline solutions.

Extemporaneously PreparedA 50 mg/mL oral suspension can be prepared by crushing one hundred twenty (120) 50 mg tablets in a mortar (reducing to a fine powder), and then mixing in a small amount of vehicle (a 1:1 combination of Ora-Sweet® or Ora-Sweet® SF and Ora-Plus®) to create a uniform paste. Continue to add vehicle in geometric amounts (while mixing) until near-final volume is achieved. Transfer to a graduate and add sufficient quantity to make 120 mL. Label "shake well" and "refrigerate." Refrigerated stability is 60 days.

Allen LV Jr and Erickson MA III, "Stability of Acetazolamide, Allopurinol, Azathioprine, Clonazepam, and Flucytosine in Extemporaneously Compounded Oral Liquids," *Am J Health Syst Pharm*, 1996, 53(16):1944-9.

Nahata MC, Morosco RS, and Hipple TF, 4th ed, *Pediatric Drug Formulations*, Cincinnati, OH: Harvey Whitney Books Co, 2000.

ContraindicationsHypersensitivity to azathioprine or any component of the formulation; pregnancy (in patients with rheumatoid arthritis); patients with rheumatoid arthritis and a history of treatment with alkylating agents (eg, cyclophosphamide, chlorambucil, melphalan) may have a prohibitive risk of neoplasia with azathioprine treatment

Allergy Considerations

- AzaTHIOprine Allergy

Warnings/Precautions

Boxed warnings:

- Experienced physician: See "Other warnings/precautions" below.
- Neoplasia: See "Concerns related to adverse effects" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Gastrointestinal toxicity: Within the first several weeks of therapy gastrointestinal toxicity (reversible) may occur; symptoms may include severe nausea, vomiting, diarrhea, rash, fever, malaise, myalgia, hypotension, and liver enzyme abnormalities.
- Hematologic toxicity: Dose-related, delayed hematologic toxicities (leukopenia, thrombocytopenia, macrocytic anemia, pancytopenia) may occur; may be more severe with renal transplants undergoing rejection and patients with thiopurine methyltransferase (TPMT) deficiency; monitor hematologic function closely. May require dosage modification.
- Hepatotoxicity: Hepatotoxicity (transaminase, bilirubin, and alkaline phosphatase elevations) may occur, usually in renal transplant patients. Usually occurs within 6 months of transplant and is normally reversible with discontinuation. Monitor liver function periodically. Rarely, hepatic veno-occlusive disease (VOD) has been reported; discontinue if hepatic VOD is suspected.
- Infections: Chronic immunosuppression increases the risk of serious infections.
- Neoplasia: **[U.S. Boxed Warning]: Chronic immunosuppression increases the risk of neoplasia;** azathioprine has mutagenic potential to both men and women.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment; dosage reductions may be necessary.
- TPMT deficiency: Patients with genetic deficiency of TPMT may be sensitive to myelosuppressive effects. Patients with intermediate TPMT activity may be at risk for increased myelosuppression; those with low or absent TPMT activity are at risk for developing severe and life-threatening hematologic toxicity. TPMT genotyping or phenotyping may assist in identifying patients at risk for developing toxicity. TPMT testing does not substitute for CBC monitoring.

Concurrent drug therapy issues:

- Mercaptopurine: Azathioprine is metabolized to mercaptopurine; concomitant use may result in profound myelosuppression and should be avoided.
- TPMT or xanthine oxidase inhibitors: Patients on concurrent therapy with drugs which may inhibit TPMT (eg, olsalazine) or xanthine oxidase (eg, allopurinol) may be sensitive to myelosuppressive effects. Dose adjustment of azathioprine may be recommended when used concurrently with allopurinol; patients with low or absent TPMT activity may require further dose reductions or discontinuation.
- Vaccines: Immune response to vaccines may be diminished.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be prescribed by physicians familiar with the risks, including hematologic toxicities and mutagenic potential.**

Geriatric ConsiderationsToxicity to immunosuppressives is increased in elderly. Start with lowest recommended adult doses. Signs of infection, such as fever and WBC rise, may not occur. Lethargy and confusion may be more prominent signs of infection. In the elderly, adjust dose to creatinine clearance.
Pregnancy Risk FactorD
Pregnancy ConsiderationsAzathioprine was found to be teratogenic in animal studies; temporary depression in spermatogenesis and reduction in sperm viability and sperm count were also reported in mice. Azathioprine crosses the placenta in humans; congenital anomalies, immunosuppression, hematologic toxicities (lymphopenia, pancytopenia), and intrauterine growth retardation have been reported. There are no adequate and well-controlled studies in pregnant women. Azathioprine should not be used to treat arthritis during pregnancy. The potential benefit to the mother versus possible risk to the fetus should be considered when treating other disease states.

The National Transplantation Pregnancy Registry (NTPR, Temple University) is a registry for pregnant women taking immunosuppressants following any solid organ transplant. The NTPR encourages reporting of all immunosuppressant exposures during pregnancy in transplant recipients at 877-955-6877.

LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsDue to risk of immunosuppression and serious adverse effects in the nursing infant, breast-feeding is not recommended.
Adverse ReactionsFrequency not always defined; dependent upon dose, duration, indication, and concomitant therapy. Central nervous system: Fever, malaiseGastrointestinal: Nausea/vomiting (RA: 12%), diarrheaHematologic: Leukopenia (renal transplant: >50%; RA: 28%), thrombocytopeniaHepatic: Alkaline phosphatase increased, bilirubin increased, hepatotoxicity, transaminases increasedNeuromuscular & skeletal: MyalgiaMiscellaneous: Infection (renal transplant: 20%; RA: <1%; includes bacterial, fungal, protozoal, viral), neoplasia (other than lymphoma: 3%)<1%, postmarketing, and/or case reports: Abdominal pain, alopecia, arthralgia, bleeding, bone marrow suppression, fever, hepatic veno-occlusive disease, hepatosplenic T-cell lymphoma, hypersensitivity, hypotension, interstitial pneumonitis, lymphoma, macrocytic anemia, negative nitrogen balance, pancreatitis, pancytopenia, rash, steatorrhea
Drug Interactions

5-ASA Derivatives: May decrease the metabolism of Thiopurine Analogs. *Risk C: Monitor therapy*

ACE Inhibitors: May enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Allopurinol: May decrease the metabolism of AzaTHIOprine. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Mercaptopurine: AzaTHIOprine may enhance the myelosuppressive effect of Mercaptopurine. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Sulfamethoxazole: May enhance the myelosuppressive effect of AzaTHIOprine. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Trimethoprim: May enhance the myelosuppressive effect of AzaTHIOprine. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): AzaTHIOprine may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid cat's claw, echinacea (have immunostimulant properties).

Test InteractionsTPMT phenotyping results will not be accurate following recent blood transfusions.

Monitoring ParametersCBC with differential and platelets (weekly during first month, twice monthly for months 2 and 3, then monthly; monitor more frequently with dosage modifications), total bilirubin, liver function tests, TPMT genotyping or phenotyping

For use as immunomodulatory therapy in CD or UC, monitor CBC with differential weekly for 1 month, then biweekly for 1 month, followed by monitoring every 1-2 months throughout the course of therapy. LFTs should be assessed every 3 months.

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess results of laboratory tests, therapeutic effectiveness (according to purpose for use) and adverse reactions at beginning of therapy and periodically throughout therapy, especially opportunistic infection. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelets (weekly during first month, twice monthly for months 2 and 3, then monthly; monitor more frequently with dosage modifications), total bilirubin, liver function tests, TPMT genotyping or phenotyping

For use as immunomodulatory therapy in CD or UC, monitor CBC with differential weekly for 1 month, then biweekly for 1 month, followed by monitoring every 1-2 months throughout the course of therapy. LFT's should be assessed every 3 months.

Patient EducationTake as prescribed (may take in divided doses or with food if GI upset occurs). You will be susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations unless approved by prescriber). You may experience nausea, vomiting, loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report abdominal pain and unresolved GI upset (eg, persistent vomiting or diarrhea); unusual fever or chills; bleeding or bruising; sore throat, unhealed sores, or signs of infection; yellowing of skin or eyes; or change in color of urine or stool.

Rheumatoid arthritis: Response may not occur for up to 3 months; do not discontinue medication without consulting prescriber.

Organ transplant: Azathioprine will usually be prescribed with other antirejection medications.

Pregnancy/breast-feeding precautions: Do not get pregnant while taking this medication; use appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 100 mg

Tablet [scored]: 50 mg

Azasan®: 75 mg, 100 mg

Imuran®: 50 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Azasan)

75 mg (30): $87.27

100 mg (30): $106.45

Tablets (Azathioprine)

50 mg (30): $27.99

Tablets (Imuran)

50 mg (30): $101.49

Mechanism of ActionAzathioprine is an imidazolyl derivative of mercaptopurine; antagonizes purine metabolism and may inhibit synthesis of DNA, RNA, and proteins; may also interfere with cellular metabolism and inhibit mitosis. The 6-thioguanine nucleotides appear to mediate the majority of azathioprine's immunosuppressive and toxic effects.

Pharmacodynamics/Kinetics

Absorption: Oral: Well absorbed

Distribution: Crosses placenta

Protein binding: ~30%

Metabolism: Hepatic, to 6-mercaptopurine (6-MP), possibly by glutathione S-transferase (GST). Further metabolism of 6-MP (in the liver and GI tract), via three major pathways: Hypoxanthine guanine phosphoribosyltransferase (to 6-thioguanine-nucleotides, or 6-TGN), xanthine oxidase (to 6-thiouric acid), and thiopurine methyltransferase (TPMT), which forms 6-methylmercapotpurine (6-MMP).

Half-life elimination: Parent drug: 12 minutes; mercaptopurine: 0.7-3 hours; End-stage renal disease: Slightly prolonged

Time to peak, plasma: 1-2 hours (including metabolites)

Excretion: Urine (primarily as metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay produce pancytopenia; use caution with clozapine and carbamazepine

Index TermsAzathioprine Sodium

Azelaic Acid

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(a zeh LAY ik AS id)
U.S. Brand NamesAzelex®; Finacea®
Canadian Brand NamesFinacea®
Pharmacologic CategoryTopical Skin Product, Acne
Use: Labeled IndicationsTopical treatment of inflammatory papules and pustules of mild-to-moderate rosacea; mild-to-moderate inflammatory acne vulgaris

Finacea®: Not FDA-approved for the treatment of acne

Dosing: Adults

Acne vulgaris: Topical: Cream 20%: After skin is thoroughly washed and patted dry, gently but thoroughly massage a thin film of azelaic acid cream into the affected areas twice daily, in the morning and evening. The duration of use can vary and depends on the severity of the acne. In the majority of patients with inflammatory lesions, improvement of the condition occurs within 4 weeks.

Rosacea: Topical: Gel 15%: Massage gently into affected areas of the face twice daily; use beyond 12 weeks has not been studied

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricAcne vulgaris: Adolescents ≥12 years: Refer to adult dosing.
Administration: TopicalApply to clean, dry skin; wash hands following application. Avoid the use of occlusive dressings or wrappings. For gel formulation, cosmetics may be applied after the gel has dried. Not to be used orally, intravaginally, or for the eyes.
Dietary Considerations

Gel: Foods and beverages that might provoke erythema, flushing, and blushing, such as spicy food, alcoholic beverages, and thermally hot drinks (including hot coffee and tea), should be avoided.

StorageStore between 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to azelaic acid or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Hypopigmentation: There have been isolated reports of hypopigmentation after use.

- Skin irritation: If sensitivity or severe irritation develops, discontinue treatment and institute appropriate therapy.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Dosage form specific issues:

- Gel: Use of gel beyond 12 weeks has not been studied.

Other warnings/precautions:

- Appropriate use: For external use only; not for ophthalmic or vaginal use. Use of occlusive dressings or wrappings should be avoided.

Pregnancy Risk FactorB
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsSince <4% of a topically applied dose is systemically absorbed, the uptake of azelaic acid into breast milk is not expected to cause a significant change from baseline azelaic acid levels in the milk. However, exercise caution when administering to a nursing mother.
Adverse Reactions

>5%: Dermatologic: Pruritus (1% to 6%), burning/stinging/itching (1% to 6%)

1% to 5%:

Dermatologic: Acne (<1% to 1%), edema, erythema, rash, peeling, dermatitis, contact dermatitis, irritation, scaling/dry skin/xerosis

Neuromuscular & skeletal: Paresthesia

Postmarketing and/or case reports: Asthma exacerbation, herpes labialis exacerbation, hypertrichosis, reddening, small depigmented spots, vitiligo depigmentation

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringAssess therapeutic effectiveness and adverse response (sensitivity, severe irritation, or hypopigmentation in dark skinned patients) at regular intervals during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis medication is for application to affected skin areas only; as per directions of prescriber. Use for full prescribed treatment period. Do not apply any other skin products without consulting prescriber; especially avoid alcoholic cleansers, tinctures, and astringents; abrasives and peeling agents. Temporary skin irritation (eg pruritus, burning, stinging) may occur when applied to broken or inflamed skin, usually at start of treatment. If irritation continues, apply only once a day or stop treatment until these effects have subsided. If irritation reoccurs with further use, discontinue and consult prescriber. If you have dark skin, report immediately any complexion changes or loss of color. **Breast-feeding precaution:** Consult prescriber if you are breast-feeding.

Application: Apply with gloves and wash hands following application. Do not allow medication to come into contact with eyes, mouth, or mucous membranes (if it does come into contact with eyes, wash with large amount of water and consult prescriber if eye irritation persists). Apply nonirritating cosmetics after gel has dried.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream:

Azelex®: 20% (30 g, 50 g) [contains benzoic acid and propylene glycol]

Gel:

Finacea®: 15% (50 g) [contains benzoic acid and propylene glycol]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Cream (Azelex)

20% (30): $107.64

20% (50): $139.89

Gel (Finacea)

15% (50): $126.21

Mechanism of ActionAzelaic acid is a dietary constituent normally found in whole grain cereals; can be formed endogenously. Exact mechanism is not known. *In vitro*, azelaic acid possesses antimicrobial activity against *Propionibacterium acnes* and *Staphylococcus epidermidis*. May decrease microcomedo formation.

Pharmacodynamics/Kinetics

Absorption: Cream: ~3% to 5% penetrates stratum corneum; up to 10% found in epidermis and dermis; 4% systemic

Half-life elimination: Topical: Healthy subjects: 12 hours

Excretion: Urine (as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Optivar® may be confused with Optiray®, Optive™

International issues:

Optivar® may be confused with Opthavir® which is a brand name for acyclovir in Mexico

Pronunciation(a ZEL as teen)

U.S. Brand NamesAstelin®; Optivar®

Canadian Brand NamesAstelin®

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation

Use: Labeled Indications

Nasal spray: Treatment of the symptoms of seasonal allergic rhinitis such as rhinorrhea, sneezing, and nasal pruritus in children ≥5 years of age and adults; treatment of the symptoms of vasomotor rhinitis in children ≥12 years of age and adults

Ophthalmic: Treatment of itching of the eye associated with seasonal allergic conjunctivitis in children ≥3 years of age and adults

Dosing: Adults

Seasonal allergic rhinitis: Intranasal: 1-2 sprays each nostril twice daily

Vasomotor rhinitis: Intranasal: 2 sprays each nostril twice daily.

Seasonal allergic conjunctivitis: Ophthalmic: Instill 1 drop into affected eye(s) twice daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Seasonal allergic rhinitis: Intranasal:

5-11 years: 1 spray each nostril twice daily

≥12 years: Refer to adult dosing.

Vasomotor rhinitis: Intranasal: Children ≥12 years: Refer to adult dosing.

Seasonal allergic conjunctivitis: Ophthalmic: Children ≥3 years: Refer to adult dosing.

Administration: InhalationBefore initial use of the nasal spray, the delivery system should be primed with 4 sprays or until a fine mist appears. If 3 or more days have elapsed since last use, the delivery system should be reprimed with 2 sprays or until a fine mist appears. Blow nose to clear nostrils. Keep head tilted downward when spraying. Insert applicator into nostril, keeping bottle upright, and close off the other nostril. Breathe in through nose. While inhaling, press pump to release spray. Alternate sprays between nostrils. After each use, wipe the spray tip with a clean tissue or cloth.

Storage

Nasal spray: Store upright at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from freezing.

Ophthalmic solution: Store upright at controlled room temperature of 2°C to 25°C (36°F to 77°F).

ContraindicationsHypersensitivity to azelastine or any component of the formulation

Warnings/Precautions

Dosage form specific issues:

- Nasal spray: May cause drowsiness in some patients; instruct patient to use caution when driving or operating machinery. Effects may be additive with CNS depressants and/or ethanol. Safety and efficacy have not been established in children <5 years of age.
- Ophthalmic: Solution contains benzalkonium chloride; remove lens prior to administration and wait at least 10 minutes before reinserting. Do not use contact lenses if eyes are red. Safety and efficacy have not been established in children <3 years of age.

Geriatric ConsiderationsOnly a small number of older subjects were included in premarketing trials. In those patients, side effects were no different than in younger patients.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Animal reproduction studies have shown toxic effects to the fetus at maternally toxic doses. Use during pregnancy only if the potential benefit to the mother outweighs the possible risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

Nasal spray:

>10%:

Central nervous system: Headache (8% to 15%), somnolence (<1% to 12%)

Gastrointestinal: Bitter taste (8% to 20%)

Respiratory: Cold symptoms/rhinitis (2% to 17%), cough (11%)

2% to 10%:

Central nervous system: Dysesthesia (8%), dizziness (2%), fatigue (2%)

Gastrointestinal: Nausea (3%), weight gain (2%), xerostomia (3%)

Neuromuscular & skeletal: Myalgia (≤2%)

Ocular: Conjunctivitis (<2% to 5%)

Respiratory: Asthma (5%), nasal burning (4%), pharyngitis (4%), paroxysmal sneezing (3%), sinusitis (3%), epistaxis (2% to 3%)

<2%:

Cardiovascular: Flushing, hypertension, tachycardia

Central nervous system: Abnormal thinking, anxiety, depersonalization, depression, drowsiness, fever, hypoesthesia, malaise, nervousness, sleep disorder, vertigo

Dermatologic: Contact dermatitis, eczema, furunculosis, hair and follicle infection, skin laceration

Endocrine & metabolic: Amenorrhea, breast pain

Gastrointestinal: Abdominal pain, aphthous stomatitis, appetite increased, constipation, diarrhea, gastroenteritis, glossitis, loss of taste, ulcerative stomatitis, toothache, vomiting

Genitourinary: Albuminuria, hematuria, polyuria

Hepatic: ALT increased

Neuromuscular & skeletal: Back pain, extremity pain, hyperkinesia, rheumatoid arthritis, temporomandibular dislocation

Ocular: Eye pain, watery eyes

Respiratory: Bronchitis, bronchospasm, laryngitis, nasal congestion, nocturnal dyspnea, postnasal drip, sinus hypersecretion, throat burning

Miscellaneous: Allergic reactions, viral infection

<1%, postmarketing, and/or case reports: Anaphylactoid reaction, atrial fibrillation, chest pain, confusion, dyspnea, facial edema, involuntary muscle contractions, loss of smell, palpitation, paresthesia, parosmia, pruritus, rash, skin irritation, tolerance, transaminases increased, urinary retention, visual abnormalities, xerophthalmia

Ophthalmic:

>10%:

Central nervous system: Headache (15%)

Ocular: Transient burning/stinging (30%)

1% to 10%:

Central nervous system: Fatigue

Dermatologic: Pruritus

Gastrointestinal: Bitter taste (10%)

Ocular: Conjunctivitis, eye pain, blurred vision (temporary)

Respiratory: Asthma, dyspnea, pharyngitis, rhinitis

Miscellaneous: Flu-like syndrome

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 2C19, 2D6, 3A4; **Inhibits** CYP2B6 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may cause increased somnolence or fatigue).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, intranasal, as hydrochloride [spray]:

Astelin®: 1 mg/mL (30 mL) [contains benzalkonium chloride; 137 mcg/spray; 200 metered sprays]

Solution, ophthalmic, as hydrochloride:

Optivar®: 0.05% (6 mL) [contains benzalkonium chloride]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Astelin)

137 mcg/spray (30): $95.00

Solution (Optivar)

0.05% (6): $94.49

Mechanism of ActionCompetes with histamine for H$_1$-receptor sites on effector cells and inhibits the release of histamine and other mediators involved in the allergic response; when used intranasally, reduces hyper-reactivity of the airways; increases the motility of bronchial epithelial cilia, improving mucociliary transport

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Nasal spray: 3 hours; Ophthalmic solution: 3 minutes

Duration: Nasal spray: 12 hours; Ophthalmic solution: 8 hours

Distribution: V$_d$: 14.5 L/kg

Protein binding: Azelastine: 88%; Desmethylazelastine: 97%

Metabolism: Hepatic via CYP; active metabolite, desmethylazelastine

Bioavailability: Intranasal: 40%

Half-life elimination: 22 hours

Time to peak, serum: 2-3 hours

Excretion: Feces (75 %, <10% as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Bitter taste, xerostomia (normal salivary flow resumes upon discontinuation), aphthous stomatitis, glossitis, and burning sensation in throat. Chronic use of antihistamines will inhibit salivary flow, particularly in elderly patients. May contribute to periodontal disease and oral discomfort.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; rare reports of anxiety and nervousness

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation

Index TermsAzelastine Hydrochloride

Azithromycin may be confused with azathioprine, erythromycin

Zithromax® may be confused with Zinacef®

Pronunciation(az ith roe MYE sin)

U.S. Brand NamesAzaSite™; Zithromax®; Zmax™

Canadian Brand NamesApo-Azithromycin®; CO Azithromycin; Dom-Azithromycin; GMD-Azithromycin; Novo-Azithromycin; PHL-Azithromycin; PMS-Azithromycin; ratio-Azithromycin; Sandoz-Azithromycin; Zithromax®

Pharmacologic CategoryAntibiotic, Macrolide; Antibiotic, Ophthalmic

Use: Labeled Indications

Oral, I.V.: Treatment of acute otitis media due to *H. influenzae*, *M. catarrhalis*, or *S. pneumoniae*; pharyngitis/tonsillitis due to *S. pyogenes*; treatment of mild-to-moderate upper and lower respiratory tract infections, infections of the skin and skin structure, community-acquired pneumonia, pelvic inflammatory disease (PID), sexually-transmitted diseases (urethritis/cervicitis), pharyngitis/tonsillitis (alternative to first-line therapy), and genital ulcer disease (chancroid) due to susceptible strains of *C. trachomatis*, *M. catarrhalis*, *H. influenzae*, *S. aureus*, *S. pneumoniae*, *Mycoplasma pneumoniae*, and *C. psittaci*; acute bacterial exacerbations of chronic obstructive pulmonary disease (COPD) due to *H. influenzae*, *M. catarrhalis,* or *S. pneumoniae*; acute bacterial sinusitis

Ophthalmic: Bacterial conjunctivitis

Use: Unlabeled/InvestigationalPrevention of (or to delay onset of) or treatment of MAC in patients with advanced HIV infection; prophylaxis of infective endocarditis in patients who are allergic to penicillin and undergoing surgical or dental procedures; pertussis

Use: DentalAlternate oral antibiotic for prevention of infective endocarditis in individuals allergic to penicillins or ampicillin, when amoxicillin cannot be used; alternate antibiotic in the treatment of common orofacial infections caused by aerobic gram-positive cocci and susceptible anaerobes

Dosing: Adults**Note: Extended release suspension (Zmax™) is not interchangeable with immediate release formulations.** Use should be limited to approved indications. All doses are expressed as immediate release azithromycin unless otherwise specified.

Bacterial conjunctivitis: Instill 1 drop into affected eye(s) twice daily (8-12 hours apart) for 2 days, then 1 drop once daily for 5 days

Bacterial sinusitis: Oral: 500 mg/day for a total of 3 days

Extended release suspension (Zmax™): 2 g as a single dose

Cat scratch disease (unlabeled use): Oral: >45.5 kg: 500 mg as a single dose, then 250 mg once daily for 4 days

Chancroid due to*H. ducreyi:* Oral: 1 g as a single dose

Community-acquired pneumonia:

Oral (Zmax™): 2 g as a single dose

I.V.: 500 mg as a single dose for at least 2 days, follow I.V. therapy by the oral route with a single daily dose of 500 mg to complete a 7- to 10-day course of therapy.

Disseminated*M. avium*complex disease in patient with advanced HIV infection (unlabeled use): Oral:

Prophylaxis: 1200 mg once weekly (may be combined with rifabutin)

Treatment: 600 mg daily in combination with ethambutol 15 mg/kg

Prophylaxis against infective endocarditis (unlabeled use): Oral: 500 mg 30-60 minutes prior to the procedure. **Note:** American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur. As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Mild-to-moderate respiratory tract, skin, and soft tissue infections: Oral: 500 mg in a single loading dose on day 1 followed by 250 mg/day as a single dose on days 2-5

Alternative regimen: Bacterial exacerbation of COPD: 500 mg/day for a total of 3 days

Pelvic inflammatory disease (PID): I.V.: 500 mg as a single dose for 1-2 days, follow I.V. therapy by the oral route with a single daily dose of 250 mg to complete a 7-day course of therapy.

Pertussis (CDC guidelines): Oral: 500 mg on day 1 followed by 250 mg/day on days 2-5 (maximum: 500 mg/day)

Urethritis/cervicitis: Oral:

Due to *C. trachomatis*: 1 g as a single dose

Due to *N. gonorrhoeae*: 2 g as a single dose

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Note:** Adolescents ≥16 years: Refer to adult dosing.

Bacterial conjunctivitis: Children ≥1 year: Ophthalmic: Refer to adult dosing.

Bacterial sinusitis: Children ≥6 months: Oral: 10 mg/kg once daily for 3 days (maximum: 500 mg/day)

Cat scratch disease (unlabeled use): Oral: <45.5 kg: 10 mg/kg as a single dose, then 5 mg/kg once daily for 4 days

Community-acquired pneumonia: Children ≥6 months: Oral: 10 mg/kg on day 1 (maximum: 500 mg/day) followed by 5 mg/kg/day once daily on days 2-5 (maximum: 250 mg/day)

Disseminated*M. avium*(unlabeled use):

HIV-infected patients: Oral: 5 mg/kg/day once daily (maximum: 250 mg/day) or 20 mg/kg (maximum: 1200 mg) once weekly given alone or in combination with rifabutin

Treatment and secondary prevention in HIV-negative patients: 5 mg/kg/day once daily (maximum: 250 mg/day) in combination with ethambutol, with or without rifabutin

Prophylaxis against infective endocarditis (unlabeled use): Oral: 15 mg/kg 30-60 minutes before procedure. **Note:** American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur. As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Otitis media: Children ≥6 months: Oral:

1-day regimen: 30 mg/kg as a single dose (maximum dose: 1500 mg)

3-day regimen: 10 mg/kg once daily for 3 days (maximum: 500 mg/day)

5-day regimen: 10 mg/kg on day 1 (maximum: 500 mg/day) followed by 5 mg/kg/day once daily on days 2-5 (maximum: 250 mg/day)

Pharyngitis, tonsillitis: Children ≥2 years: Oral: 12 mg/kg/day once daily for 5 days (maximum: 500 mg/day)

Pertussis (CDC guidelines):

Children <6 months: 10 mg/kg/day for 5 day

Children ≥6 months: 10 mg/kg on day 1 (maximum: 500 mg/day) followed by 5 mg/kg/day once daily on days 2-5 (maximum: 250 mg/day)

Uncomplicated chlamydial urethritis or cervicitis (unlabeled use): Children ≥45 kg: 1 g as a single dose

Dosing: Renal ImpairmentUse caution in patients with Cl_{cr} <10 mL/minute
Dosing: Hepatic ImpairmentUse with caution due to potential for hepatotoxicity (rare). Specific guidelines for dosing in hepatic impairment have not been established.
Administration: I.V.Other medications should not be infused simultaneously through the same I.V. line.
Administration: I.V. DetailInfusate concentration and rate of infusion for azithromycin for injection should be either 1 mg/mL over 3 hours or 2 mg/mL over 1 hour.
Administration: OralImmediate release suspension and tablet may be taken without regard to food; extended release suspension should be taken on an empty stomach (at least 1 hour before or 2 hours following a meal), within 12 hours of reconstitution.
Administration: OtherOphthalmic: Shake bottle once prior to each administration. Wash hands before and after instillation.
Dietary Considerations

Oral suspension, immediate release, may be administered with or without food.

Oral suspension, extended release, should be taken on an empty stomach (at least 1 hour before or 2 hours following a meal).

Tablet may be administered with food to decrease GI effects.

Sodium content:

Injection: 114 mg (4.96 mEq) per vial

Oral suspension, immediate release: 3.7 mg per 100 mg/5 mL of constituted suspension; 7.4 mg per 200 mg/5 mL of constituted suspension; 37 mg per 1 g single-dose packet

Oral suspension, extended release: 148 mg per 2 g constituted suspension

Tablet: 0.9 mg/250 mg tablet; 1.8 mg/500 mg tablet; 2.1 mg/600 mg tablet

Storage

Injection (Zithromax®): Store intact vials of injection at room temperature. Reconstituted solution is stable for 24 hours when stored below

30°C/86°F.

Ophthalmic solution: Prior to use, store unopened under refrigeration at 2°C to 8°C (36°F to 46°F). After opening, store at 2°C to 25°C (36°F to 77°F) for ≤14 days; discard any remaining solution after 14 days.

Suspension, immediate release (Zithromax®): Store dry powder below 30°C (86°F). Following reconstitution, store at 5°C to 30°C (41°F to 86°F).

Suspension, extended release (Zmax™): Store dry powder below 30°C (86°F). Following reconstitution, store at 15°C to 30°C (59°F to 86°F); do not freeze. Should be consumed within 12 hours following reconstitution.

Tablet (Zithromax®): Store between 15°C to 30°C (59°F to 86°F).

ReconstitutionInjection (Zithromax®): Prepare initiation solution by adding 4.8 mL of sterile water for injection to the 500 mg vial (resulting concentration: 100 mg/mL). Use of a standard syringe is recommended due to the vacuum in the vial (which may draw additional solution through an automated syringe).

The initial solution should be further diluted to a concentration of 1 mg/mL (500 mL) to 2 mg/mL (250 mL) in 0.9% sodium chloride, 5% dextrose in water, or lactated Ringer's. The diluted solution is stable for 24 hours at or below room temperature (30°C or 86°F) and for 7 days if stored under refrigeration (5°C or 41°F).

CompatibilityOther medications should not be infused simultaneously through the same I.V. line.

ContraindicationsHypersensitivity to azithromycin, other macrolide antibiotics, or any component of the formulation

Allergy Considerations

- Macrolide Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: Macrolides have been associated with rare QT_c prolongation and ventricular arrhythmias, including torsade de pointes; use with caution in patients at risk of prolonged cardiac repolarization.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Gonorrhea/syphilis: May mask or delay symptoms of incubating gonorrhea or syphilis, so appropriate culture and susceptibility tests should be performed prior to initiating azithromycin.
- Hepatic impairment: Use with caution in patients with pre-existing liver disease; hepatic impairment, including hepatocellular and/or cholestatic hepatitis, with or without jaundice, has been observed. Discontinue if symptoms of malaise, nausea, vomiting, abdominal colic, and fever.
- Renal impairment: Use with caution in patients with severe renal impairment (Cl_{cr} <10 mL/minute).

Special populations:

- Contact lens wearers: Ophthalmic solution contains benzalkonium chloride which may be absorbed by contact lenses; contact lens should not be worn during treatment of ophthalmic infections.
- Pediatrics: Safety and efficacy of systemically-administered azithromycin (oral, intravenous) have not been established in children <6 months of age with acute otitis media, acute bacterial sinusitis, or community-acquired pneumonia, or in children <2 years of age with pharyngitis/tonsillitis. Safety and efficacy for ophthalmic use have not been established in children <1 year of age.

Dosage form specific issues:

- Oral suspensions: Immediate release and extended release suspensions are not interchangeable.
- Ophthalmic solution: Eye drops should not be injected subconjunctivally or introduced directly into the anterior chamber of the eye.

Geriatric ConsiderationsDosage adjustment does not appear to be necessary in the elderly. Considered to be one of the drugs of choice in the outpatient treatment of community-acquired pneumonia in elderly. Evaluate the patient's ability to self-administer the ophthalmic product.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events were not observed in animal studies; therefore, azithromycin is classified as pregnancy category B. Low levels of azithromycin have been shown to cross the placenta. Azithromycin may be used for the treatment of some infections during pregnancy. The CDC and IDSA provide recommendations for the treatment of chlamydial infections and MAC in pregnant patients. Since serum concentrations determine fetal exposure and azithromycin has much higher concentrations in tissue than serum, treatment results in the mother may be obtained with lower exposure to the fetus. Although no adverse reports in human or animal fetuses have been documented, information in pregnant women is limited.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsAzithromycin is excreted in low amounts into breast milk. Compared to erythromycin, azithromycin achieves higher tissue concentrations when compared to serum concentrations. Since serum concentrations determine infant exposure, azithromycin may achieve treatment results in the mother with less exposure to the breast-feeding infant. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Azithromycin in Pregnancy & Lactation

Adverse Reactions

>10%: Gastrointestinal: Diarrhea (4% to 9%; high single-dose regimens 14%), nausea (≤7%; high single-dose regimens 18%)

2% to 10%:

Dermatologic: Pruritus, rash

Gastrointestinal: Abdominal pain, anorexia, cramping, vomiting (especially with high single-dose regimens)

Genitourinary: Vaginitis

Local: (with I.V. administration): Injection site pain, inflammation

Ocular (with ophthalmic solution use): Eye irritation (1% to 2%)

≤1%: Systemic therapy: Agitation, allergic reaction, anemia, angioedema, bronchospasm, candidiasis, chest pain, cholestatic jaundice, conjunctivitis, constipation, cough increased, dermatitis (fungal), diaphoresis, dizziness, dyspepsia, eczema, enteritis, facial edema, fatigue, fever, flatulence, fungal infection, gastritis, headache, hyperkinesia, insomnia, jaundice, leukopenia, malaise, melena, mucositis, nephritis, nervousness, oral moniliasis, pain, palpitation, pharyngitis, photosensitivity, pleural effusion, rhinitis, somnolence, taste perversion, urticaria, vertigo, vesiculobullous rash

1%: Ophthalmic solution: Contact dermatitis, corneal erosion, dysgeusia, nasal congestion, ocular discharge, ocular dryness; ocular stinging, burning, and irritation upon instillation; punctate keratitis, sinusitis

Postmarketing and/or case reports (all formulations): Acute renal failure, aggressive behavior, anaphylaxis, anxiety, arrhythmia (including ventricular tachycardia), arthralgia, deafness, dehydration, edema, erythema multiforme (rare), hearing disturbance, hearing loss, hepatic failure (rare), hepatic necrosis (rare), hepatitis, hyperactivity, hypertrophic pyloric stenosis, hypotension, interstitial nephritis, loss of smell, loss of taste, LFTs increased, neutropenia (mild), oral candidiasis, pancreatitis, paresthesia, pseudomembranous colitis, QT_c prolongation (rare), seizure, smell perversion, somnolence, Stevens-Johnson syndrome (rare), syncope, thrombocytopenia, tinnitus, tongue discoloration (rare), torsade de pointes (rare), toxic epidermal necrolysis (rare), weakness

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor); **Inhibits** CYP3A4 (weak)
Drug Interactions

Amiodarone: Azithromycin may enhance the QTc-prolonging effect of Amiodarone. *Risk D: Consider therapy modification*

Cardiac Glycosides: Macrolide Antibiotics may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

CycloSPORINE: Macrolide Antibiotics may decrease the metabolism of CycloSPORINE. *Risk C: Monitor therapy*

Nelfinavir: May decrease the excretion of Azithromycin. *Risk C: Monitor therapy*

Tacrolimus: Macrolide Antibiotics may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Macrolide Antibiotics may decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Rate and extent of GI absorption may be altered depending upon the formulation. Azithromycin suspension, not tablet form, has significantly increased absorption (46%) with food.
Monitoring ParametersLiver function tests, CBC with differential
Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's allergy history prior to beginning therapy. Assess potential for interactions with other pharmacological agents patient may be taking. I.V.: See administration specifics. Evaluate results of laboratory tests (LFTs, CBC with diff), therapeutic effectiveness, and adverse effects. Instruct patients being treated for STDs about preventing transmission. Teach patient appropriate use (according to formulation and purpose for use), possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsLiver function, CBC with differential. Perform culture and sensitivity testing prior to initiating therapy.
Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. If administered by infusion; report immediately any redness, swelling, or pain at infusion site. If self-administered, take exactly as directed according to formulation. Take all of prescribed medication and do not discontinue without consulting prescriber until prescription is completed. Oral: Take extended release suspension 1 hour before or 2 hours after meals; immediate release suspension and tablets may be taken with or without food; tablet form may be taken with meals to decrease GI effects. Do not take with antacids that contain aluminum or magnesium. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If taken to treat a sexually-transmitted disease, follow advice of prescriber related to sexual intercourse and preventing transmission. May cause transient abdominal distress, diarrhea, and headache. Report signs of additional infections (eg, sores in mouth or vagina, vaginal discharge, unresolved fever, severe vomiting, or loose or foul-smelling stools). **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Ophthalmic: Store under refrigeration. Shake bottle once prior to each administration. Wash hands before and after installation. Tilt head back, invert bottle, and gently squeeze bottle to instill prescribed amount into the affected eye(s). Contact lenses should not be worn during treatment of ophthalmic infection. You may experience mild eye irritation (if persistent, contact prescriber).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: Strength expressed as base

Injection, powder for reconstitution, as dihydrate: 500 mg

Zithromax®: 500 mg [contains sodium 114 mg (4.96 mEq) per vial]

Injection, powder for reconstitution, as hydrogencitrate: 500 mg

Injection, powder for reconstitution, as monohydrate: 500 mg

Microspheres for oral suspension, extended release, as dihydrate:

Zmax™: 2 g [single-dose bottle; contains sodium 148 mg per bottle; cherry and banana flavor]

Powder for oral suspension, as monohydrate: 100 mg/5 mL (15 mL); 200 mg/5 mL (15 mL, 22.5 mL, 30 mL)

Powder for oral suspension, immediate release, as dihydrate:

Zithromax®: 100 mg/5 mL (15 mL) [contains sodium 3.7 mg/ 5 mL; cherry creme de vanilla and banana flavor]; 200 mg/5 mL (15 mL, 22.5 mL, 30 mL) [contains sodium 7.4 mg/5 mL; cherry creme de vanilla and banana flavor]; 1 g/packet (3s, 10s) [single-dose packet; contains sodium 37 mg per packet; cherry creme de vanilla and banana flavor]

Solution, ophthalmic:

AzaSite™: 1% (2.5 mL) [contains benzalkonium chloride]

Tablet, as dihydrate:

Zithromax®: 250 mg [contains sodium 0.9 mg per tablet]; 500 mg [contains sodium 1.8 mg per tablet]; 600 mg [contains sodium 2.1 mg per tablet]

Zithromax® TRI-PAK™ [unit-dose pack]: 500 mg (3s) [contains sodium 1.8 mg per tablet]

Zithromax® Z-PAK® [unit-dose pack]: 250 mg (6s) [contains sodium 0.9 mg per tablet]

Tablet, as monohydrate: 250 mg, 500 mg, 600 mg

Generic AvailableYes: Injection, powder for oral suspension, tablet

500 mg (3): $62.99

Tablets (Zithromax Z-Pak)

250 mg (6): $62.24

Mechanism of Action Inhibits RNA-dependent protein synthesis at the chain elongation step; binds to the 50S ribosomal subunit resulting in blockage of transpeptidation

Pharmacodynamics/Kinetics

Absorption: Oral: Rapid; Ophthalmic: Negligible

Distribution: Extensive tissue; distributes well into skin, lungs, sputum, tonsils, and cervix; penetration into CSF is poor; I.V.: 33.3 L/kg; Oral: 31.1 L/kg

Protein binding (concentration dependent): Oral, I.V.: 7% to 51%

Metabolism: Hepatic

Bioavailability: Oral: 38%, decreased by 17% with extended release suspension; variable effect with food (increased with immediate or delayed release oral suspension, unchanged with tablet)

Half-life elimination: Oral, I.V.: Terminal: Immediate release: 68-72 hours; Extended release: 59 hours

Time to peak, serum: Oral: Immediate release: 2-3 hours; Extended release: 5 hours

Excretion: Oral, I.V.: Biliary (major route); urine (6%)

Pharmacotherapy Pearls Zithromax® tablets and immediate release suspension may be interchanged (eg, two Zithromax® 250 mg tablets may be substituted for one Zithromax® 500 mg tablet or the tablets may be substituted with the immediate release suspension); however, the extended release suspension (Zmax™) is not bioequivalent with Zithromax® and therefore should not be interchanged.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Macrolides have been reported to cause nightmares, confusion, anxiety, and mood lability; may rarely cause dizziness, agitation, nervousness, and insomnia

Mental Health: Effects on Psychiatric Treatment Contraindicated with pimozide; may increase concentration of bromocriptine, carbamazepine, and triazolam

Cardiovascular Considerations The clinical implications of the association between infection (*Chlamydia* and cytomegalovirus) and coronary artery disease (CAD) is unknown. A recent trial showed no difference in clinical events in azithromycin-treated patients who had CAD and positive *C. pneumoniae* antibodies.

Index Terms Azithromycin Dihydrate; Azithromycin Hydrogencitrate; Azithromycin Monohydrate; Zithromax® TRI-PAK™; Zithromax® Z-PAK®

Aztreonam

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Aztreonam may be confused with azidothymidine

Pronunciation(AZ tree oh nam)

U.S. Brand NamesAzactam®

Canadian Brand NamesAzactam®

Pharmacologic CategoryAntibiotic, Miscellaneous

Use: Labeled IndicationsTreatment of patients with urinary tract infections, lower respiratory tract infections, septicemia, skin/skin structure infections, intra-abdominal infections, and gynecological infections caused by susceptible gram-negative bacilli

Dosing: Adults

Urinary tract infection: I.M., I.V.: 500 mg to 1 g every 8-12 hours

Moderately severe systemic infections:

I.M.: 1 g every 8-12 hours

I.V.: 1-2 g every 8-12 hours

Severe systemic or life-threatening infections (especially caused by*Pseudomonas aeruginosa*): I.V.: 2 g every 6-8 hours; maximum: 8 g/day

Meningitis (gram-negative): I.V.: 2 g every 6-8 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Susceptible infections: I.M., I.V.: Children >1 month:

Mild-to-moderate infections: 30 mg/kg every 8 hours

Moderate-to-severe infections: 30 mg/kg every 6-8 hours; maximum: 120 mg/kg/day (8 g/day)

Infection in children with cystic fibrosis: I.V.: Children >1 month: 50 mg/kg/dose every 6-8 hours (ie, up to 200 mg/kg/day); maximum: 8 g/day

Dosing: Renal ImpairmentAdults: Following initial dose, maintenance doses should be given as follows:

Cl_{cr} 10-30 mL/minute: 50% of usual dose at the usual interval

Cl_{cr} <10 mL/minute: 25% of usual dosage at the usual interval

Hemodialysis: Moderately dialyzable (20% to 50%); Loading dose of 500 mg, 1 g, or 2 g, followed by 25% of initial dose at usual interval; for serious/life-threatening infections, administer $^1/_8$ of initial dose after each hemodialysis session (given in addition to the maintenance doses)

Continuous ambulatory peritoneal dialysis (CAPD): Administer as for Cl_{cr} <10 mL/minute

Continuous renal replacement therapy (CRRT): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH: 1-2 g every 12 hours

CVVHD/CVVHDF: 2 g every 12 hours

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Administer by deep injection into large muscle mass, such as upper outer quadrant of gluteus maximus or the lateral part of the thigh. Doses >1 g should be administered I.V.

Administration: I.V.I.V. route is preferred for doses >1 g or in patients with severe life-threatening infections. Administer by slow I.V. push over 3-5 minutes or by intermittent infusion over 20-60 minutes.

Administration: I.V. DetailMonitor infusion/injection sites carefully. Administer around-the-clock to promote less variation in peak and trough serum levels.

pH: 4.5-7.5 (aqueous solution)

StoragePrior to reconstitution, store at room temperature; avoid excessive heat. Reconstituted solutions are colorless to light yellow straw and may turn pink upon standing without affecting potency. Use reconstituted solutions and I.V. solutions (in NS and D_5W) within 48 hours if kept at room temperature (25°C) or 7 days under refrigeration (4°C).

Infusion: Solution for infusion may be frozen at less than -2°C (less than -4°F) for up to 3 months. Thawed solution should be used within 24 hours if thawed at room temperature or within 72 hours if thawed under refrigeration. **Do not refreeze.**

Reconstitution

I.M.: Reconstitute with at least 3 mL SWFI, sterile bacteriostatic water for injection, NS, or bacteriostatic sodium chloride.

I.V.:

Bolus injection: Reconstitute with 6-10 mL SWFI.

Infusion: Reconstitute to a final concentration ≤2%; the final concentration should not exceed 20 mg/mL.

CompatibilitySolution for infusion: Stable in D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, mannitol 5%, mannitol 10%, LR, NS; **variable stability (consult detailed reference)** in peritoneal dialysis solution.

Y-site administration: Compatible: Allopurinol, amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, co-trimoxazole, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, dexamethasone sodium phosphate, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, etoposide, etoposide phosphate, famotidine, filgrastim, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, idarubicin, ifosfamide, imipenem/cilastatin, insulin (regular), leucovorin, linezolid, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, methylprednisolone sodium succinate, metoclopramide, minocycline, morphine, nalbuphine, netilmicin, ondansetron, piperacillin, piperacillin/tazobactam, plicamycin, potassium chloride, promethazine, propofol, ranitidine, remifentanil, sargramostim, sodium bicarbonate, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, vinblastine, vincristine, vinorelbine, zidovudine. **Incompatible:** Acyclovir, alatrofloxacin, amphotericin B, amphotericin B cholesteryl sulfate complex, amsacrine, chlorpromazine, daunorubicin, ganciclovir, lorazepam, metronidazole, mitomycin, mitoxantrone, prochlorperazine edisylate, streptozocin. **Variable (consult detailed reference):** Vancomycin.

Compatibility in syringe: Compatible: Clindamycin.

Compatibility when admixed: Compatible: Ampicillin/sulbactam, cefazolin, ciprofloxacin, clindamycin, gentamicin, linezolid, tobramycin. **Incompatible:** Metronidazole, nafcillin. **Variable (consult detailed reference):** Ampicillin, cefoxitin, vancomycin.

ContraindicationsHypersensitivity to aztreonam or any component of the formulation

Allergy Considerations

- Monobactam Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cephalosporin/penicillin allergy: Rare cross-allergenicity to penicillins and cephalosporins has been reported.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment..

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosing adjustment required.

Geriatric ConsiderationsAdjust dose relative to renal function.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal reproduction studies; therefore, the manufacturer classifies aztreonam as pregnancy category B. Aztreonam crosses the placenta and enters cord blood during middle and late pregnancy. Distribution to the fetus is minimal in early pregnancy. Aztreonam is used therapeutically in newborns.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsVery small amounts of aztreonam are excreted in breast milk. The poor oral absorption of aztreonam (<1%) may limit adverse effects to the infant. Although the manufacturer recommends considering temporary discontinuation of nursing during therapy, the AAP considers aztreonam to be "usually compatible with breast-feeding." Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Aztreonam in Pregnancy & Lactation

Adverse ReactionsAs reported in adults:

1% to 10%:

Dermatologic: Rash

Gastrointestinal: Diarrhea, nausea, vomiting

Local: Thrombophlebitis, pain at injection site

<1%: Abdominal cramps, abnormal taste, anaphylaxis, anemia, angioedema, aphthous ulcer, breast tenderness, bronchospasm, *C. difficile*-associated diarrhea, chest pain, confusion, diaphoresis, diplopia, dizziness, dyspnea, eosinophilia, erythema multiforme, exfoliative dermatitis, fever, flushing, halitosis, headache, hepatitis, hypotension, insomnia, jaundice, leukopenia, liver enzymes increased, muscular aches myalgia, neutropenia, numb tongue, pancytopenia, paresthesia, petechiae, pruritus, pseudomembranous colitis, purpura, seizure, sneezing, thrombocytopenia, tinnitus, toxic epidermal necrolysis, urticaria, vaginitis, vertigo, weakness, wheezing

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Test InteractionsMay interfere with urine glucose tests containing cupric sulfate (Benedict's solution, Clinitest®); positive Coombs' test

Monitoring ParametersPeriodic liver function test; monitor for signs of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's allergy history before initiating therapy. I.V.: Infusion site should be monitored closely. Assess therapeutic effectiveness and adverse response. Caution patients with diabetes about altered response to Clinitest®. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsObtain specimens for culture and sensitivity before the first dose.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by injection or infusion. Report immediately any burning, pain, swelling, or redness at infusion/injection site. May cause nausea or GI distress (frequent mouth care, frequent small meals, sucking lozenges, or chewing gum may help relieve these symptoms). If you have diabetes, drug may cause false tests with Clinitest® urine glucose monitoring; use of another type of glucose monitoring is preferable. Report any persistent and unrelieved diarrhea or vomiting, pain at injection site, unresolved fever, unhealed or new sores in mouth or vagina, vaginal discharge, or acute onset of respiratory difficulty. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Infusion premixed iso-osmotic solution:

Azactam®: 1 g (50 mL); 2 g (50 mL)

Injection, powder for reconstitution:

Azactam®: 500 mg [DSC], 1 g, 2 g

Generic AvailableNo

ManufacturerBristol-Myers Squibb Company (Pharmaceutical Division)

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested. Monobactam structure makes cross-allergenicity with beta-lactams unlikely.

Pharmacodynamics/Kinetics

Absorption: I.M.: Well absorbed; I.M. and I.V. doses produce comparable serum concentrations; Oral: <1%

Distribution: Widely to most body fluids and tissues

V_d: Children: 0.2-0.29 L/kg; Adults: 0.2 L/kg

Relative diffusion of antimicrobial agents from blood into CSF: Good only with inflammation (exceeds usual MICs)

CSF:blood level ratio: Meninges: Inflamed: 8% to 40%; Normal: ~1%

Protein binding: 56%

Metabolism: Hepatic (minor %)

Half-life elimination:

Children 2 months to 12 years: 1.7 hours

Adults: Normal renal function: 1.7-2.9 hours

End-stage renal disease: 6-8 hours

Time to peak: I.M., I.V. push: Within 60 minutes; I.V. infusion: 1.5 hours

Excretion: Urine (60% to 70% as unchanged drug); feces (~13% to 15%)

Related Information

- Antimicrobial Drugs of Choice

- Community-Acquired Pneumonia in Adults

Pharmacotherapy PearlsAlthough marketed as an agent similar to aminoglycosides, aztreonam is a monobactam antimicrobial with almost pure gram-negative aerobic activity. It cannot be used for gram-positive infections. Aminoglycosides are often used for synergy in gram-positive infections.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely produce confusion

Mental Health: Effects on Psychiatric TreatmentRarely produces leukopenia and neutropenia; use caution with clozapine and carbamazepine

Anesthesia and Critical Care Concerns/Other ConsiderationsAlthough marketed as an agent similar to aminoglycosides, aztreonam is a monobactam antimicrobial with almost pure gram-negative aerobic activity. It cannot be used for gram-positive infections, whereas aminoglycosides are often used for synergy in gram-positive infections.

Jump To Field (Select Field Name)

Pronunciation(bas i TRAY sin, nee oh MYE sin, pol i MIKS in bee, & hye droe KOR ti sone)
U.S. Brand NamesCortisporin® Ointment
Canadian Brand NamesCortisporin® Topical Ointment
Pharmacologic CategoryAntibiotic, Ophthalmic; Antibiotic, Topical; Corticosteroid, Ophthalmic; Corticosteroid, Topical
Use: Labeled IndicationsPrevention and treatment of susceptible inflammatory conditions where bacterial infection (or risk of infection) is present
Dosing: Adults

Ophthalmic infection: Ophthalmic ointment: Instill $^{1}/_{2}$ inch ribbon to inside of lower lid every 3-4 hours until improvement occurs.

Superficial dermal infection: Topical: Apply sparingly 2-4 times/day.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
StorageStore at controlled room temperature of 15°C to 25°C (59°F to 77°F).
ContraindicationsHypersensitivity to bacitracin, neomycin, polymyxin B, hydrocortisone, or any component of the formulation; not for use in viral infections, fungal diseases, mycobacterial infections
Allergy Considerations

- Bacitracin Allergy
- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Neomycin sensitization: Symptoms of neomycin sensitization include itching, reddening, edema, and failure to heal. Discontinuation of product and avoidance of similar products should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, and fluid and electrolyte changes.

Dosage form specific issues:

- Ophthalmic ointment: Should never be directly introduced into the anterior chamber. May retard corneal healing. Prolonged use may result in ocular hypertension/glaucoma, corneal and scleral thinning, potentially resulting in perforation. Use with caution in glaucoma. Avoid use following ocular cataract surgery. Inadvertent contamination of multiple-dose ophthalmic solutions, has caused bacterial keratitis.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined. For additional information, see individual agents.

Ophthalmic ointment:

Dermatologic: Delayed wound healing, rash

Ocular: Cataracts, corneal thinning, glaucoma, irritation, keratitis (bacterial), intraocular pressure increase, optic nerve damage, scleral thinning

Miscellaneous: Hypersensitivity (including anaphylaxis), secondary infection, sensitization to kanamycin, paromomycin, streptomycin, and gentamicin

Topical ointment:

Dermatologic: Acneiform eruptions, allergic contact dermatitis, burning skin, dryness, folliculitis, hypertrichosis, hypopigmentation, irritation, maceration of skin, miliaria, ocular hypertension, perioral dermatitis, pruritus, skin atrophy, striae

Otic: Ototoxicity

Renal: Nephrotoxicity

Miscellaneous: Hypersensitivity (including anaphylaxis), secondary infection, sensitization to karamycin, paromycin, streptomycin, and gentamicin

Metabolism/Transport EffectsHydrocortisone: **Substrate** of CYP3A4 (minor); **Induces** CYP3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Polymyxin B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

Cardiac Glycosides: Aminoglycosides may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

Colistimethate: Polymyxin B may enhance the neuromuscular-blocking effect of Colistimethate. *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents: Polymyxin B may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Monitoring ParametersIf ophthalmic ointment is used >10 days or in patients with glaucoma, monitor intraocular pressure (IOP).

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Ointment, ophthalmic: Bacitracin 400 units, neomycin 3.5 mg, polymyxin B 10,000 units, and hydrocortisone 10 mg per g (3.5 g)

Ointment, topical:

Cortisporin®: Bacitracin 400 units, neomycin 3.5 mg, polymyxin B 5000 units, and hydrocortisone 10 mg per g (15 g)

Generic AvailableYes: Ophthalmic ointment

Pricing: U.S. (www.drugstore.com)

U.S. Brand NamesNeosporin® Neo To Go® [OTC]; Neosporin® Ophthalmic Ointment [DSC]; Neosporin® Topical [OTC]
Canadian Brand NamesNeosporin® Ophthalmic Ointment
Pharmacologic CategoryAntibiotic, Ophthalmic; Antibiotic, Topical
Use: Labeled IndicationsHelps prevent infection in minor cuts, scrapes, and burns; short-term treatment of superficial external ocular infections caused by susceptible organisms
Dosing: Adults

Ophthalmic infection: Ophthalmic ointment: Instill $^{1}/_{2}$” into the conjunctival sac every 3-4 hours for 7-10 days for acute infections

Superficial dermal infection: Topical: Apply 1-3 times/day to infected area; may cover with sterile bandage if necessary.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
ContraindicationsHypersensitivity to neomycin, polymyxin B, zinc bacitracin, or any component of the formulation; epithelial herpes simplex keratitis; mycobacterial or fungal infections; topical ointments for external use only
Allergy Considerations

- Bacitracin Allergy

Warnings/Precautions

Ophthalmic ointment: Bacterial keratitis has been reported with the use of topical ophthalmic products in multiple-dose containers. Care should be taken to not contaminate the container.

Topical ointment: When used for self-medication (OTC use), patients should notify healthcare provider if needed for >1 week. Should not be used for self-medication on deep or puncture wounds, animal bites, or serious burns. Not for application to large areas of the body.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Dermatologic: Reddening, allergic contact dermatitis

Local: Itching, failure to heal, swelling, irritation

Ophthalmic: Conjunctival edema

Miscellaneous: Anaphylaxis

Drug Interactions

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Polymyxin B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

Cardiac Glycosides: Aminoglycosides may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

Colistimethate: Polymyxin B may enhance the neuromuscular-blocking effect of Colistimethate. *Risk C: Monitor therapy*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Polymyxin B may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Bacitracin may be confused with Bactrim®, Bactroban®

Pronunciation(bas i TRAY sin)

U.S. Brand NamesBaci-Rx; Baciguent® [OTC]; BaciiM®

Canadian Brand NamesBaciguent®; Baciject®

Pharmacologic CategoryAntibiotic, Miscellaneous; Antibiotic, Ophthalmic; Antibiotic, Topical

Use: Labeled IndicationsTreatment of susceptible bacterial infections mainly; has activity against gram-positive bacilli; due to toxicity risks, systemic and irrigant uses of bacitracin should be limited to situations where less toxic alternatives would not be effective

Use: Unlabeled/InvestigationalOral administration: Successful in antibiotic-associated colitis; has been used for enteric eradication of vancomycin-resistant enterococci (VRE)

Dosing: AdultsDo not administer I.V.:

Antibiotic-associated colitis: Oral: 25,000 units 4 times/day for 7-10 days

VRE eradication (unlabeled use): Oral: 25,000 units 4 times/day for 7-10 days

Superficial dermal infection: Topical: Apply 1-5 times/day.

Ophthalmic infection: Ophthalmic (ointment): Instill $^{1}/_{4}$" to $^{1}/_{2}$" ribbon every 3-4 hours into conjunctival sac for acute infections, or 2-3 times/day for mild-to-moderate infections for 7-10 days.

Local irrigation: Solution: 50-100 units/mL in normal saline, lactated Ringer's, or sterile water for irrigation; soak sponges in solution for topical compresses 1-5 times/day or as needed during surgical procedures.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDo not administer I.V.

Treatment of infection:

Infants: I.M.:

≤2.5 kg: 900 units/kg/day in 2-3 divided doses

>2.5 kg: 1000 units/kg/day in 2-3 divided doses

Children: I.M.: 800-1200 units/kg/day divided every 8 hours

Superficial dermal infection: Topical: Refer to adult dosing.

Ophthalmic infection: Ophthalmic (ointment): Refer to adult dosing.

Local irrigation: Solution: Refer to adult dosing.

Administration: I.M.For I.M. administration only. pH of urine should be kept >6 by using sodium bicarbonate. Bacitracin sterile powder should be dissolved in 0.9% sodium chloride injection containing 2% procaine hydrochloride. Do not use diluents containing parabens.

Administration: I.V.Not for I.V. administration.

Administration: OralThe injection formulation is extemporaneously prepared and flavored to improve palatability.

ReconstitutionFor I.M. use only. Bacitracin sterile powder should be dissolved in 0.9% sodium chloride injection containing 2% procaine hydrochloride. Once reconstituted, bacitracin is stable for 1 week under refrigeration (2°C to 8°C). Sterile powder should be stored in the refrigerator. Do not use diluents containing parabens.

Extemporaneously PreparedIn some institutions, oral formulations have been prepared either by preparation of capsules from powder or oral administration of I.V. solution.

ContraindicationsHypersensitivity to bacitracin or any component of the formulation; I.M. use is contraindicated in patients with renal impairment

Allergy Considerations

- Bacitracin Allergy

Warnings/Precautions

Boxed warnings:

- Renal failure: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Renal failure: **[U.S. Boxed Warning]: I.M. use may cause renal failure due to tubular and glomerular necrosis; monitor renal function daily.** Avoid concurrent use with other nephrotoxic drugs; discontinue use if toxicity occurs.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment..

Other warnings/precautions:

- Appropriate administration: Do not administer intravenously because severe thrombophlebitis occurs.

Pregnancy ConsiderationsIt is unknown if bacitracin crosses the placenta. The minimal absorption after topical use should limit the amount of medication available for transfer to the fetus.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is unknown if bacitracin is distributed in human milk. The minimal absorption after topical use should limit the amount of medication available for transfer.

Pregnancy & Lactation, In-Depth

- Bacitracin in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Cardiovascular: Hypotension, edema of the face/lips, chest tightness

Central nervous system: Pain

Dermatologic: Rash, itching

Gastrointestinal: Anorexia, nausea, vomiting, diarrhea, rectal itching

Hematologic: Blood dyscrasias

Miscellaneous: Diaphoresis

<1%: Rare cases of anaphylaxis have been reported in association with topical and intraoperative exposures.

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersI.M.: Urinalysis, renal function tests

Nursing: Physical Assessment/MonitoringDo not administer I.V. Assess potential for interactions with other pharmacological agents patient may be taking (eg, nephrotoxic drugs, neuromuscular blocking agents, and anesthetics). Assess laboratory results (urinalysis and renal function with I.M.), effectiveness of therapy, and adverse reactions. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsI.M.: Urinalysis, renal function

Patient Education

Oral/I.M.: Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Report rash, redness, or itching; change in urinary pattern; acute dizziness; swelling of face or lips; chest pain or tightness; acute nausea or vomiting; or loss of appetite (small, frequent meals or frequent mouth care may help).

Ophthalmic: Instill as many times per day as directed. Wash hands before using. Gently pull lower eyelid forward, instill prescribed amount of ointment into lower eyelid. Close eye and roll eyeball in all directions. May cause blurred vision; use caution when driving or engaging in tasks that require clear vision. Report any adverse reactions such as rash or itching, swelling of face or lips, burning or pain in eye, worsening of condition, or if condition does not improve.

Topical: Apply a thin film as many times a day as prescribed to the affected area. May cover with porous sterile bandage (avoid occlusive dressings). Do not use longer than 1 week unless advised by prescriber. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 50,000 units

BaciiM®: 50,000 units

Ointment, ophthalmic: 500 units/g (3.5 g)

Ointment, topical: 500 units/g (0.9 g, 15 g, 30 g, 120 g, 454 g)

Baciguent®: 500 units/g (15 g, 30 g)

Powder, for prescription compounding [micronized]:

Baci-Rx: 5 million units

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Ointment (Bacitracin)

500 units/g (3.5): $8.99

500 units/g (28.4): $12.99

Mechanism of ActionInhibits bacterial cell wall synthesis by preventing transfer of mucopeptides into the growing cell wall

Pharmacodynamics/Kinetics

Duration: 6-8 hours

Absorption: Poor from mucous membranes and intact or denuded skin; rapidly following I.M. administration; not absorbed by bladder irrigation, but absorption can occur from peritoneal or mediastinal lavage

Distribution: CSF: Nil even with inflammation

Protein binding, plasma: Minimal

Time to peak, serum: I.M.: 1-2 hours

Excretion: Urine (10% to 40%) within 24 hours

Related Information

- Antimicrobial Drugs of Choice

Pharmacotherapy Pearls1 unit is equivalent to 0.026 mg

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Baclofen may be confused with Bactroban®

Lioresal® may be confused with lisinopril, Lotensin®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (intrathecal administration) among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(BAK loe fen)

U.S. Brand NamesLioresal®

Canadian Brand NamesApo-Baclofen®; Gen-Baclofen; Lioresal®; Liotec; Nu-Baclo; PMS-Baclofen

Pharmacologic CategorySkeletal Muscle Relaxant

Use: Labeled IndicationsTreatment of reversible spasticity associated with multiple sclerosis or spinal cord lesions

Orphan drug: Intrathecal: Treatment of intractable spasticity caused by spinal cord injury, multiple sclerosis, and other spinal disease (spinal ischemia or tumor, transverse myelitis, cervical spondylosis, degenerative myelopathy)

Use: Unlabeled/InvestigationalIntractable hiccups, intractable pain relief, bladder spasticity, trigeminal neuralgia, cerebral palsy, Huntington's chorea

Dosing: Adults

Spasticity:

Oral: 5 mg 3 times/day, may increase 5 mg/dose every 3 days to a maximum of 80 mg/day

Intrathecal:

Test dose: 50-100 mcg, doses >50 mcg should be given in 25 mcg increments, separated by 24 hours. A screening dose of 25 mcg may be considered in very small patients. Patients not responding to screening dose of 100 mcg should not be considered for chronic infusion/implanted pump.

Maintenance: After positive response to test dose, a maintenance intrathecal infusion can be administered via an implanted intrathecal pump. Initial dose via pump: Infusion at a 24-hourly rate dosed at twice the test dose. Avoid abrupt discontinuation.

Hiccups (unlabeled use): Oral: 10-20 mg 2-3 times/day

Dosing: ElderlyOral (the lowest effective dose is recommended): Initial: 5 mg 2-3 times/day, increasing gradually as needed; if benefits are not seen withdraw the drug slowly.

Dosing: Pediatric**Spasticity:**

Oral (avoid abrupt withdrawal of drug) (unlabeled use): Caution: Pediatric dosing expressed as a daily amount, and NOT in mg/kg. Limited published data in children; the following is a compilation of small prospective studies (Albright, 1996; Milla, 1977; Scheinberg, 2006) and one large retrospective study (Lubsch, 2006):

<2 years: 10-20 mg daily divided every 8 hours; titrate dose every 3 days in increments of 5-15mg/day to a maximum of 40 mg daily

2-7 years: Initial: 20-30 mg daily divided every 8 hours; titrate dose every 3 days in increments of 5-15 mg/day to a maximum of 60 mg daily

≥8 years: 30-40 mg daily divided every 8 hours; titrate dose every 3 days in increments of 5-15 mg/day to a maximum of 120 mg daily

Note: Baclofen dose may need to be increased over time. One retrospective analysis (Lubsch, 2006) suggested that increased doses were needed as the time increased from spasticity onset, as age increased, and as the number of concomitant antispasticity medications increased. A small number of patients required daily doses exceeding 200 mg.

Intrathecal: Refer to adult dosing.

Dosing: Renal ImpairmentMay be necessary to reduce dosage; no specific guidelines have been established

Administration: I.V. DetailpH: 5-7

Administration: OtherIntrathecal: For screening dosages, dilute with preservative-free sodium chloride to a final concentration of 50 mcg/mL for bolus injection into the subarachnoid space. For maintenance infusions, concentrations of 500-2000 mcg/mL may be used.

CompatibilityStable in sterile, preservative free NS.

Compatibility when admixed: Compatible: Morphine.

Extemporaneously PreparedMake a 5 mg/mL suspension by crushing fifteen 20 mg tablets; wet with glycerin, gradually add 45 mL simple syrup in 3 x 5 mL aliquots to make a total volume of 60 mL; refrigerate; stable 35 days

> Johnson CE and Hart SM, “Stability of an Extemporaneously Compounded Baclofen Oral Liquid,” *Am J Hosp Pharm*, 1993, 50:2353-5.

ContraindicationsHypersensitivity to baclofen or any component of the formulation

Allergy Considerations

- Baclofen Allergy

Warnings/Precautions

Boxed warnings:

- Abrupt withdrawal: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment.

- Seizure disorder. Use with caution in patients with a history of seizure disorder.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse CNS effects, especially at higher doses.

Other warnings/precautions:

- Abrupt withdrawal: **[U.S. Boxed Warning]: Avoid abrupt withdrawal of the drug; abrupt withdrawal of intrathecal baclofen has resulted in severe sequelae (hyperpyrexia, obtundation, rebound/exaggerated spasticity, muscle rigidity, and rhabdomyolysis), leading to organ failure and some fatalities.** Risk may be higher in patients with injuries at T-6 or above, history of baclofen withdrawal, or limited ability to communicate.

Geriatric ConsiderationsThe elderly are more sensitive to the effects of baclofen and are more likely to experience adverse CNS effects at higher doses. Two cases of encephalopathy were reported after inadvertent high doses (50 mg/day and 90 mg/day) were given to elderly patients.

Pregnancy Risk FactorC

LactationEnters breast milk (small amounts)/compatible

Adverse Reactions

>10%:

> Central nervous system: Drowsiness, vertigo, psychiatric disturbances, insomnia, slurred speech, ataxia, hypotonia
>
> Neuromuscular & skeletal: Weakness

1% to 10%:

> Cardiovascular: Hypotension
>
> Central nervous system: Fatigue, confusion, headache
>
> Dermatologic: Rash
>
> Gastrointestinal: Nausea, constipation
>
> Genitourinary: Polyuria

<1%: Palpitation, chest pain, syncope, euphoria, excitement, depression, hallucinations, xerostomia, anorexia, abnormal taste, abdominal pain, vomiting, diarrhea, enuresis, urinary retention, dysuria, impotence, inability to ejaculate, nocturia, paresthesia, hematuria, dyspnea

Withdrawal reactions have occurred with abrupt discontinuation (particularly severe with intrathecal use).

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola.

Test InteractionsIncreased alkaline phosphatase, AST, glucose, ammonia (B); decreased bilirubin (S)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake this drug as prescribed. Do not discontinue this medicine without consulting prescriber (abrupt discontinuation may cause hallucinations). Do not take any prescription or OTC sleep-inducing drugs, sedatives, or antispasmodics without consulting prescriber. Avoid alcohol use. You may experience transient drowsiness, lethargy, or dizziness; use caution when driving or engaging in tasks requiring alertness until response to drug is known. Frequent small meals or lozenges may reduce GI upset.

Intrathecal use: Keep scheduled pump refill visits; abrupt interruption can cause serious withdrawal symptoms. Report increased spasticity, itching, numbness, unresolved insomnia, painful urination, change in urinary patterns, constipation, high fever, or persistent confusion.

Pregnancy precaution: Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, intrathecal [preservative free]:

Lioresal®: 50 mcg/mL (1 mL); 500 mcg/mL (20 mL); 2000 mcg/mL (5 mL, 20 mL)

Tablet: 10 mg, 20 mg

Generic AvailableYes: Tablets only

Pricing: U.S. (www.drugstore.com)

Tablets (Baclofen)

10 mg (30): $9.99

20 mg (30): $15.99

Mechanism of ActionInhibits the transmission of both monosynaptic and polysynaptic reflexes at the spinal cord level, possibly by hyperpolarization of primary afferent fiber terminals, with resultant relief of muscle spasticity

Pharmacodynamics/Kinetics

Onset of action: 3-4 days

Peak effect: 5-10 days

Absorption (dose dependent): Oral: Rapid

Protein binding: 30%

Metabolism: Hepatic (15% of dose)

Half-life elimination: 3.5 hours

Time to peak, serum: Oral: Within 2-3 hours

Excretion: Urine and feces (85% as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and insomnia are common; rare reports of depression, euphoria, and hallucinations

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation; concurrent use with MAO inhibitors may potentiate their hypotensive effects

Anesthesia and Critical Care Concerns/Other ConsiderationsAvoid abrupt withdrawal of the drug; abrupt withdrawal of intrathecal baclofen has resulted in severe sequelae (hyperpyrexia, obtundation, rebound/exaggerated spasticity, muscle rigidity, and rhabdomyolysis), leading to organ failure and some fatalities. Risk may be higher in patients with injuries at T-6 or above, history of baclofen withdrawal, or limited ability to communicate. Elderly are more sensitive to the effects of baclofen and are more likely to experience adverse CNS effects at higher doses.

Balanced Salt Solution

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(BAL anced salt soe LOO shun)
U.S. Brand NamesAquaLase™; BSS Plus®; BSS®
Canadian Brand NamesBSS Plus®; BSS®; Eye-Stream®
Pharmacologic CategoryIrrigating Solution; Ophthalmic Agent, Miscellaneous
Use: Labeled Indications

Irrigation solution for ophthalmic surgery:

AquaLase™, BSS®: Intraocular or extraocular irrigating solution

BSS® Plus: Intraocular irrigating solution

Irrigation solution for eyes, ears, nose, or throat

Dosing: AdultsIrrigation: Based on standard for each surgical procedure
Dosing: ElderlyRefer to adult dosing.
StorageStore between 2°C to 25°C (36°F to 77°F); do not freeze.
ReconstitutionBSS Plus®: Prior to administration, add contents of the “Part II” vial to the contents of the “Part I” bottle. Mix gently and use within 6 hours.
ContraindicationsHypersensitivity to any component of the formulation; injection or I.V. infusion; use during electrosurgical procedures
Warnings/Precautions

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; intraoperative lens changes have been observed when undergoing vitrectomy procedure.

Other warnings/precautions:

- Appropriate use: For use during surgical procedures with an expected duration ≤60 minutes.

Adverse ReactionsFrequency not defined.

Ocular: Bullous keratopathy, corneal clouding, corneal decompensation, corneal edema, corneal swelling, inflammatory reactions, lens changes

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, irrigation [preservative free]: Sodium chloride 0.64%, potassium chloride 0.075%, calcium chloride 0.048%, magnesium chloride 0.03%, sodium acetate 0.39%, sodium citrate 0.17% (500 mL)

Solution, ophthalmic [irrigation; preservative free]: Sodium chloride 0.64%, potassium chloride 0.075%, calcium chloride 0.048%, magnesium chloride 0.03%, sodium acetate 0.39%, sodium citrate 0.17% (18 mL, 500 mL)

AquaLase™: Sodium chloride 0.64%, potassium chloride 0.075%, calcium chloride 0.048%, magnesium chloride 0.03%, sodium acetate 0.39%, sodium citrate 0.17% (90 mL)

BSS®: Sodium chloride 0.64%, potassium chloride 0.075%, calcium chloride 0.048%, magnesium chloride 0.03%, sodium acetate 0.39%, sodium citrate 0.17% (15 mL, 30 mL, 250 mL, 500 mL)

BSS Plus®: Sodium chloride 0.71%, potassium chloride 0.038%, calcium chloride 0.015%, magnesium chloride 0.02%, sodium phosphate 0.042%, sodium bicarbonate 0.21%, dextrose 0.092%, glutathione 0.018% (250 mL, 500 mL)

Balsalazide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Colazal® may be confused with Clozaril®

Pronunciation(bal SAL a zide)

U.S. Brand NamesColazal®

Pharmacologic Category[5-Aminosalicylic Acid Derivative](); [Anti-inflammatory Agent]()

Use: Labeled IndicationsTreatment of mild-to-moderate active ulcerative colitis

Dosing: Adults**Ulcerative colitis:** Oral: 2.25 g (three 750 mg capsules) 3 times/day for 8-12 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Ulcerative colitis:** Oral: Children 5-17 years: 750 mg 3 times/day for up to 8 weeks **or** 2.25 g (three 750 mg capsules) 3 times/day for 8 weeks

Dosing: Renal ImpairmentRenal toxicity has been observed with other 5-aminosalicylic acid products; use with caution.

Dosing: Hepatic ImpairmentNo specific dosage adjustment available.

Administration: OralCapsules should be swallowed whole or may be opened and sprinkled on applesauce. Applesauce mixture may be chewed; swallow immediately, do not store mixture for later use. When sprinkled on food, may cause staining of teeth or tongue.

Dietary ConsiderationsColazal® 750 mg capsule contains sodium ~86 mg.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to balsalazide, metabolites to balsalazide, salicylates, or any component of the formulation

Allergy Considerations

- [5-Aminosalicylic Acid Derivative Allergy]()

Warnings/Precautions

Concerns related to adverse effects:

- Colitis: May exacerbate symptoms of ulcerative colitis.

Disease-related concerns:

- Pyloric stenosis: Use with caution in patients with pyloric stenosis; prolonged gastric retention of capsules may occur, delaying release of drug in the colon.
- Renal impairment: Use with caution in patients with renal impairment; renal toxicity has been observed with other mesalamine (5-aminosalicylic acid) products.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <5 years of age.

Other warnings/precautions:

- Duration of therapy: Safety and efficacy of use beyond 12 weeks in adults or 8 weeks in children have not been established.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies have been done in pregnant women. Balsalazide should be used in pregnant women only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Headache (children 15%; adults 8%)

Gastrointestinal: Abdominal pain (children 12% to 13%; adults 6%)

1% to 10%:

Central nervous system: Insomnia (adults 2%), fatigue (children 4%; adults 2%), fever (children 6%; adults 2%)

Endocrine & metabolic: Dysmenorrhea (children 3%)

Gastrointestinal: Diarrhea (children 9%; adults 5%), ulcerative colitis exacerbation (children 6%; adults 1%), nausea (children 4%; adults 5%), vomiting (children 10%; adults 4%), hematochezia (children 4%), stomatitis (children 3%), anorexia (adults 2%), dyspepsia (adults

2%), flatulence (adults 2%), cramps (adults 1%), constipation (adults 1%), xerostomia (adults 1%)

Genitourinary: Urinary tract infection (adults 1%)

Neuromuscular & skeletal: Arthralgia (adults 4%), back pain (adults 2%), myalgia (adults 1%)

Respiratory: Respiratory infection (adults 4%), cough (children 3%; adults 2%), pharyngitis (children 6%; adults 2%), pharyngolaryngeal pain (children 3%), rhinitis (adults 2%)

Miscellaneous: Flu-like syndrome (children 4%; adults 1%)

Postmarketing and/or case reports: Alopecia, cholestatic jaundice, cirrhosis, hepatocellular damage, hepatotoxicity, jaundice, hypersensitivity pericarditis, Kawasaki-like syndrome, liver failure, liver necrosis, liver function tests increased, myocarditis

Drug Interactions

Cardiac Glycosides: 5-ASA Derivatives may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

Thiopurine Analogs: 5-ASA Derivatives may decrease the metabolism of Thiopurine Analogs. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: 5-ASA Derivatives may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. The primary concern is the potential development of Reye's Syndrome, a condition that has been associated with the use of salicylates in children with varicella infections. *Risk D: Consider therapy modification*

Monitoring ParametersImprovement or worsening of symptoms

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as disodium: 750 mg

Colazal®: 750 mg [contains sodium ~86 mg/capsule]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Balsalazide Disodium)

750 mg (280): $319.98

Capsules (Colazal)

750 mg (280): $449.96

Mechanism of ActionBalsalazide is a prodrug, converted by bacterial azoreduction to 5-aminosalicylic acid (mesalamine, active), 4-aminobenzoyl-β-alanine (inert), and their metabolites. 5-aminosalicylic acid may decrease inflammation by blocking the production of arachidonic acid metabolites topically in the colon mucosa.

Pharmacodynamics/Kinetics

Onset of action: Delayed; may require several days to weeks

Absorption: Very low and variable

Protein binding: Balsalazide: ≥99%

Metabolism: Azoreduced in the colon to 5-aminosalicylic acid (active), 4-aminobenzoyl-β-alanine (inert), and N-acetylated metabolites

Half-life elimination: Primary effect is topical (colonic mucosa); systemic half-life not determined

Time to peak: Balsalazide: 1-2 hours

Excretion: Feces (65% as 5-aminosalicylic acid, 4-aminobenzoyl-β-alanine, and N-acetylated metabolites); urine (25% as N-acetylated metabolites); Parent drug: Urine or feces (<1%)

Pharmacotherapy PearlsBalsalazide 750 mg is equivalent to mesalamine 267 mg

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia, fatigue, and dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsBalsalazide Disodium

Jump To Field (Select Field Name)

Pronunciation(BA ree um)

U.S. Brand NamesAnatrast; Bar-Test; Baricon™; Baro-Cat®; Barobag®; Barosperse®; CheeTah®; E-Z-Cat®; E-Z-Cat® Dry; E-Z-Disk™; Enhancer; Entero Vu™; Entrobar®; EntroEase®; Esopho-Cat®; HD 200® Plus; Intropaste; Liqui-Coat HD®; Liquid Barosperse®; Medebar® Plus; Prepcat; Readi-Cat®; Readi-Cat® 2; Tomocat®; Tomocat® 1000; Tonojug; Tonopaque; Varibar® Honey; Varibar® Nectar; Varibar® Pudding; Varibar® Thin Honey; Varibar® Thin Liquid; VoLumen™

Pharmacologic CategoryRadiopaque Agents

Use: Labeled IndicationsDiagnostic aid for computed tomography or x-ray examinations of the GI tract

ContraindicationsHypersensitivity to barium or any component of the formulation; known or suspected obstruction of the colon, known or suspected GI tract perforation, suspected tracheoesophageal fistula, obstructing lesions of small intestine, pyloric stenosis

Specific agents may also be contraindicated with inflammation or neoplastic lesions of the rectum, recent rectal biopsy; use in infants with swallowing disorders; newborns with complete duodenal or jejunal obstruction with suspected distal small bowel or colon obstruction; very small preterm infants and young babies requiring small volumes of contrast media; infants and young children with possible leakage from GI tract (eg, necrotizing enterocolitis, unexplained pneumoperitoneum, gasless abdomen, bowel or esophageal perforation, postoperative anastomosea)

Pregnancy ConsiderationsSafety and efficacy for use during pregnancy have not been established. In general, elective radiography of the abdomen is avoided during pregnancy unless essential for diagnosis.

Breast-Feeding ConsiderationsBarium sulfate is not systemically absorbed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, oral, as sulfate:

Esopho-Cat®: 3% w/w (30 g) [contains sodium benzoate; vanilla flavor]

Paste, oral, as sulfate:

Varibar® Pudding: 40% w/v (230 mL) [target viscosity 5000 CPS; contains sodium benzoate; vanilla flavor]

Powder for suspension, oral, as sulfate:

Baricon™: 98% w/w (340 g) [lemon-vanilla flavor]

Enhancer: 98% w/w (312 g) [lemon-vanilla flavor]

E-Z-Cat® Dry: 2% w/w (23 g) [provides 450 mL 2% w/w suspension after mixing; orange vanilla flavor]

HD 200® Plus: 98% w/w (312 g) [strawberry flavor]

Tonopaque: 95% w/w (180 g) [cherry flavor]

Varibar® Thin Liquid: 40% w/v (148 g) [provides 40% w/v suspension after mixing; target viscosity 4 CPS; apple flavor]

Powder for suspension, oral/rectal, as sulfate:

Barosperse®: 95% w/w (225 g, 900 g) [vanilla flavor]

Tonojug: 95% w/w (1200 g) [cherry flavor]

Powder for suspension, rectal, as sulfate:

Barobag®: 97% w/w (340 g, 454 g) [packaged as an enema kit]

Suspension, oral, as sulfate:

Entero Vu™: 24% w/v (600 mL) [contains sodium benzoate; blueberry flavor]

EntroEase®: 13% w/v (600 mL) [contains sodium benzoate; marshmallow flavor]

E-Z-Cat®: 4.9% w/v (255 mL) [orange flavor]

Liqui-Coat HD®: 210% w/v (150 mL) [contains sodium benzoate; vanilla-raspberry flavor]

Readi-Cat® 2: 2.1% w/v (250 mL) [contains benzoic acid and sodium benzoate; banana smoothie flavor]; (450 mL) [contains benzoic acid and sodium benzoate; apple smoothie, banana smoothie, and berry smoothie flavors]

Varibar® Honey: 40% w/v (250 mL) [target viscosity 3000 CPS; contains sodium benzoate; apple flavor]

Varibar® Nectar: 40% w/v (240 mL) [target viscosity 300 CPS; contains sodium benzoate; apple flavor]

Varibar® Thin Honey: 40% w/v (250 mL) [target viscosity 1500 CPS; contains sodium benzoate; apple flavor]

VoLumen™: 0.1% w/v (450 mL) [contains benzoic acid, sodium benzoate; blueberry flavor]

Suspension, oral/rectal, as sulfate:

Baro-Cat®: 1.5% w/v (300 mL, 900 mL) [banana-pineapple flavor]

CheeTah®: 2.2% w/w (450 mL, 900 mL) [contains sodium benzoate; butterscotch vanilla flavor]

Liquid Barosperse®: 60% w/v (355 mL) [vanilla flavor]

Prepcat: 1.5% w/v (450 mL) [strawberry flavor]

Readi-Cat®: 1.3% w/v (450 mL, 900 mL, 1900 mL) [contains sodium benzoate; orange vanilla flavor; also supplied as a Cat-Pak with enema tubing]

Readi-Cat® 2: 2.1% w/v (450 mL, 900 mL, 1900 mL) [contains sodium benzoate; orange vanilla flavor]

Tomocat®: 5% w/v (145 mL) [concentrate to make a 1.5% solution; strawberry flavor]

Tomocat® 1000: 5% w/v (225 mL) [concentrate; strawberry flavor]

Suspension paste, rectal:

Anatrast: 100% w/v (500 g) [suspension paste; packaged with enema tips]

Intropaste: 70% w/v (454 g) [raspberry flavor]

Suspension, rectal, as sulfate:

Entrobar®: 50% w/v (500 mL) [packaged in administration kit]

Medebar® Plus: 100% w/v (1900 mL)

Tablet, oral, as sulfate:

Bar-Test, E-Z-Disk™: 648 mg

Generic AvailableNo

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Basiliximab

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ba si LIK si mab)

U.S. Brand NamesSimulect®

Canadian Brand NamesSimulect®

Pharmacologic CategoryMonoclonal Antibody

Use: Labeled IndicationsProphylaxis of acute organ rejection in renal transplantation

Dosing: Adults**Note:** Patients previously administered basiliximab should only be re-exposed to a subsequent course of therapy with extreme caution.

Renal transplantation: I.V.: 20 mg within 2 hours prior to transplant surgery, followed by a second 20 mg dose 4 days after transplantation. The second dose should be withheld if complications occur (including severe hypersensitivity reactions or graft loss).

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Patients previously administered basiliximab should only be re-exposed to a subsequent course of therapy with extreme caution.

Renal transplantation: I.V.:

Children <35 kg: 10 mg within 2 hours prior to transplant surgery, followed by a second 10 mg dose 4 days after transplantation; the second dose should be withheld if complications occur (including severe hypersensitivity reactions or graft loss)

Children ≥35 kg: Refer to adult dosing

Dosing: Renal ImpairmentNo specific dosing adjustment is recommended.

Dosing: Hepatic ImpairmentNo specific dosing adjustment is recommended.

Administration: I.V.For intravenous administration only. Infuse as a bolus or I.V. infusion over 20-30 minutes. (Bolus dosing is associated with nausea, vomiting and local pain at the injection site.)

StorageStore intact vials under refrigeration 2°C to 8°C (36°F to 46°F). It is recommended that after reconstitution, the solution should be used immediately. If not used immediately, it can be stored at 2°C to 8°C for up to 24 hours or at room temperature for up to 4 hours. Discard the reconstituted solution within 24 hours.

ReconstitutionReconstitute vials with sterile water for injection, USP. Shake the vial gently to dissolve. Further dilute reconstituted solution with 25-50 mL 0.9% sodium chloride or dextrose 5% in water. When mixing the solution, gently invert the bag to avoid foaming. Do not shake.

ContraindicationsHypersensitivity to basiliximab, murine proteins, or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Severe hypersensitivity reactions, occurring within 24 hours, have been reported. Reactions, including anaphylaxis, have occurred both with the initial exposure and/or following re-exposure after several months; use caution during re-exposure to a subsequent course of therapy in a patient who has previously received basiliximab. Discontinue the drug permanently if a reaction occurs. Medications for the treatment of hypersensitivity reactions should be available for immediate use.

- Human antimurine antibodies (HAMA): Treatment may result in the development of HAMA; however, limited evidence suggesting the use of muromonab-CD3 or other murine products is not precluded.

- Lymphoproliferative disorders: The incidence of lymphoproliferative disorders may be increased by immunosuppressive therapy.

- Opportunistic infections: The incidence opportunistic infections may be increased by immunosuppressive therapy.

Other warnings/precautions:

- Appropriate use: To be used as a component of immunosuppressive regimen which includes cyclosporine and corticosteroids.

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of a physician experienced in immunosuppression therapy.**

Pregnancy Risk FactorB (manufacturer)

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. IL-2 receptors play an important role in the development of the immune system. Use in pregnant women only when benefit exceeds potential risk to the fetus. Women of childbearing potential should use effective contraceptive measures before beginning treatment and for 4 months after completion of therapy with this agent.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding Considerations It is not known whether basiliximab is excreted in human milk. Because many immunoglobulins are secreted in milk and the potential for serious adverse reactions exists, a decision should be made whether to discontinue nursing or discontinue the drug, taking into account the importance of the drug to the mother.

Adverse Reactions Administration of basiliximab did not appear to increase the incidence or severity of adverse effects in clinical trials. Adverse events were reported in 96% of both the placebo and basiliximab groups.

>10%:

- Cardiovascular: Hypertension, peripheral edema
- Central nervous system: Fever, headache, insomnia, pain
- Dermatologic: Acne, wound complications
- Endocrine & metabolic: Hypercholesterolemia, hyperglycemia, hyper-/hypokalemia, hyperuricemia, hypophosphatemia
- Gastrointestinal: Abdominal pain, constipation, diarrhea, dyspepsia, nausea, vomiting
- Genitourinary: Urinary tract infection
- Hematologic: Anemia
- Neuromuscular & skeletal: Tremor
- Respiratory: Dyspnea, infection (upper respiratory)
- Miscellaneous: Viral infection

3% to 10%:

- Cardiovascular: Abnormal heart sounds, angina pectoris, arrhythmia, atrial fibrillation, cardiac failure, chest pain, generalized edema, hypotension, tachycardia
- Central nervous system: Agitation, anxiety, depression, dizziness, fatigue, hypoesthesia, malaise, neuropathy, rigors
- Dermatologic: Cyst, hypertrichosis, pruritus, rash, skin disorder, skin ulceration
- Endocrine & metabolic: Acidosis, dehydration, diabetes mellitus, fluid overload, hyper-/hypocalcemia, hyperlipidemia, hypertriglyceridemia, hypoglycemia, hypomagnesemia, hyponatremia
- Gastrointestinal: Abdomen enlarged, esophagitis, flatulence, gastroenteritis, GI hemorrhage, gingival hyperplasia, melena, moniliasis, stomatitis (including ulcerative), weight gain
- Genitourinary: Albuminuria, bladder disorder, dysuria, genital edema, hematuria, impotence, oliguria, renal function abnormal, renal tubular necrosis, ureteral disorder, urinary frequency, urinary retention
- Hematologic: Hematoma, hemorrhage, leukopenia, polycythemia, purpura, thrombocytopenia, thrombosis
- Neuromuscular & skeletal: Arthralgia, arthropathy, back pain, cramps, fracture, hernia, leg pain, myalgia, paresthesia, weakness
- Ocular: Abnormal vision, cataract, conjunctivitis
- Respiratory: Bronchitis, bronchospasm, cough, pharyngitis, pneumonia, pulmonary edema, sinusitis, rhinitis
- Miscellaneous: Accidental trauma, facial edema, glucocorticoids increased, herpes infection, sepsis

Postmarketing and/or case reports: Capillary leak syndrome, cytokine release syndrome; severe hypersensitivity reactions, including anaphylaxis, have been reported (symptoms may include hypotension, tachycardia, cardiac failure, dyspnea, bronchospasm, pulmonary edema, urticaria, rash, pruritus, sneezing, and respiratory failure)

Oncology: Vesicant No

Oncology: Emetic Potential Very low (<10%)

Drug Interactions

Abciximab: May enhance the potential for allergic or hypersensitivity reactions to Monoclonal Antibodies. Also may cause thrombocytopenia or diminished therapeutic effects. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions Herb/Nutraceutical: Echinacea may diminish the therapeutic effect of basiliximab. Avoid hypoglycemic herbs, including alfalfa, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng, gymnema, marshmallow, and stinging nettle (may enhance the hypoglycemic effect of basiliximab).

Monitoring ParametersSigns and symptoms of acute rejection

Nursing: Physical Assessment/MonitoringMonitor cardiorespiratory function, renal function, and adverse reactions during infusion and periodically following infusion. Be alert to opportunistic infections. Assess knowledge/teach patient possible side effects/interventions and adverse symptoms to report as inpatient or following discharge.

Patient EducationThis medication, which may help to reduce transplant rejection, can only be given by infusion. You will be monitored and assessed closely during infusion and thereafter. It is important that you report any changes or problems for evaluation. You will be susceptible to infection (avoid crowds and exposure to infection). Frequent mouth care and small frequent meals may help counteract any GI effects you may experience and will help maintain adequate nutrition and fluid intake. You may experience trouble sleeping or headaches. Report any changes in urination; unusual bruising or bleeding; chest pain or palpitations; acute dizziness; respiratory difficulty; fever or chills; changes in cognition; rash; feelings of pain or numbness in extremities; swelling of extremities; severe GI upset or diarrhea; unusual back or leg pain or muscle tremors; vision changes; or any sign of infection (eg, chills, fever, sore throat, easy bruising or bleeding, mouth sores, unhealed sores, vaginal discharge). **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Simulect®: 10 mg, 20 mg

Generic AvailableNo

ManufacturerNovartis Pharmaceuticals Corp

Mechanism of ActionChimeric (murine/human) monoclonal antibody which blocks the alpha-chain of the interleukin-2 (IL-2) receptor complex; this receptor is expressed on activated T lymphocytes and is a critical pathway for activating cell-mediated allograft rejection

Pharmacodynamics/Kinetics

Duration: Mean: 36 days (determined by IL-2R alpha saturation)

Distribution: Mean: V_d: Children 1-11 years: 4.8 ± 2.1 L; Adolescents 12-16 years: 7.8 ± 5.1 L; Adults: 8.6 ± 4.1 L

Half-life elimination: Children 1-11 years: 9.5 days; Adolescents 12-16 years: 9.1 days; Adults: Mean: 7.2 days

Excretion: Clearance: Children 1-11 years: 17 mL/hour; Adolescents 12-16 years: 31 mL/hour; Adults: Mean: 41 mL/hour

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Facial edema and ulcerative stomatitis. Causes gingival hypertrophy (GH) similar to that caused by cyclosporine; early reports indicate that frequency/incidence of basiliximab-induced GH not as high as cyclosporine-induced GH.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness, headache, and insomnia are common. May cause agitation, anxiety, depression, malaise, or fatigue.

Mental Health: Effects on Psychiatric TreatmentSide effects mimic depressive symptoms; effects of benzodiazepines and antidepressants may be altered

International Brand NamesSimulect (AR, AT, AU, BE, BG, BR, CH, CL, CN, CO, CZ, DE, DK, EC, ES, FI, FR, GB, GR, HK, HN, IE, IL, IT, KP, MX, MY, NL, NO, PE, PH, PK, PL, PT, PY, RU, SE, SG, TH, TR, TW, UY, VE)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(bee see jee vak SEEN)

U.S. Brand NamesTheraCys®; TICE® BCG

Canadian Brand NamesImmuCyst®; Oncotice™; Pacis™

Pharmacologic CategoryBiological Response Modulator; Vaccine

Use: Labeled IndicationsImmunization against tuberculosis and immunotherapy for cancer; treatment and prophylaxis of carcinoma *in situ* of the bladder; prophylaxis of primary or recurrent superficial papillary tumors following transurethral resection

Dosing: Adults

Immunization against tuberculosis: Percutaneous: 0.2-0.3 mL (full strength dilution); conduct postvaccinal tuberculin test (5 TU of PPD) in 2-3 months; if test is negative, repeat vaccination. **Note:** Initial lesion usually appears after 10-14 days consisting of small, red papule at injection site and reaches maximum diameter of 3 mm in 4-6 weeks.

Immunotherapy for bladder cancer: Intravesicular:

TheraCys®: One dose instilled into bladder (for 2 hours) once weekly for 6 weeks followed by one treatment at 3, 6, 12, 18, and 24 months after initial treatment.

TICE® BCG: One dose instilled into the bladder (for 2 hours) once weekly for 6 weeks followed by once monthly for 6-12 months.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Immunization against tuberculosis: Percutaneous:

Children <1 month: 0.2-0.3 mL (half-strength dilution). Administer tuberculin test (5 TU) after 2-3 months; repeat vaccination after 1 year of age for negative tuberculin test if indications persist. **Note:** Initial lesion usually appears after 10-14 days consisting of small, red papule at injection site and reaches maximum diameter of 3 mm in 4-6 weeks.

Children >1 month: Refer to adult dosing.

Administration: OtherShould only be given intravesicularly (bladder irrigation) or percutaneously; **do not administer I.V., SubQ, or intradermally**.

Intravesicular: Empty or drain bladder. Instill BCG vaccine; retain for up to 2 hours. Patient should lie prone, rotating positions every 15 minutes to maximize bladder surface exposure.

Percutaneous: Apply vaccine with syringe and needle by dropping onto 1-2 inch area of horizontally positioned surface of cleansed, dry site (deltoid region of arm preferred); pulling skin tight, puncture skin with multiple puncture device centered over the vaccine; apply pressure for 5 seconds; spread vaccine evenly over puncture area. Apply loose covering and keep dry for 24 hours.

StorageStore vials under refrigeration at 2°C to 8°C (36°F to 46°F); protect from light. Use within 2 hours of mixing.

Reconstitution

TheraCys®: Reconstitute with 3 mL of diluent provided and shake gently. Withdraw contents and add 50 mL of 0.9% NaCl (preservative free).

TICE® BCG: Reconstitute with 1 mL 0.9% NaCl (preservative free) using a 3 mL syringe. Mix by drawing and expelling solution into ampul three times. Add to a catheter tip syringe containing 49 mL of 0.9% NaCl (preservative free).

BCG Vaccine U.S.P.: Reconstitute with 1 mL of SWFI; swirl gently, do not vigorously shake. For children <1 month, reconstitute with 2 mL SWFI.

ContraindicationsHypersensitivity to BCG vaccine or any component of the formulation; immunocompromised state, HIV-infected, and burn patients; active tuberculosis; intravesicular BCG is contraindicated in febrile illness, urinary tract infection, gross hematuria and recent (<7-14 days) biopsy, transurethral resection (TUR), or traumatic catheterization

Warnings/Precautions

Boxed warnings:

- Hazardous agent: See “Special handling” below.
- Systemic reactions: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: **[U.S. Boxed Warning]: Use appropriate precautions for handling and disposal. BCG is a biohazardous agent; proper technique and disposal of all equipment in contact with BCG vaccine as a biohazardous material is recommended.** BCG infections have been reported in healthcare workers due to accidental exposure (needlestick, skin laceration); nosocomial infections have been reported in patients receiving parenteral medications prepared in areas where BCG vaccine was prepared. To avoid cross contamination, do not prepare parenteral medications in an area where BCG vaccine has been prepared.

Concerns related to adverse effects:

- Systemic reactions: **[U.S. Boxed Warning]: Systemic reactions have been reported in patients treated as immunotherapy for bladder cancer.**

Disease-related concerns:

- HIV: Should be administered with caution to persons in groups at high risk for HIV; although limited data suggest that the vaccine may be safe for use in asymptomatic children infected with HIV, BCG vaccination is not recommended for HIV-infected adults. HIV-infected persons thought to be infected with *Mycobacterium tuberculosis* should be strongly recommended for tuberculosis preventive therapy.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination.

- Pediatrics: Safety and efficacy of intravesicular BCG have not been established in children.

- Positive PPD reaction: BCG vaccination is not recommended for persons with a positive PPD reaction. Until further research can clearly define the risks and benefits of BCG vaccination for this population, vaccination should be restricted to persons at exceptionally high risk for tuberculosis infection.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have not been conducted. There are no adequate and well-controlled studies in pregnant women. Both intravesicular and percutaneous BCG vaccines are not recommended for use in pregnant women. Women of childbearing potential should be advised to avoid pregnancy while on therapy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions, breast-feeding is not recommended.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Adverse reactions associated with **intravesicular administration**:

>10%:

Central nervous system: Malaise (7% to 40%), fever (20% to 38%), chills (34%)

Gastrointestinal: Nausea/vomiting (3% to 16%), anorexia/weight loss (2% to 11%)

Genitourinary: Dysuria (52% to 60%), bladder irritation (50% to 60%), polyuria (40% to 42%), hematuria (26% to 39%), cystitis (6% to 29%), urinary urgency (6% to 18%), urinary tract infection (2% to 18%)

Hematological: Anemia (<1% to 21%)

Miscellaneous: Flu-like syndrome (33%)

1% to 10%:

Central nervous system: Fatigue (7%), headache/dizziness (2%)

Dermatologic: Rash (2%)

Gastrointestinal: Diarrhea (6%), abdominal pain (2% to 3%)

Genitourinary: Genital pain (10%), bladder cramps/pain (6%), urinary incontinence (2% to 6%), bladder spasm (5%), nocturia (5%), urinary debris (2%), genital inflammation/abscess (2%)

Hematological: Leukopenia (5%), coagulopathy (3%)

Neuromuscular & skeletal: Arthralgia/myalgia (3% to 7%), cramps/pain (4% to 6%), rigors (3%)

Renal: Renal toxicity (10%)

Respiratory: Pulmonary infection (3%)

Miscellaneous: Infection (3%), allergy (2%)

<1%: Abscesses, conjunctivitis, constipation, disseminated sepsis, epididymitis, granulomatous chorioretinitis, hepatitis, hepatic granuloma, keratitis, *M. bovis* infection (lung, liver, bone, bone marrow, kidney, lymph nodes, prostate), orchitis, pneumonitis, prostatitis, skin ulceration, thrombocytopenia, urethritis, urinary obstruction, uveitis

Adverse reactions associated with **BCG vaccination**: Axillary lymphadenopathy, cervical lymphadenopathy, disseminated BCG infection (BCG osteomyelitis), local reactions (induration, itching, lesions, lymphadenitis, pustule, tenderness, ulceration). Local reactions may persist for up to 3 months; more severe manifestations may occur up to 5 months after vaccination and persist for several weeks.

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

Immune Globulins: May diminish the therapeutic effect of Vaccines (Live). *Risk D: Consider therapy modification*

Immunosuppressants: May enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Tuberculin Tests: Vaccines (Live) may diminish the diagnostic effect of Tuberculin Tests. *Risk D: Consider therapy modification*

Test InteractionsPPD intradermal test; BCG vaccination results in reactive tuberculin skin test; rule out active tuberculosis prior to initiating intravesicular BCG treatment

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, intravesical [preservative free]:

TheraCys®: 81 mg [contains natural rubber/natural latex in packaging, polysorbate 80 (in diluent)]

TICE® BCG: 50 mg

Injection, powder for reconstitution, percutaneous [preservative free]:

BCG Vaccine: 50 mg

Generic AvailableNo

Mechanism of ActionBCG live is an attenuated strain of bacillus Calmette-Guérin (*Mycobacterium bovis*) used as a biological response modifier. BCG live, when used intravesicularly for treatment of bladder carcinoma *in situ*, is thought to cause a local, chronic inflammatory response involving macrophage and leukocyte infiltration of the bladder. By a mechanism not fully understood, this local inflammatory response leads to destruction of superficial tumor cells of the urothelium. BCG is active immunotherapy which stimulates the host's immune mechanism to reject the tumor. Evidence of systemic immune response is also commonly seen, manifested by a positive PPD tuberculin skin test reaction, however, its relationship to clinical efficacy is not well-established.

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsWhen used for immunization against tuberculosis, Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record. Multiple puncture device for vaccination available from Organon Tenika (1-800-662-6842).

BCG vaccination is not recommended by the CDC for general use in the U.S. for prevention of tuberculosis (TB).

BCG vaccination is recommended for infants and children with negative tuberculin skin tests who:

- are at high risk of intimate and prolonged exposure to persistently untreated or ineffectively treated patients with infectious pulmonary tuberculosis

- cannot be removed from the source of exposure

- cannot be placed on long-term preventive therapy

- are continuously exposed with tuberculosis who have bacilli resistant to isoniazid and rifampin

BCG vaccination is recommended for healthcare workers (HCW) in high-risk settings where:

- a high percentage of TB patients are infected with *M. tuberculosis* strains resistant to both isoniazid and rifampin

- transmission of drug-resistant *M. tuberculosis* strains and subsequent infection are likely

- comprehensive TB infection control precautions have been implemented yet have not been successful

BCG vaccination in not recommended for HCWs in low-risk settings.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Becaplermin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Becaplermin (Regranex®) Gel: New Boxed Warning (Associated With Increased Risk of Mortality From Cancer in Diabetic Patients) - June 2008

The Food and Drug Administration (FDA) has issued a follow-up Dear Healthcare professional letter regarding an earlier safety review of becaplermin, a recombinant human platelet-derived growth factor. In March, 2008 the FDA announced that it had received information from a retrospective study and was investigating the possibility of an increased risk of cancer and/or mortality from cancer in patients with diabetes who used becaplermin, compared to patients who did not use becaplermin. The FDA has completed its review of this study, suggesting an increased risk of mortality from cancer in patients who used ≥3 tubes of becaplermin gel. As a result, the becaplermin prescribing information has been updated to include a new boxed warning regarding this finding. It is important to note that while the study showed an increase in mortality from cancer, the number of mortalities were small, there was no overall increase in the incidence of cancer, and the observed malignancies were remote from the ulcer treatment site. The FDA recommends the use of becaplermin only when the potential benefits outweigh the risks.

For more information, see http://www.fda.gov/medwatch/safety/2008/safety08.htm#Regranex

Medication Safety Issues

Sound-alike/look-alike issues:

Regranex® may be confused with Granulex®, Repronex®

Pronunciation(be KAP ler min)

U.S. Brand NamesRegranex®

Canadian Brand NamesRegranex®

Pharmacologic CategoryGrowth Factor, Platelet-derived; Topical Skin Product

Use: Labeled IndicationsAdjunctive treatment of diabetic neuropathic ulcers occurring on the lower limbs and feet that extend into subcutaneous tissue (or beyond) and have adequate blood supply

Dosing: Adults**Diabetic ulcers (lower extremity):** Topical: Apply appropriate amount of gel once daily with a cotton swab or similar tool, as a coating over the ulcer. The amount of becaplermin to be applied will vary depending on the size of the ulcer area.

Note: If the ulcer does not decrease in size by ~30% after 10 weeks of treatment or complete healing has not occurred in 20 weeks, continued treatment with becaplermin gel should be reassessed.

Estimation of gel requirement: To calculate the length of gel applied to the ulcer, measure the greatest length of the ulcer by the greatest width of the ulcer. Tube size and unit of measure will determine the formula used in the calculation. Recalculate amount of gel needed every 1-2 weeks, depending on the rate of change in ulcer area.

Centimeters:

15 g tube: [ulcer length (cm) x width (cm)] divided by 4 = length of gel (cm)

2 g tube: [ulcer length (cm) x width (cm)] divided by 2 = length of gel (cm)

Inches:

15 g tube: [length (in) x width (in)] x 0.6 = length of gel (in)

2 g tube: [length (in) x width (in)] x 1.3 = length of gel (in)

Dosing: ElderlyRefer to adult dosing.

Administration: TopicalFor external use only. Squeeze appropriate amount of gel onto clean measuring surface (eg, wax paper), spread onto entire ulcer area in a thin, continuous layer ~$^{1}/_{16}$ inch thick. Cover with saline moistened dressing; leave dressing in place ~12 hours. After 12 hours, remove dressing, rinse with saline or water to remove residual becaplermin gel and cover with saline moistened dressing (without becaplermin gel) for remainder of the day. Continue use once daily until ulcer is completely healed.

StorageRefrigerate at 2°C to 8°C (36°F to 46°F); do not freeze.

ContraindicationsHypersensitivity to becaplermin or any component of the formulation; known neoplasm(s) at the site(s) of application

Warnings/Precautions

Boxed warnings:

- Malignancy: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Malignancy: **[U.S. Boxed Warning]: An increase in mortality secondary to systemic malignancies has been observed in a retrospective study of patients treated with ≥3 tubes of becaplermin.** Malignancies of varying types have been reported; all were remote from the becaplermin treatment site. Use with caution in patients with known malignancy.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <16 years of age.

Other warnings/precautions:

- Appropriate use: For external use only; do not use in wounds that close by primary intention. Use with caution in ulcer wounds related to arterial or venous insufficiency and when there are thermal, electrical, or radiation burns at wound site. Effects on exposed joints, tendons, ligaments and bone have not been established.

Geriatric ConsiderationsNo specific information for use in elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Use in pregnancy only if clearly needed.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

1% to 10%: Dermatologic: Erythematous rash (2%)

<1%: Erythema with purulent discharge, ulcer infection, tunneling of ulcer, exuberant granulation tissue, local pain, skin ulceration

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersUlcer volume (pressure ulcers); wound area; evidence of closure; drainage (diabetic ulcers); signs/symptoms of toxicity (erythema, local infections)
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gel, topical:

Regranex®: 0.01% (2 g, 15 g)

Generic AvailableNo
ManufacturerOrtho-McNeil Pharmaceutical, Inc
Pricing: U.S. (www.drugstore.com)

Gel (Regranex)

0.01% (15): $642.55

Mechanism of ActionRecombinant B-isoform homodimer of human platelet-derived growth factor (rPDGF-BB) which enhances formation of new granulation tissue, induces fibroblast proliferation and differentiation to promote wound healing; also promotes angiogenesis.
Pharmacodynamics/Kinetics

Onset of action: Complete healing: 15% of patients within 8 weeks, 25% at 10 weeks

Absorption: Minimal

Distribution: Binds to PDGF beta-receptors in normal skin and granulation tissue

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Beclomethasone

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Vanceril® may be confused with Vancenase®

Pronunciation(be kloe METH a sone)

U.S. Brand NamesBeconase® AQ; QVAR®

Canadian Brand NamesApo-Beclomethasone®; Gen-Beclo; Nu-Beclomethasone; Propaderm®; QVAR®; Rivanase AQ; Vanceril® AEM

Pharmacologic CategoryCorticosteroid, Inhalant (Oral); Corticosteroid, Nasal

Use: Labeled Indications

Oral inhalation: Maintenance and prophylactic treatment of asthma; includes those who require corticosteroids and those who may benefit from a dose reduction/elimination of systemically-administered corticosteroids. Not for relief of acute bronchospasm.

Nasal aerosol: Symptomatic treatment of seasonal or perennial rhinitis; prevent recurrence of nasal polyps following surgery.

Dosing: AdultsNasal inhalation and oral inhalation dosage forms are not to be used interchangeably.

Rhinitis, nasal polyps: Inhalation, nasal (Beconase® AQ): 1-2 inhalations each nostril twice daily; total dose 168-336 mcg/day

Asthma: Inhalation, oral (doses should be titrated to the lowest effective dose once asthma is controlled) (QVAR®):

Patients previously on bronchodilators only: Initial dose 40-80 mcg twice daily; maximum dose 320 mcg twice day

Patients previously on inhaled corticosteroids: Initial dose 40-160 mcg twice daily; maximum dose 320 mcg twice daily

NIH Asthma Guidelines (NIH, 2007): HFA formulation (eg, QVAR®): Administer in divided doses:

"Low" dose: 80-240 mcg/day

"Medium" dose: >240-480 mcg/day

"High" dose: >480 mcg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricNasal inhalation and oral inhalation dosage forms are not to be used interchangeably.

Rhinitis, nasal polyps: Inhalation, nasal (Beconase® AQ): Children ≥6 years: Refer to adult dosing

Asthma: Inhalation, oral (doses should be titrated to the lowest effective dose once asthma is controlled) (QVAR®):

Children 5-11 years: Initial: 40 mcg twice daily; maximum dose: 80 mcg twice daily

Children ≥12 years: Refer to adult dosing

NIH Asthma Guidelines (NIH, 2007): HFA formulation (eg, QVAR®): Administer in divided doses:

Children 5-11 years:

"Low" dose: 80-160 mcg/day

"Medium" dose: >160-320 mcg/day

"High" dose: >320 mcg/day

Children ≥12 years: Refer to adult dosing.

Administration: Inhalation

Beconase AQ®: Shake well before use. Nasal applicator and dust cap may be washed in warm water and dry thoroughly.

QVAR®: Rinse mouth and throat after use to prevent *Candida* infection. Do not wash or put inhaler in water; mouth piece may be cleaned with a dry tissue or cloth. Prime canister before using.

StorageDo not store near heat or open flame. Do not puncture canisters. Store at room temperature. Rest QVAR® on concave end of canister with actuator on top.

ContraindicationsHypersensitivity to beclomethasone or any component of the formulation; status asthmaticus

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections.

- Bronchospasm: May occur with wheezing after inhalation; if this occurs stop steroid and treat with a fast-acting bronchodilator.

- Delayed wound healing: Avoid nasal corticosteroid use in patients with recent nasal septal ulcers, nasal surgery or nasal trauma until healing has occurred.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox should be avoided; corticosteroids should not be used to treat ocular herpes simplex. Corticosteroids should not be used for cerebral malaria. Close observation is required in patients with latent tuberculosis and/or TB reactivity; restrict use in active TB (only in conjunction with antituberculosis treatment).

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Psychiatric disturbances: Corticosteroid use may cause psychiatric disturbances, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

Disease-related concerns:

- Asthma: Supplemental steroids (oral or parenteral) may be needed during stress or severe asthma attacks. Not to be used in status asthmaticus or for the relief of acute bronchospasm.

- Cardiovascular disease: Use with caution in patients with HF; long-term use has been associated with fluid retention and hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose production/regulation leading to hyperglycemia.

- Gastrointestinal disease: Use with caution in patients with GI diseases (diverticulitis, peptic ulcer, ulcerative colitis) due to perforation risk.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; long-term use has been associated with fluid retention.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms has occurred especially during initial treatment with corticosteroids.

- Myocardial infarct (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Renal impairment: Use with caution in patients with renal impairment; fluid retention may occur.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Pediatrics: Orally-inhaled and intranasal corticosteroids may cause a reduction in growth velocity in pediatric patients (~1 centimeter per year [range 0.3-1.8 cm per year] and related to dose and duration of exposure). To minimize the systemic effects of orally-inhaled and intranasal corticosteroids, each patient should be titrated to the lowest effective dose. Growth should be routinely monitored in pediatric patients. Safety and efficacy have not been established in children <5 years of age.

Other warnings/precautions:

- Discontinuation of therapy: Withdraw systemic therapy with gradual tapering of dose. There have been reports of systemic corticosteroid withdrawal symptoms (eg, joint/muscle pain, lassitude, depression) when withdrawing oral inhalation therapy.

Geriatric ConsiderationsElderly patients may have difficulty with oral metered dose inhalers and may benefit from the use of a spacer or chamber device.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were observed in animal studies. No human data on beclomethasone crossing the placenta or effects on the fetus. A decrease in fetal growth has not been observed with inhaled corticosteroid use during pregnancy. Inhaled corticosteroids are recommended for the treatment of asthma (most information available using budesonide) and allergic rhinitis during pregnancy.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsOther corticosteroids have been found in breast milk; however, information for beclomethasone is not available. Inhaled corticosteroids are recommended for the treatment of asthma (most information available using budesonide) while breast-feeding.

Adverse ReactionsFrequency not defined.

Central nervous system: Agitation, depression, dizziness, dysphonia, headache, lightheadedness, mental disturbances

Dermatologic: Acneiform lesions, angioedema, atrophy, bruising, pruritus, purpura, striae, rash, urticaria

Endocrine & metabolic: Cushingoid features, growth velocity reduction in children and adolescents, HPA function suppression, weight gain

Gastrointestinal: Dry/irritated nose, throat and mouth, hoarseness, localized *Candida* or *Aspergillus* infection, loss of smell, loss of taste, nausea, unpleasant smell, unpleasant taste, vomiting

Local: Nasal spray: Burning, epistaxis, localized *Candida* infection, nasal septum perforation (rare), nasal stuffiness, nosebleeds, rhinorrhea, sneezing, transient irritation, ulceration of nasal mucosa (rare)

Ocular: Cataracts, glaucoma, intraocular pressure increased

Respiratory: Cough, paradoxical bronchospasm, pharyngitis, sinusitis, wheezing

Miscellaneous: Anaphylactic/anaphylactoid reactions, death (due to adrenal insufficiency, reported during and after transfer from systemic corticosteroids to aerosol in asthmatic patients), immediate and delayed hypersensitivity reactions

Drug Interactions

Amphotericin B: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antidiabetic Agents: Corticosteroids (Orally Inhaled) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringNot to be used to treat status asthmaticus or fungal infections of nasal passages. Monitor therapeutic effectiveness and adverse reactions. When changing from systemic steroids to inhalational steroids, taper reduction of systemic medication slowly. Growth should be routinely monitored in pediatric patients. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationUse as directed; do not increase dosage or discontinue abruptly without consulting prescriber. It may take 1-4 weeks for you to realize full effects of treatment. Review use of inhaler or spray with prescriber or follow package insert for directions. Keep oral inhaler clean and unobstructed. Always rinse mouth and throat after use of inhaler to prevent infection. If you are also using an inhaled bronchodilator, wait 10 minutes before using this steroid aerosol. Report adverse effects such as skin redness, rash, or irritation; pain or burning of nasal mucosa; white plaques in mouth or fuzzy tongue; unresolved headache; or worsening of condition or lack of improvement. Discard after date calculated by prescriber; the amount of medication in canister cannot be guaranteed after using the labeled number of actuations (sprays) even though it may not feel empty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Inhalation: Sit when using. Take deep breaths for 3-5 minutes, and clear nasal passages before administration (use decongestant as needed). Hold breath for 5-10 seconds after use, and wait 1-3 minutes between inhalations. Follow package insert instructions for use. Do not exceed maximum dosage. If also using inhaled bronchodilator, use before beclomethasone. Rinse mouth and throat after use to reduce aftertaste and prevent candidiasis.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol for oral inhalation, as dipropionate:

QVAR®: 40 mcg/inhalation [100 metered actuations] (7.3 g); 80 mcg/inhalation [100 metered actuations] (7.3 g)

Suspension, intranasal, as dipropionate [aqueous spray]:

Beconase® AQ: 42 mcg/inhalation [180 metered sprays (25 g)

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Aerosol solution (Qvar)

40 mcg/ACT (7.3): $75.59

80 mcg/ACT (7.3): $92.87

Suspension (Beconase AQ)

42 mcg/spray (25): $149.32

Mechanism of Action Controls the rate of protein synthesis; depresses the migration of polymorphonuclear leukocytes, fibroblasts; reverses capillary permeability and lysosomal stabilization at the cellular level to prevent or control inflammation

Pharmacodynamics/Kinetics

Onset of action: Therapeutic effect: 1-4 weeks

Absorption: Readily; quickly hydrolyzed by pulmonary esterases prior to absorption

Distribution: Beclomethasone: 20 L; active metabolite: 424 L

Protein binding: 87%

Metabolism: Hepatic via CYP3A4 to active metabolites

Bioavailability: Of active metabolite, 44% following nasal inhalation (43% from swallowed portion)

Half-life elimination: Initial: 3 hours

Excretion: Feces (60%); urine (12%)

Related Information

- Asthma
- Inhalant Agents
- Status Epilepticus

Pharmacotherapy Pearls Effects of inhaled/intranasal steroids on growth have been observed in the absence of laboratory evidence of HPA axis suppression, suggesting that growth velocity is a more sensitive indicator of systemic corticosteroid exposure in pediatric patients than some commonly used tests of HPA axis function. The long-term effects of this reduction in growth velocity associated with orally-inhaled and intranasal corticosteroids, including the impact on final adult height, are unknown. The potential for “catch up” growth following discontinuation of treatment with inhaled corticosteroids has not been adequately studied.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Oral candidiasis, xerostomia (normal salivary flow resumes upon discontinuation), nasal dryness, and dry throat. Localized infections with *Candida albicans* or *Aspergillus niger* occur frequently in the mouth and pharynx with repetitive use of an oral inhaler; may require treatment with appropriate antifungal therapy or discontinuance of inhaler use.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause agitation, depression, dizziness, euphoria, insomnia, mood swings, and personality changes; may cause exacerbation of pre-existing psychiatric conditions

Mental Health: Effects on Psychiatric Treatment None reported

Anesthesia and Critical Care Concerns/Other Considerations

Surgery: For patients who have received oral systemic corticosteroids during the past 6 months and for selected patients on long-term, high-dose, inhaled corticosteroid (ICS), give stress doses of hydrocortisone intravenously during the surgical period and reduce the dose rapidly within 24 hours after surgery (Expert Panel Report 3, 2007). Clinically important adrenal suppression has been reported in patients receiving high doses of an ICS, particularly children.

Belladonna and Opium

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(bel a DON a & OH pee um)

U.S. Brand NamesB&O Supprettes® [DSC]

Pharmacologic CategoryAnalgesic Combination (Opioid); Antispasmodic Agent, Urinary

Use: Labeled IndicationsRelief of moderate-to-severe pain associated with ureteral spasms not responsive to nonopioid analgesics and to space intervals between injections of opiates

Dosing: AdultsPain: Rectal: 1 suppository 1-2 times/day, up to 4 doses/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricPain: Children >12 years: Refer to adult dosing.

Administration: OtherPrior to rectal insertion, the finger and suppository should be moistened. Assist with ambulation.

StorageStore at 15°C to 30°C. Do not refrigerate.

RestrictionsC-II

ContraindicationsHypersensitivity to belladonna, opium, or any component of the formulation; glaucoma; severe renal or hepatic disease; bronchial asthma; respiratory depression; convulsive disorders; acute alcoholism; premature labor

Allergy Considerations

- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Atropine idiosyncrasy: Use with caution in patients with known idiosyncrasy to atropine or atropine-like compounds.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene-derivative opioid agonists (codeine, hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Drug abuse: Use with caution in patients with a history of opiate drug abuse or acute alcoholism; potential for drug dependency exists.
- Increased intracranial pressure: Use with caution in patients with increased intracranial pressure; exaggerated elevation of ICP may occur.
- Prostatic hyperplasia: Use with caution in patients with prostatic hyperplasia; may cause urinary retention.
- Psychosis: Use with caution in patients with toxic psychosis; may exacerbate condition.
- Thyroid dysfunction: Use with caution in patients with myxedema; may exacerbate condition.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Not recommended for use in children ≤12 years of age.

Other warnings/precautions:

- Appropriate use: Usual precautions of opiate agonist therapy should be observed.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this product. Refer to Atropine and Morphine Sulfate monographs for additional information.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if/how much morphine or atropine may be found in breast milk following rectal administration of this product. Refer to Atropine and Morphine Sulfate monographs for additional information.

Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation

Central nervous system: Dizziness, drowsiness

Dermatologic: Pruritus, urticaria

Gastrointestinal: Constipation, nausea, vomiting, xerostomia

Genitourinary: Urinary retention

Ocular: Blurred vision, photophobia

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase sedation).

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for additive or adverse interactions. Monitor therapeutic effectiveness, signs of overdose, and adverse effects at beginning of therapy and at regular intervals with long-term use. May cause physical and/or psychological dependence. For inpatients, implement safety measures. Assess knowledge/teach patient appropriate use if self-administered. Teach patient to monitor for adverse reactions, adverse reactions to report, and appropriate interventions to reduce side effects.

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause hypotension, dizziness, or drowsiness; use caution when driving, climbing stairs, or changing position (rising from sitting or lying to standing) or when engaging in tasks requiring alertness (until response to drug is known); dry mouth or throat (frequent mouth care, frequent sips of fluids, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help; if unresolved, consult prescriber about use of stool softeners); photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); or decreased perspiration (avoid extremes in temperature or excessive activity in hot environments). Report chest pain or palpitations; persistent dizziness; changes in mentation; changes in gait; blurred vision; shortness of breath or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Suppository: Belladonna extract 16.2 mg and opium 30 mg; belladonna extract 16.2 mg and opium 60 mg

B&O Supprettes® #15 A: Belladonna extract 16.2 mg and opium 30 mg [DSC]

B&O Supprettes® #16 A: Belladonna extract 16.2 mg and opium 60 mg [DSC]

Generic AvailableYes

Mechanism of ActionThe pharmacologically active agents present in the belladonna component are atropine and scopolamine. Atropine blocks the action of acetylcholine at parasympathetic sites in smooth muscle, secretory glands, and the CNS causing a relaxation of smooth muscle and drying of secretions. The principle agent in opium is morphine. Morphine binds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain.

Pharmacodynamics/Kinetics Absorption: Rectal absorption is dependent upon body hydration, not temperature

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), and dry throat and nose.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment Constipation and dry mouth are common; use with low potency antipsychotics and TCAs will likely result in additive effects

Index Terms Opium and Belladonna

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(bel a DON a, fee noe BAR bi tal, & er GOT a meen)

U.S. Brand NamesBellamine S [DSC]; Eperbel-S [DSC]; Spastrin® [DSC]

Canadian Brand NamesBellergal® Spacetabs®

Pharmacologic CategoryErgot Derivative

Use: Labeled IndicationsManagement and treatment of menopausal disorders, GI disorders, and recurrent throbbing headache

Dosing: AdultsMenopausal disorders, GI disorders, and recurrent throbbing headache: Oral: 1 tablet each morning and evening

Dosing: ElderlyRefer to adult dosing and dosing in individual monographs.

ContraindicationsHypersensitivity to belladonna alkaloids, phenobarbital, ergotamine, or any component of the formulation; dopamine therapy; ergot alkaloids are contraindicated with potent inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics); hypertension; glaucoma; coronary heart disease and peripheral vascular disease; impaired hepatic or renal function; sepsis; history of manifest or latent porphyria; pregnancy

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity
- Belladonna Alkaloid Allergy
- Ergot Alkaloid Allergy

Warnings/Precautions

Boxed warnings:

- CYP3A4 inhibitors: See “Concurrent drug therapy issues” below.

Concerns related to adverse effects:

- Cardiac valvular fibrosis: Ergot alkaloids have been associated with fibrotic valve thickening (eg, aortic, mitral, tricuspid); usually associated with long-term, chronic use.
- Cardiovascular effects: Vasospasm or vasoconstriction can occur, possibly resulting in decreased cerebral blood flow, ECG changes, and hypertension; sustained vasoconstriction may also lead to ischemic colitis, intermittent claudication, aggravation of angina, or precipitation of MI. Do not use is any patient at risk or predisposed to vascular effects of ergot alkaloids.
- Ergotism: Ergot alkaloid use may result in ergotism (intense vasoconstriction) resulting in peripheral vascular ischemia and possible gangrene. Ergotism is usually associated with overdosage or prolonged chronic use; do not exceed dosing guidelines and avoid prolonged administration.
- Habit-forming: May be habit-forming.
- Pleural/retroperitoneal fibrosis: Rare cases of pleural and/or retroperitoneal fibrosis have been reported with prolonged daily use.

Disease-related concerns:

- Asthma: Use with caution in patients with bronchial asthma.
- Uropathy: Use with caution in patients with obstructive uropathy.

Concurrent drug therapy issues:

- CYP3A4 inhibitors: **[U.S. Boxed Warning]: Ergot alkaloids are contraindicated with potent inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics); concomitant use associated with acute ergot toxicity (ergotism).**

Special populations:

- Elderly: Use with extreme caution or avoid use in the elderly; due to vasoconstrictive properties and cardiovascular adverse effects associated with ergot alkaloids.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Weekly dosage: Total weekly dosage of ergotamine should not exceed 10 mg.
- Withdrawal: Discontinuation after extended use may result in withdrawal symptoms (eg, rebound headache).

Pregnancy Risk FactorX

Pregnancy ConsiderationsPotential uterotonic effects

LactationEnters breast milk (ergotamine)/contraindicated

Adverse Reactions

>10%:

Cardiovascular: Peripheral vascular effects (numbness and tingling of fingers and toes)

Central nervous system: Drowsiness, dizziness

Dermatologic: Dry skin

Gastrointestinal: Constipation, dry mouth and throat, diarrhea, nausea, vomiting

Respiratory: Dry nose

Miscellaneous: Diaphoresis decreased

1% to 10%:

Cardiovascular: Precordial distress and pain, transient tachycardia or bradycardia

Dermatologic: Photosensitivity

Endocrine & metabolic: Breast milk flow decreased

Gastrointestinal: Swallowing difficulty

Neuromuscular & skeletal: Muscle pain in extremities, weakness in legs

<1% (Limited to important or life-threatening): Orthostatic hypotension, ventricular fibrillation, tachycardia, palpitation, confusion, headache, memory loss, drowsiness, skin rash, intraocular pain increased, blurred vision

Metabolism/Transport Effects

Phenobarbital: **Substrate** of CYP2C8/9 (minor), 2C19 (major), 2E1 (minor); **Induces** CYP1A2 (strong), 2A6 (strong), 2B6 (strong), 2C8/9 (strong), 3A4 (strong)

Ergotamine: **Substrate** of CYP3A4 (major); Inhibits 3A4 (weak)

Drug Interactions

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Aminocamptothecin: PHENobarbital may decrease the serum concentration of Aminocamptothecin. *Risk C: Monitor therapy*

Amphetamines: May decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Bendamustine: CYP1A2 Inducers (Strong) may decrease the serum concentration of Bendamustine. Concentrations of active metabolites may be increased. *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May enhance the adverse/toxic effect of Anticonvulsants (Barbiturate). Specifically, osteomalacia and rickets. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inducers (Strong) may increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2A6 Substrates: CYP2A6 Inducers (Strong) may increase the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inducers (Strong) may increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inducers (Highly Effective) may increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inducers (Highly Effective) may increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Darunavir: PHENobarbital may decrease the serum concentration of Darunavir. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Efavirenz: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically, the risk for peripheral vasospasm and ischemia may be increased. *Risk X: Avoid combination*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Etravirine: PHENobarbital may decrease the serum concentration of Etravirine. Management: The manufacturer of etravirine states these drugs should not be used in combination *Risk X: Avoid combination*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

Folic Acid: May decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Griseofulvin: Barbiturates may decrease the absorption of Griseofulvin. *Risk D: Consider therapy modification*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Lacosamide: PHENobarbital may decrease the serum concentration of Lacosamide. *Risk C: Monitor therapy*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Leucovorin-Levoleucovorin: May decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Macrolide Antibiotics: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically leading the development of ergotism. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Methylfolate: May decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

OXcarbazepine: PHENobarbital may decrease the serum concentration of OXcarbazepine. *Risk C: Monitor therapy*

Posaconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Ergot Derivatives. *Risk X: Avoid combination*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Rufinamide: May increase the serum concentration of PHENobarbital. PHENobarbital may decrease the serum concentration of Rufinamide. *Risk C: Monitor therapy*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Serotonin 5-HT1D Receptor Agonists: Ergot Derivatives may enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Ergot Derivatives. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tipranavir: PHENobarbital may decrease the serum concentration of Tipranavir. Tipranavir may decrease the serum concentration of PHENobarbital. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Voriconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Voriconazole: Barbiturates may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, warfarin). This combination drug interacts with many commonly prescribed drugs to potentiate adverse/toxic reactions or to reduce the effectiveness of other drugs. Use caution with prolonged use; may be habit-forming. Abrupt discontinuation after long-term use may result in withdrawal symptoms (eg, rebound headache). Assess therapeutic effect and adverse reactions at regular intervals during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to females of childbearing age unless they are capable of complying with contraceptive use. Instruct patient about appropriate contraceptives.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed; do not take more than recommended dose. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake and nutrition. May cause drowsiness or dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known); dry throat or mouth (frequent mouth care or sucking on lozenges may help); dry nose (use humidifier); photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); nausea or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); dry skin (mild skin lotion may help); or orthostatic hypotension (use caution when rising from sitting or lying position or climbing stairs). Report any signs of numbness in extremities (fingers and toes); unusual leg pain or cyanosis of extremities; difficulty swallowing; persistent muscle pain or weakness; pain in eye or vision changes; or chest pain, rapid heartbeat, or palpitations. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant and do not get pregnant during therapy. Consult prescriber for instruction on appropriate contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet:

Bellamie S [DSC], Eperbel-S [DSC], Spastrin® [DSC]: Belladonna alkaloids 0.2 mg, phenobarbital 40 mg, and ergotamine 0.6 mg

Generic AvailableYes

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ben AY ze pril & hye droe klor oh THYE a zide)

U.S. Brand NamesLotensin® HCT

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension

Dosing: AdultsHypertension: Oral: Dose is individualized (range: benazepril: 5-20 mg; hydrochlorothiazide: 6.25-25 mg/day)

Dosing: ElderlyDose is individualized.

Dosing: Renal ImpairmentCl$_{cr}$ <30 mL/minute: Not recommended; loop diuretics are preferred.

Calculations

- Creatinine Clearance: Adults

ContraindicationsHypersensitivity to benazepril, any other ACE inhibitor, hydrochlorothiazide, sulfonamide-derived drugs, or any component of the formulation; anuria

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema or previous angioedema associated with ACE inhibitor therapy may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Electrolyte disturbances: Hyperkalemia may occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE Inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.
- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.
- Collagen vascular disease: Use benazepril with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity. Hydrochlorothiazide can cause systemic lupus erythematosus (SLE) exacerbation or activation.
- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control. Use benazepril with caution in patients with diabetes receiving insulin or oral antidiabetic agents; may be at increased risk for episodes of hypoglycemia.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.
- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.
- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.
- Porphyria: Use with caution in patients with porphyria; acute porphyritic attacks have occurred with hydrochlorothiazide.
- Renal artery stenosis: Use benazepril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.
- Renal impairment: Use ACE inhibitors with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment. Avoid hydrochlorothiazide in severe renal disease (ineffective). Contraindicated in anuric patients.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsIn clinical studies, of the total number of patients who received Lotensin® HCT in U.S., 19% were ≥65 years of age, while ~1.5% were ≥75 years. Overall differences in effectiveness or safety were not observed between these patients and younger patients, and other reported clinical experience has not identified differences in responses between elderly and younger patients, but greater sensitivity of some older individuals cannot be ruled out.
Pregnancy Risk FactorC/D (2nd and 3rd trimesters)
Pregnancy ConsiderationsSee individual agents.
LactationEnters breast milk/compatible
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsSee individual agents.
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure; BUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsBUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationSee individual agents.

Medication Safety Issues

Sound-alike/look-alike issues:

Benazepril may be confused with Benadryl®

Lotensin® may be confused with Lioresal®, lovastatin

International issues:

Lotensin® may be confused with Latensin® which is a brand name for bacillus cereus in Germany

Pronunciation(ben AY ze pril)

U.S. Brand NamesLotensin®

Canadian Brand NamesApo-Benazepril®; Lotensin®

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor

Use: Labeled IndicationsTreatment of hypertension, either alone or in combination with other antihypertensive agents

Dosing: AdultsHypertension: Oral: Initial: 10 mg/day in patients not receiving a diuretic; 20-80 mg/day as a single dose or 2 divided doses; the need for twice-daily dosing should be assessed by monitoring peak (2-6 hours after dosing) and trough responses.

Note: Patients taking diuretics should have them discontinued 2-3 days prior to starting benazepril. If they cannot be discontinued, then initial dose should be 5 mg; restart after blood pressure is stabilized if needed.

Dosing: ElderlyOral: Initial: 5-10 mg/day in single or divided doses; usual range: 20-40 mg/day; adjust for renal function. Also see “Note” in adult dosing.

Dosing: PediatricHypertension: Children ≥6 years: Oral: Initial: 0.2 mg/kg/day (up to 10 mg/day) as monotherapy; dosing range: 0.1-0.6 mg/kg/day (maximum dose: 40 mg/day)

Dosing: Renal Impairment

Cl_{cr} <30 mL/minute:

Children: Use is not recommended.

Adults: Administer 5 mg/day initially; maximum daily dose: 40 mg.

Hemodialysis: Moderately dialyzable (20% to 50%); administer dose postdialysis or administer 25% to 35% supplemental dose.

Peritoneal dialysis: Supplemental dose is not necessary.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Extemporaneously PreparedTo prepare a 2 mg/mL suspension, mix 15 benazepril 20 mg tablets in a bottle with Ora-Plus® 75 mL. Shake for 2 minutes, allow suspension to stand for ≥1 hour, then shake again for at least 1 additional minute. Add Ora-Sweet® 75 mL to suspension and shake to disperse. Will make 150 mL of a 2 mg/mL suspension. Store under refrigeration at 2°C to 8°C (36°F to 46°F) for up to 30 days. Shake prior to each use.

ContraindicationsHypersensitivity to benazepril or any component of the formulation; angioedema or serious hypersensitivity related to previous treatment with an ACE inhibitor

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE Inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.

- Diabetes: Use with caution in patients with diabetes receiving insulin or oral antidiabetic agents; may be at increased risk for episodes of hypoglycemia.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss, or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsDue to frequent decreases in glomerular filtration (also Cl_{cr}) with aging, elderly patients may have exaggerated responses to ACE inhibitors; differences in clinical response due to hepatic changes are not observed. ACE inhibitors may be preferred agents in elderly patients with congestive heart failure and diabetes mellitus. Diabetic proteinuria is reduced and insulin sensitivity is enhanced. In general, the side effect profile is favorable in elderly and causes little or no CNS confusion; use lowest dose recommendations initially. Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.

Benazepril and benazeprilat are substantially excreted by the kidney. Because elderly are more likely to have decreased renal function, care should be taken in dose selection, and it may be useful to monitor renal function.

Pregnancy Risk FactorD

Pregnancy ConsiderationsDue to adverse events observed in humans, benazepril is considered pregnancy category D. Benazepril crosses the placenta. First trimester exposure to ACE inhibitors may cause major congenital malformations. An increased risk of cardiovascular and/or central nervous system malformations was observed in one study; however, an increased risk of teratogenic events was not observed in other studies. Second and third trimester use of an ACE inhibitor is associated with oligohydramnios. Oligohydramnios due to decreased fetal renal function may lead to fetal limb contractures, craniofacial deformation, and hypoplastic lung development. The use of ACE inhibitors during the second and third trimesters is also associated with anuria, hypotension, renal failure (reversible or irreversible), skull hypoplasia, and death in the fetus/neonate. Chronic maternal hypertension itself is also associated with adverse events in the fetus/infant. ACE inhibitors are not recommended during pregnancy to treat maternal hypertension or heart failure. Those who are planning a pregnancy should be considered for other medication options if an ACE inhibitor is currently prescribed or the ACE inhibitor should be discontinued as soon as possible once pregnancy is detected. The exposed fetus should be monitored for fetal growth, amniotic fluid volume, and organ formation. Infants exposed to an ACE inhibitor *in utero*, especially during the second and third trimester, should be monitored for hyperkalemia, hypotension, and oliguria.

[U.S. Boxed Warning]: Based on human data, ACE inhibitors can cause injury and death to the developing fetus. ACE inhibitors should be discontinued as soon as possible once pregnancy is detected.

LactationEnters breast milk

Breast-Feeding ConsiderationsSmall amounts of benazepril and benazeprilat are found in breast milk.

Pregnancy & Lactation, In-Depth

- Benazepril in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Cardiovascular: Postural dizziness (2%)

Central nervous system: Headache (6%), dizziness (4%), fatigue (2%), somnolence (2%)

Gastrointestinal: Nausea (1%)

Renal: Serum creatinine increased (2%), worsening of renal function may occur in patients with bilateral renal artery stenosis or hypovolemia

Respiratory: Cough (1% to 10%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Agranulocytosis, alopecia, anaphylactoid reaction, angina, angioedema (includes head, neck and intestinal angioedema), arthralgia, arthritis, asthma, BUN increased (transient), dermatitis, dyspnea, ECG changes, eosinophilia, flushing, gastritis, hemolytic anemia, hyperbilirubinemia, hyperglycemia, hyperkalemia, hypersensitivity, hypertonia, hyponatremia, hypotension, impotence, insomnia, leukopenia, myalgia, neutropenia, palpitations, pancreatitis, paresthesia, pemphigus, peripheral edema, photosensitivity, postural hypotension, proteinuria, pruritis, rash, shock, Stevens-Johnson syndrome, syncope, thrombocytopenia, transaminases increased, uric acid increased, vomiting

Eosinophilic pneumonitis, anaphylaxis, renal insufficiency, and renal failure have been reported with other ACE inhibitors. In addition, a syndrome including fever, myalgia, arthralgia, interstitial nephritis, vasculitis, rash, eosinophilia, and elevated ESR has been reported to be associated with ACE inhibitors.

Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure; serum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions. Assess results of laboratory tests, therapeutic effectiveness (blood pressure should be monitored after first doses and periodically during therapy), and adverse response on a regular basis during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take exactly as directed; do not alter dose or discontinue drug without consulting prescriber. Take first dose at bedtime. Do not take potassium supplements or salt substitutes containing potassium without consulting prescriber. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); nausea, vomiting, abdominal pain, dry mouth, or transient loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); report if these side effects persist. Report mouth sores; fever or chills; swelling of extremities, face, mouth, or tongue; respiratory difficulty or unusual cough; or other persistent adverse reactions. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 5 mg, 10 mg, 20 mg, 40 mg

Lotensin®: 5 mg, 10 mg, 20 mg, 40 mg

Generic AvailableYes

ManufacturerNovartis Pharmaceuticals Corp

Pricing: U.S. (www.drugstore.com)

Tablets (Benazepril HCl)

5 mg (90): $64.97

10 mg (30): $23.99

20 mg (30): $23.99

40 mg (30): $23.99

Tablets (Lotensin)

5 mg (30): $51.99

10 mg (30): $51.99

20 mg (30): $51.99

40 mg (30): $51.99

Mechanism of ActionCompetitive inhibition of angiotensin I being converted to angiotensin II, a potent vasoconstrictor, through the angiotensin I-converting enzyme (ACE) activity, with resultant lower levels of angiotensin II which causes an increase in plasma renin activity and a reduction in aldosterone secretion

Pharmacodynamics/Kinetics

Reduction in plasma angiotensin-converting enzyme (ACE) activity:

Onset of action: Peak effect: 1-2 hours after 2-20 mg dose

Duration: >90% inhibition for 24 hours after 5-20 mg dose

Reduction in blood pressure:

Peak effect: Single dose: 2-4 hours; Continuous therapy: 2 weeks

Absorption: Rapid (37%); food does not alter significantly; metabolite (benazeprilat) itself unsuitable for oral administration due to poor absorption

Distribution: V_d: ~8.7 L

Protein binding:

Benazepril: ~97%

Benazeprilat: ~95%

Metabolism: Rapidly and extensively hepatic to its active metabolite, benazeprilat, via enzymatic hydrolysis; extensive first-pass effect

Half-life elimination: Benazeprilat: Effective: 10-11 hours; Terminal: Children: 5 hours, Adults: 22 hours

Time to peak: Parent drug: 0.5-1 hour

Excretion:

Urine (trace amounts as benazepril; 20% as benazeprilat; 12% as other metabolites)

Clearance: Nonrenal clearance (ie, biliary, metabolic) appears to contribute to the elimination of benazeprilat (11% to 12%), particularly patients with severe renal impairment; hepatic clearance is the main elimination route of unchanged benazepril

Dialysis: ~6% of metabolite removed within 4 hours of dialysis following 10 mg of benazepril administered 2 hours prior to procedure; parent compound not found in dialysate

Related Information

- Angiotensin Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentMay decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Congestive Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines recommend that ACE inhibitors be used in patients with a reduced EF (with or without heart failure symptoms) unless contraindicated. ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. In this situation, they decrease hospitalizations for, and retard progression to, congestive heart failure. When used in patients with heart failure, the target dose should be achieved, if possible. Lower daily doses of ACE inhibitors have demonstrated the same mortality effects as high doses, but have not decreased hospitalizations to the extent that high-dose ACE inhibitors have, as demonstrated in the ATLAS study (Packer M, 1999).

Hypertension: The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, and chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors or angiotensin receptor blockers (ARBs) can be beneficial in patients with hypertension and LVH without symptoms of heart failure. JNC 7 suggests that patients can benefit from treatment with an ACE inhibitor if they have hypertension **and** heart failure, acute myocardial infarction, high coronary disease risk, diabetes, chronic kidney disease, or history of stroke.

Vascular Disease: The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors can be useful in preventing heart failure in patients who have a history of atherosclerotic vascular disease, diabetes, or hypertension with associated cardiovascular risk factors. The HOPE trial (Heart Outcomes Prevention Evaluation Study Investigators, 2000) investigated the value of an ACE inhibitor (ramipril 5-10 mg daily) versus placebo in patients who had evidence of vascular disease or diabetes (one other cardiovascular risk factor) and were at least 55 years of age. Patients were excluded if they had a low ejection fraction, heart failure, or were on an ACE inhibitor. The primary outcome was a composite of death from cardiovascular cause, myocardial infarction, or stroke; 9297 patients were enrolled and randomized. Ramipril significantly reduced the risk of death from CV causes, MI, or stroke over placebo. New cases of diabetes were also reduced in the ramipril group. In the EUROPA trial, patients with stable coronary artery disease (at low-risk for cardiovascular events) received perindopril or placebo and were evaluated for incidence of cardiovascular events after 4 years of treatment. In this randomized, placebo-controlled, prospective study, 12,218 patients received either perindopril (8 mg/day, n=6110) or placebo (n=6108) and were assessed for the primary endpoint of a cardiovascular event, defined as cardiovascular death, myocardial infarction, or cardiac arrest. The study population was well balanced with respect to baseline demographics and concomitant medication use (including beta-blockers, platelet inhibitors, antihyperlipidemics, calcium channel blockers, nitrates, and diuretics). Intent-to-treat analysis revealed that 603 (10%) of placebo patients experienced the primary endpoint of a cardiovascular event compared to 488 (8%) of perindopril-receiving patients, for a 20% relative risk reduction (p=0.0003). This result was not influenced by presence of other comorbidities (eg, diabetes, hypertension) or concomitant beta-blocker, calcium channel blocker, or lipid-lowering therapies. Withdrawal from the study (postrandomization) due to adverse reactions was similar between treatment groups. The number needed to treat analysis suggests that treatment of 50 patients over a 4-year period will prevent one major cardiovascular event.

Acute Coronary Syndromes: In the treatment of unstable angina/non-ST-segment elevation MI, ACE inhibitors are recommended when hypertension persists despite treatment with nitroglycerin and a beta-blocker in patients with LV systolic dysfunction or CHF and in ischemic patients with diabetes (Class I). ACE inhibitors are also recommended for all post-ACS individuals (Class IIa). According to 2004 ACC/AHA STEMI guidelines, an ACE inhibitor should be administered orally within the first 24 hours of STEMI to patients with anterior infarction, pulmonary congestion, or LVEF <0.4, in the absence of hypotension or known contraindications to this class of medicines. In the emergency management of complicated STEMI, a short-acting ACEI (eg, captopril 1-6.25 mg) may be added once the patient's systolic blood pressure is >100 mm Hg and not <30 mm Hg below baseline. The VALIANT trial evaluated the effects of valsartan (target dose: 160 mg twice daily), captopril (target dose: 50 mg twice daily), and the combination (target doses: valsartan 80 mg twice daily and captopril 150 mg once daily) in a randomized, double-blind trial of patients with acute MI (0.5-10 days post-MI) complicated by left ventricular systolic dysfunction, heart failure, or both. Enrollment in the study numbered 14,703 patients and followed for a median of 24.7 months. There was no difference in the primary endpoint (all cause mortality) among the three groups. There was no difference in incidence of CV death, recurrent MI, or hospitalization for heart failure either. Hypotension and renal dysfunction occurred significantly more often in the valsartan group than with captopril alone. Cough, rash, and taste disturbances occurred more often in the captopril group. The authors (Pfeffer MA, 2003) concluded that valsartan is as effective as captopril in patients who are at high risk for cardiovascular events after MI. Combining valsartan with captopril increased the rate of adverse events without improving survival.

Potential Adverse Events: ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. In those patients experiencing cough on an ACE inhibitor, the ACE inhibitor may be discontinued and, if necessary, ARB therapy instituted. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Drug Interactions: Concomitant indomethacin therapy may blunt the reduction in sitting and 24-hour ambulatory diastolic blood pressure. Use of NSAIDs should be avoided or limited, with monitoring of blood pressure control in this setting. In patients with heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Anesthesia and Critical Care Concerns/Other ConsiderationsAging patients with a decrease in glomerular filtration (also creatinine clearance), severe congestive heart failure, and renal failure may experience an exaggerated response with administration of ACE inhibitors. Diabetic proteinuria is reduced and insulin sensitivity is enhanced. In general, the side effect profile is favorable in elderly and causes little or no CNS confusion.

ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. In this situation, they decrease hospitalizations for, and retard progression to, congestive heart failure. ACE inhibitors are also indicated in patients postmyocardial infarction in whom left ventricular ejection fraction is <40%. When used in patients with heart failure, the target dose or maximum tolerated dose, should be achieved, if possible. Lower daily doses of ACE inhibitors have not demonstrated the same cardioprotective effects. ACE inhibitors have renal protective effects in patients with proteinuria and possibly cardioprotective effects in high-risk patients.

ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. In those patients experiencing cough on an ACE inhibitor, the ACE inhibitor may be discontinued and, if necessary, angiotensin-receptor blocker therapy instituted. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Index TermsBenazepril Hydrochloride

Bendamustine-Rituximab

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pharmacologic CategoryChemotherapy Regimen, Lymphoma, non-Hodgkin's

Regimen UseLymphoma, non-Hodgkin's (Mantle cell or low-grade NHL)

Index TermsRituximab-Bendamustine

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Pretreatment:

Rituximab: I.V.: 375 mg/m^2 1 week before the start of cycle 1

[total dose/pretreatment = 375 mg/m^2]

Cycles:

Rituximab: I.V.: 375 mg/m^2 day 1

[total dose/cycle = 375 mg/m^2]

Bendamustine: I.V.: 90 mg/m^2 days 2 and 3

[total dose/cycle = 180 mg/m^2]

Repeat cycle every 4 weeks for up to 4 cycles

Post-Treatment:

Rituximab: I.V.: 375 mg/m^2 4 weeks after the last cycle

[total dose/post-treatment = 375 mg/m^2]

Variation 2:

Pretreatment:

Rituximab: I.V.: 375 mg/m^2 1 week before the start of cycle 1

[total dose/pretreatment = 375 mg/m^2]

Cycles:

Rituximab: I.V.: 375 mg/m^2 day 1

[total dose/cycle = 375 mg/m^2]

Bendamustine: I.V.: 90 mg/m^2 days 2 and 3

[total dose/cycle = 180 mg/m^2]

Repeat cycle every 4 weeks for 4-6 cycles

Post-Treatment:

Rituximab: I.V.: 375 mg/m^2 4 weeks after the last cycle

[total dose/post-treatment = 375 mg/m^2]

Bendamustine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Bendamustine may be confused with carmustine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ben da MUS teen)
U.S. Brand NamesTreanda®
Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent
Use: Labeled IndicationsTreatment of chronic lymphocytic leukemia (CLL); treatment of progressed indolent B-cell non-Hodgkin's lymphoma (NHL)
Use: Unlabeled/InvestigationalTreatment of mantle cell lymphoma; salvage therapy for relapsed multiple myeloma
Dosing: Adults

CLL: I.V.: 100 mg/m^2 on days 1 and 2 of a 28-day treatment cycle (for up to 6 cycles)

NHL: I.V.: 120 mg/m^2 on days 1 and 2 of a 21-day treatment cycle for up to 8 cycles

Mantle cell lymphoma (unlabeled use): I.V.: 90 mg/m^2 days 2 and 3 of a 28-day treatment cycle for up to 4 cycles (Rummel, 2005)

Multiple myeloma (unlabeled use): I.V.: 90-100 mg/m^2 on days 1 and 2 of a 28-day treatment cycle for at least 2 cycles (Knop, 2005)

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal Impairment
Mild-to-moderate renal impairment: Use with caution.

Cl_{cr} <40 mL/minute: Use is not recommended.

Dosing: Hepatic Impairment

Mild hepatic impairment: Use with caution.

Moderate hepatic impairment (AST or ALT 2.5-10 times ULN and total bilirubin 1.5-3 times ULN): Use is not recommended.

Severe hepatic impairment (total bilirubin >3 times ULN): Use is not recommended.

Dosing: Adjustment for Toxicity
Treatment delay:

Hematologic toxicity ≥grade 4: Delay treatment until resolves (ANC ≥1000/mm^3, platelets ≥75,000/mm^3)

Nonhematologic toxicity ≥grade 2 (clinically significant): Delay treatment until resolves to ≤grade 1

Dose modification CLL:

Hematologic toxicity ≥grade 3: Reduce dose to 50 mg/m^2 on days 1 and 2 of each treatment cycle. For recurrent hematologic toxicity (≥grade 3), further reduce dose to 25 mg/m^2 on days 1 and 2 of the treatment cycle. May cautiously re-escalate dose in subsequent cycles.

Nonhematologic toxicity ≥grade 3 (clinically significant): Reduce dose to 50 mg/m^2 on days 1 and 2 of the treatment cycle with discretion. May cautiously re-escalate dose in subsequent cycles.

Dose modification in NHL:

Hematologic toxicity grade 4: Reduce dose to 90 mg/m^2 on days 1 and 2 of each treatment cycle. For recurrent hematologic toxicity (grade 4), further reduce dose to 60 mg/m^2 on days 1 and 2 of each treatment cycle.

Nonhematologic toxicity ≥grade 3: Reduce dose to 90 mg/m^2 on days 1 and 2 of the treatment cycle with discretion. For recurrent toxicity ≥grade 3, further reduce dose to 60 mg/m^2 on days 1 and 2 of each treatment cycle.

Dosing: Combination Regimens

Lymphoma, non-Hodgkin's: Bendamustine-Rituximab

Lymphoma, non-Hodgkin's: (Mantle Cell): Bendamustine-Rituximab

Calculations

- Body Surface Area: Adults
- Creatinine Clearance: Adults

Administration: I.V.Infuse over 30 minutes for the treatment of CLL and over 60 minutes for NHL. Prophylactic treatment with allopurinol may be needed in patients at risk for tumor lysis syndrome. Consider premedication with antihistamines, antipyretics, and/or corticosteroids for patients with a previous grade 1 or 2 infusion reaction to bendamustine.

Administration: I.V. DetailpH: 2.5-3.5

Dietary ConsiderationsPatients should maintain adequate hydration.

StoragePrior to reconstitution, store intact vials at 25°C (77°F); excursions permitted up to 30°C (86°F). Protect from light. The solution in the vial (reconstituted with SWFI) is stable for 30 minutes (transfer to 500 mL infusion bag within that 30 minutes). The solution diluted in 500 mL for infusion is stable for 24 hours refrigerated or 3 hours at room temperature and room light. Infusion must be completed within these time frames.

ReconstitutionUse appropriate precautions for handling and disposal. Reconstitute 100 mg vial with 20 mL of sterile water for injection to a concentration of 5 mg/mL; powder usually dissolves within 5 minutes. Prior to administration, dilute appropriate dose in 500 mL NS (or $D_{2.5}{}^{1}/_{2}NS$) to a final concentration of 0.2-0.6 mg/mL; mix thoroughly.

CompatibilityStable in NS, $D_{2.5}{}^{1}/_{2}NS$

ContraindicationsHypersensitivity to bendamustine, mannitol, or any component of the formulation

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Myelosuppression (neutropenia, thrombocytopenia and anemia) is a common toxicity; may require therapy delay and/or dose reduction; monitor. Complications due to febrile neutropenia and severe thrombocytopenia have been reported. ANC should recover to ≥1000/mm^3 and platelets to ≥75,000/mm^3 prior to therapy/cycle initiation.

- Dermatologic toxicity: Rash, toxic skin reactions and bullous exanthema have been reported with monotherapy and in combination with other antineoplastics; may be progressive or worsen with continued treatment. Toxic epidermal necrolysis has been reported when used in combination with rituximab. Discontinue bendamustine treatment for severe or progressive skin reaction.

- Hypersensitivity/infusion reaction: Infusion reactions, which may include chills, fever, pruritus, and rash, are common. Rarely, anaphylactic and anaphylactoid reactions have occurred, particularly with the second or subsequent cycle(s). In general, patients who experienced grade 3 or 4 allergic reactions were not rechallenged in CLL clinical trials. Consider premedication with antihistamines, antipyretics and/or corticosteroids for patients with a history of grade 1 or 2 infusion reaction. Discontinue for severe allergic reaction; consider discontinuation with grade 3 or 4 infusion reaction.

- Infection: Infections, including pneumonia and sepsis have been reported with use; may require hospitalization; septic shock and fatalities have occurred. Patients with myelosuppression are more susceptible to infection; monitor closely.

- Malignancy: Malignancies (including myelodysplastic syndrome, myeloproliferative disorders, acute myeloid leukemia and bronchial cancer) have been reported in patients who have received bendamustine.

- Tumor lysis syndrome: Tumor lysis syndrome may occur as a consequence of leukemia treatment, including treatment with bendamustine, usually occurring in the first treatment cycle. May lead to life threatening acute renal failure; adequate hydration and prophylactic allopurinol should be instituted prior to treatment in high risk patients; monitor closely.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with mild hepatic impairment. Use is not recommended in patients with moderate (AST or ALT 2.5-10 times ULN and total bilirubin 1.5-3 times ULN) or severe (total bilirubin >3 times ULN) hepatic impairment.

- Renal impairment: Use with caution in patients with mild-to-moderate renal impairment. Use is not recommended in patient with Cl_{cr} <40 mL/minute.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenic and nonteratogenic events were observed in animal studies following intraperitoneal dosing. There are no adequate and well-controlled studies in pregnant women. May cause fetal harm if administered during pregnancy. Effective contraception is recommended during and for 3 months after treatment for women and men of reproductive potential.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

>10%:

Cardiovascular: Peripheral edema (≤13%)

Central nervous system: Fatigue (9% to 57%), fever (24% to 34%), headache (≤21%), chills (6% to 14%), dizziness (≤14%), insomnia (≤13%)

Dermatologic: Rash (8% to 16%; grades 3/4: ≤3%)

Endocrine & metabolic: Dehydration (≤14%)

Gastrointestinal: Nausea (20% to 75%), vomiting (16% to 40%), diarrhea (9% to 37%), constipation (≤29%), anorexia (≤23%), weight loss (7% to 18%), stomatitis (≤15%), abdominal pain (5% to 13%), appetite loss (≤13%), dyspepsia (≤11%)

Hematologic: Myelosuppression (nadir: in week 3), lymphopenia (68% to 99%; grades 3/4: 47% to 94%), leukopenia (61% to 94%; grades 3/4: 28% to 56%), anemia (88% to 89%; grades 3/4: 11% to 13%), thrombocytopenia (77% to 86%; grades 3/4: 11% to 25%), neutropenia (75% to 86%; grades 3/4: 43% to 60%)

Hepatic: Bilirubin increased (≤34%; grades 3/4: 3%)

Neuromuscular & skeletal: Back pain (≤14%), weakness (8% to 11%)

Respiratory: Cough (4% to 22%), dyspnea (≤16%)

1% to 10%:

Cardiovascular: Tachycardia (≤7%), hypotension (≤6%), chest pain (≤6%), hypertension aggravated (≤3%)

Central nervous system: Anxiety (≤8%), depression (≤6%), pain (≤6%)

Dermatologic: Pruritus (5% to 6%), dry skin (≤5%)

Endocrine & metabolic: Hypokalemia (≤9%), hyperuricemia (≤7%; grades 3/4: 2%), hyperglycemia (grades 3/4: ≤3%), hypocalcemia (grades 3/4: ≤2%), hyponatremia (grades 3/4: ≤2%)

Gastrointestinal: Gastroesophageal reflux disease (≤10%), xerostomia (9%), taste alteration (≤7%), oral candidiasis (≤6%), abdominal distention (≤5%)

Genitourinary: Urinary tract infection (≤10%)

Hematologic: Febrile neutropenia (3% to 6%)

Hepatic: ALT increased (grades 3/4: ≤3%), AST increased (grades 3/4: ≤1%)

Local: Infusion site pain (≤6%), catheter site pain (≤5%)

Neuromuscular & skeletal: Arthralgia (≤6%), bone pain (≤5%), limb pain (≤5%)

Renal: Creatinine increased (grades 3/4: ≤2%)

Respiratory: Upper respiratory infection (10%), sinusitis (≤9%), pharnygolaryngeal pain (≤8%), pneumonia (≤8%), nasopharyngitis (6% to 7%), wheezing (≤5%), nasal congestion (≤5%)

Miscellaneous: Herpes infection (3% to 10%), infection (≤6%; grades 3/4: 2%), hypersensitivity (≤5%; grades 3/4: 1%), diaphoresis (≤5%), night sweats (≤5%)

<1%, postmarketing, and/or case reports: Acute renal failure, alopecia, anaphylaxis, bullous exanthema, cardiac failure, dermatitis, erythema, hemolysis, infusion reaction, injection/infusion site reaction (irritation, pruritus, swelling), malaise, mucosal inflammation, myelodysplastic syndrome, pulmonary fibrosis, sepsis, septic shock, skin necrosis, somnolence, toxic epidermal necrolysis, toxic skin reactions, tumor lysis syndrome

Oncology: Emetic PotentialLow (10% to 30%)

Metabolism/Transport Effects**Substrate** of CYP1A2; P-glycoprotein (ABCB1); BCRP (ABCG2)

Drug Interactions

CYP1A2 Inducers (Strong): May decrease the serum concentration of Bendamustine. Concentrations of active metabolites may be increased. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May increase the serum concentration of Bendamustine. Concentrations of the active metabolites of bendamustine may be decreased. *Risk C: Monitor therapy*

Monitoring ParametersCBC with differential (in clinical trials, WBC with differential and hemoglobin were monitored weekly; platelets were monitored with each cycle); serum creatinine (pretreatment); ALT, AST, and total bilirubin (pretreatment); monitor potassium and uric acid levels in patients at risk for tumor lysis syndrome

Nursing: Physical Assessment/MonitoringUse with caution in presence of hepatic or renal impairment. Assess all other pharmacological or herbal products patient may be taking for potential interactions or toxicity. See specific instructions for reconstitution and administration. Assess results of laboratory tests at baseline and periodically during therapy (myelosuppression may require therapy delay or dose reduction). Monitor therapeutic response and adverse effects regularly during therapy (infusion reactions, including toxic skin reactions, can occur with first or subsequent cycles and may require premedication or discontinuation). Teach patient or caregiver possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential (in clinical trials, WBC with differential and hemoglobin were monitored weekly; platelets were monitored with each cycle); serum creatinine (pretreatment); ALT, AST, and total bilirubin (pretreatment); monitor potassium and uric acid levels in patients at risk for tumor lysis syndrome

Patient EducationDo not take any new prescription or over-the-counter medications, or herbal products during therapy without consulting prescriber. This medication can only be administered by I.V. Report immediately any pain, burning, swelling at infusion site; sudden onset chest pain, respiratory difficulty, difficulty swallowing. It is important that you maintain adequate nutrition between treatments (small, frequent meals may help) and adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will be susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea, vomiting, or weight loss (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea (boiled milk, buttermilk, or yogurt may help). Report immediately chills, fever, skin rash, persistent unusual fatigue; unusual bruising/bleeding; signs of infection, or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Treanda®: 100 mg [contains mannitol 170 mg]

Generic AvailableNo

ManufacturerCephalon, Inc

Mechanism of ActionBendamustine is an alkylating agent (nitrogen mustard derivative) with a benzimidazole ring (purine analog) which demonstrates only partial cross-resistance (in vitro) with other alkylating agents. It leads to cell death via single and double strand DNA cross-linking. Bendamustine is active against quiescent and dividing cells. The primary cytotoxic activity is due to bendamustine (as compared to metabolites).

Pharmacodynamics/Kinetics

Distribution: V_{ss}: ~25 L

Protein binding: 94% to 96%

Metabolism: Hepatic, via CYP1A2 to active (minor) metabolites gamma-hydroxy bendamustine (M3) and N-desmethyl-bendamustine (M4)

Half-life elimination: Bendamustine: ~40 minutes; M3: ~3 hours; M4: ~30 minutes

Time to peak, serum: At end of infusion

Excretion: Feces (~90%); urine (1% to 10%)

Related Information

- Common Toxicity Criteria
- Management of Nausea and Vomiting
- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis, xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue

Mental Health: Effects on Psychiatric TreatmentBone marrow suppression is common; use caution with clozapine, carbamazepine, and valproic acid. GI side effects are common; concomitant use with lithium, valproic acid, carbamazepine, and SSRIs may produce additive effects. Carbamazepine and phenobarbital may decease the levels/effects of bendamustine. Fluvoxamine may increase the levels/effects of bendamustine.

Index TermsBendamustine Hydrochloride; Cytostasan; SDX-105

Benserazide and Levodopa

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ben SER a zide & lee voe DOE pa)

Canadian Brand NamesProlopa®

Pharmacologic CategoryAnti-Parkinson's Agent, Dopamine Agonist

Use: Labeled IndicationsTreatment of Parkinson's disease (except drug-induced Parkinsonism)

Dosing: Adults

Parkinson's disease: Oral: **Note:** Dosage expressed as levodopa/benserazide:

Initial: 100/25 mg 1-2 times/day, increase every 3-4 days until therapeutic effect; optimal dosage: 400/100 mg to 800/200 mg/day divided into 4-6 doses

Note: 200/50 mg used only when maintenance therapy is reached and not to exceed levodopa 1000-1200 mg/benserazide 250-300 mg per day

Patients previously on levodopa: Allow 12 hours or more to lapse between last dose of levodopa; start at 15% of previous levodopa dosage

Note: Dosages should be introduced gradually, individualized, and continued for 3-6 weeks before assessing benefit. Decrease dosage in patients with dystonia.

Dosing: ElderlyRefer to adult dosing.

Administration: OralCapsules should be swallowed whole; do not crush, chew, open, or dissolve in liquid.

Dietary ConsiderationsHigh-protein diets may decrease effect of levodopa. Food impairs or reduces the rate and extent of levodopa absorption (15% to 30%). Pyridoxine may inhibit levodopa's antiparkinsonian effects (monitor for reduced effect).

StorageStore at 15°C to 30°C (59°F to 86°F) in tightly closed, light-resistant container.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to benserazide, levodopa, sympathomimetics, or any component of the formulation; use of MAO inhibitors within prior 14 days; patients with clinical laboratory evidence of uncompensated cardiovascular, endocrine, renal, hepatic, hematologic, or pulmonary disease; patients with decompensated endocrine, renal, hepatic, cardiac disorders, psychiatric disorders, narrow-angle glaucoma, or closed-angle glaucoma; patients <25 years of age (due to possibility of skeletal abnormalities from benserazide); pregnancy or use in women of childbearing potential without adequate contraception

Warnings/Precautions

Concerns related to adverse effects:

- Increased growth hormone levels: May increase human growth hormone levels.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (MI, atrial, nodal, or ventricular arrhythmias); initiate in a monitored setting.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Glaucoma: Use with caution in patients with glaucoma; monitor IOP carefully in patients with wide-angle glaucoma.
- Melanoma: Use with caution in patients with melanoma or suspicious undiagnosed skin lesions.
- Peptic ulcer disease: Use with caution in patients with peptic ulcer disease.
- Psychotic disorders: Use with extreme caution in patients with psychotic disorders; observe patients closely for development of depression with concomitant suicidal tendencies.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Concurrent drug therapy issues:

- Current levodopa therapy: If patient is already receiving levodopa, discontinue levodopa at least 12 hours before starting benserazide/levodopa and begin at 15% of previous amount of levodopa.
- Phenothiazines: Use with caution in patients receiving phenothiazines.
- Reserpine: Use with caution in patients receiving reserpine.
- Tricyclic antidepressants (TCAs): Use with caution in patients receiving TCAs.

Other warnings/precautions:

- Abrupt withdrawal: Do not withdraw abruptly (may cause neuroleptic malignant syndrome).

- Appropriate use: Not indicated in management of intention tremor, Huntington's chorea, or drug-induced extrapyramidal symptoms. Administer in careful increments and observe closely for development of abnormal involuntary movements.

- Patient information: Patient must be instructed to resume normal activities gradually (rapid mobilization may increase risk of injury).

Pregnancy Risk FactorX (based on similar agents)

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Levodopa has caused visceral and skeletal malformations in animals and is therefore contraindicated in pregnant women and women of childbearing age without proper contraception.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsIt is not known if benserazide passes into breast milk, but breast-feeding is not recommended since occurrence of skeletal malformations in infants cannot be excluded.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, chest pain, edema, ECG changes (nonspecific), flushing, hypertension, orthostatic hypotension, phlebitis

Central nervous system: Agitation, ataxia, bruxism, confusion, convulsions, delusions, dementia, depression, euphoria, faintness, fatigue, fever, gait abnormalities, hallucinations, headache, insomnia, lethargy, malaise, nightmares, oculogyric crisis, paranoid ideation, psychotic episodes, sedation, suicidal tendencies/behavior, temporal disorientation, anxiety, trismus

Dermatological: Alopecia, pruritus, rash

Endocrine & metabolic: Libido increased, protein-bound iodine increased, uric acid increased, weight gain/loss

Gastrointestinal: Abdominal distress or pain, anorexia, constipation, diarrhea, duodenal ulcer, dyspepsia, epigastric pain, eructation, flatulence, GI bleeding, nausea, sialorrhea, taste alterations, vomiting

Genitourinary: Discoloration of urine, hematuria, nocturia, urinary frequency, urinary retention or incontinence

Hematologic: Positive Coombs' test

Hepatic: Alkaline phosphatase increased, bilirubin increased, LDH increased, transaminases increased

Neuromuscular & skeletal: Akinesia paradoxica, choreiform and involuntary movements, dystonia, end-of-dose akinesia, hand tremor, low back pain, muscle spasm and twitching, musculoskeletal pain, numbness, torticollis, weakness

Ocular: Activation of latent Horner's syndrome, blepharospasm, blurred vision, diplopia, diluted pupils

Renal: BUN increased

Respiratory: Bizarre breathing pattern, cough, hoarseness, postnasal drip

Miscellaneous: Discoloration of sweat; hiccups; lip, mouth, tongue tightness

Drug Interactions

Antipsychotics (Atypical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Antipsychotics (Typical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Iron Salts: May decrease the absorption of Levodopa. Only applies to oral iron preparations. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

MAO Inhibitors: Levodopa may enhance the adverse/toxic effect of MAO Inhibitors. Of particular concern is the development of hypertensive reactions when levodopa is used with nonselective MAOI. *Risk D: Consider therapy modification*

Methionine: May diminish the therapeutic effect of Levodopa. Probably only with large doses of methionine. Data was generated using 4.5gm daily. *Risk D: Consider therapy modification*

Metoclopramide: May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk C: Monitor therapy*

Phenytoin: May diminish the therapeutic effect of Levodopa. *Risk C: Monitor therapy*

Pyridoxine: May diminish the therapeutic effect of Levodopa. *Risk D: Consider therapy modification*

Sapropterin: May enhance the adverse/toxic effect of Levodopa. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: High-protein diets may decrease effect of levodopa; food impairs or reduces the rate and extent of levodopa absorption (15% to 30%). Iron salts (ferrous sulfate) may decrease the absorption of levodopa.

Test InteractionsCatecholamines, creatinine, uric acid, and glucose

Monitoring ParametersRegular assessment of cardiovascular, hepatic, hematopoietic, and renal function. If you have diabetes, monitor blood glucose.

Monitoring: Lab TestsRegular assessment of cardiovascular, hepatic, hematopoietic, and renal function. If you have diabetes, monitor blood glucose.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Capsule:

Prolopa® [CAN]:

50-12.5: Levodopa 50 mg and benserazide 12.5 mg [not available in the U.S.]

100-25: Levodopa 100 mg and benserazide 25 mg [not available in the U.S.]

200-50: Levodopa 200 mg and benserazide 50 mg [not available in the U.S.]

Generic AvailableNo

Mechanism of ActionLevodopa appears to correct the akinesia of Parkinson's disease by formation of dopamine at nigrostriatal dopaminergic sites that remain functional. Benserazide inhibits peripheral decarboxylation of levodopa without significantly affecting its metabolism in brain.

Pharmacodynamics/Kinetics

Absorption: 66% to 74% from GI tract

Distribution: 57 L

Half-life elimination: 1.5 hours

Time to peak serum concentration: 1.5 hours

Excretion: 53% to 64% in urine

Pharmacotherapy PearlsNot available in U.S.
“On-off” (a clinical syndrome characterized by sudden periods of drug activity/inactivity) can be managed by giving smaller, more frequent doses or adding a dopamine agonist or selegiline. Protein in the diet should be distributed throughout the day to avoid fluctuations in levodopa absorption.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSevere psychiatric adverse effects (including depression, suicidal ideation, and suicide attempt) may occur. May also cause agitation, ataxia, confusion, convulsions, delusions, dementia, euphoria, fatigue, hallucinations, insomnia, nightmares, paranoid ideation, psychotic episodes, or sedation.

Mental Health: Effects on Psychiatric TreatmentContraindicated in patients with a psychiatric disorder as well as with or within 14 days of MAO inhibitor therapy. Benserazide and levodopa is not approved for tremor, Huntington's chorea, or drug-induced extrapyramidal symptoms. Use with caution in patients receiving a phenothiazine or a TCA. Do not stop abruptly; may lead to neuroleptic malignant syndrome.

Index TermsLevodopa and Benserazide

International Brand NamesLevazide (ID); Levopar (DE, ID); Levopar Plus (IL); Madopar (AR, AU, CH, CL, CO, CZ, DE, DK, EE, ES, FI, GB, GR, HK, HN, ID, IE, IN, KP, MX, NL, NO, PE, PH, PK, PT, TH, TW, VE); Madopark (SE); Modopar (FR); Prolopa (BE, BR, CN, PY, UY); Seler (PY); Tonotil (UY); Vopar (TH)

Pronunciation(BEN toe kwa tam)
U.S. Brand NamesIvyBlock® [OTC]
Pharmacologic CategoryTopical Skin Product
Use: Labeled IndicationsSkin protectant for the prevention of allergic contact dermatitis to poison oak, ivy, and sumac
Dosing: AdultsPrevention of contact dermatitis: Topical: Apply to skin 15 minutes prior to potential exposure to poison ivy, poison oak, or poison sumac, and reapply every 4 hours
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren >6 years: Refer to adult dosing.
ContraindicationsHypersensitivity to bentoquatam or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Allergic-type responses: Use with caution in patients with history of allergic-type responses to medications (especially topical formulations).

Disease-related concerns:

- Cutaneous conditions: Use with caution in patients with open wounds, psoriatic lesions, or other cutaneous conditions.
- Poison oak/ivy/sumac: Use with caution in patients who are postexposure to poison oak, ivy, or sumac (lack of efficacy).

Adverse Reactions<1%: Erythema
Drug InteractionsThere are no known significant interactions.
Monitoring ParametersSigns and symptoms of exposure to poison oak, ivy, or sumac (rash, swelling, blisters)
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Lotion:

IvyBlock®: 5% (120 mL) [contains alcohol 25% and benzyl alcohol]

Generic AvailableNo
Mechanism of ActionAn organoclay substance which is capable of absorbing or binding to urushiol, the active principle in poison oak, ivy, and sumac. Bentoquatam serves as a barrier, blocking urushiol skin contact/absorption.
Pharmacodynamics/KineticsAbsorption: Has not been studied
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsQuaternium-18 Bentonite

Benzalkonium Chloride and Isopropyl Alcohol

Jump To Field (Select Field Name)

Pronunciation(benz al KOE nee um KLOR ide & eye so PRO pil AL koe hol)
U.S. Brand NamesViroxyn® [OTC]
Pharmacologic CategoryAntiseptic, Topical
Use: DentalTopical: Germicidal for the treatment of cold sores/fever blisters
Dosing: AdultsTopical: One single application treatment to affected area. Secondary events (new viral load in the initial lesion, which may occur 12-72 hours after initial symptoms) or additional sore presentations will require additional treatment with a new vial. See Administration information for application instructions.

Manufacturer states medication should not be used >3 times/day; however, instructions indicate that a single application is generally effective if instructions are followed.

Dosing: ElderlyRefer to adult dosing.
Administration: OtherUse this product according to the following directions from the manufacturer:

1) Prior to treatment, clean area to be treated of all other preparations (ointments, treatments, lipstick). Do not use soap or other cleansers. A dry wipe may be sufficient, or you may use water or alcohol if necessary.

2) Remove cap from vial and replace on the other end over the clear plastic tube. Hold vial between thumb and index finger, applicator end up. Pinch vial in the center at top of cap until the inner ampul of medication breaks.

3) Hold white applicator down and allow medication to saturate the swab. If necessary, pinch vial gently until a drop of medication just appears.

4) Place the applicator against the area of skin to be treated so that the tip of the applicator is held flat against the skin. The key is to massage medication into the sore and the surrounding area by rubbing. Do not rub so hard that you cause damage to the skin. For best results, the patient should massage drug into the sore by rubbing. The rubbing should proceed for about 10 minutes or until all the drug has been massaged into the sore. The application may sting. This is normal and should subside quickly. For best results, medication must penetrate the subepidermal layers of the skin to site of infection. The ingredients facilitate penetration, but mechanical action is critical. Simply dabbing the drug onto the sore is not likely to give best results.

5) If treating at prodrome (tingling sensation before lesion erupts), a more vigorous rubbing is easily tolerated and gives best results. If the lesion has progressed to vesicle or ulcerated lesion, the patient may prefer to rub less vigorously but for a longer time period.

6) Keep applicator saturated at all times. If necessary, pause and hold vial so as to allow medication to flow into applicator. When finished recap vial. Dispose of immediately. Do not disassemble. Store at room temperature. Flammable; do not expose to high heat or flame. Keep out of reach of children.

Dietary ConsiderationsAvoid citric acid-containing beverages (eg, lemonade or orange juice) for at least 1 hour following application.
StorageStore at room temperature. Flammable; do not expose to high heat or flame.
ContraindicationsHypersensitivity to benzalkonium chloride, isopropyl alcohol, or any component of the formulation
Warnings/Precautions

Special populations:

- Pediatrics: Avoid use in children <2 years of age.

- Pregnancy: Avoid use in pregnant or lactating women.

Other warnings/precautions:

- Appropriate use: For topical use only; ingestion may lead to gastric irritation or distress. Avoid contact with eyes; flush with eye bath if inadvertent contact occurs. Avoid use of anionic cleansers or acidic products for at least 1 hour following application (active ingredient will be neutralized). Avoid the use of soap, toothpaste, cleansers, or drinks containing citric acid (including lemonade and orange juice). Should not be used >3 times/day.

- Flammable: Formulation in isopropyl alcohol is flammable; avoid use near sparks, flames, or high temperatures.

Adverse ReactionsFrequency not defined

Ocular: Irritation (following inadvertent contact)

Respiratory: Vapors may cause cough, dyspnea

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, topical: Benzalkonium 0.13% in isopropyl alcohol [kit includes 3 single-dose applicators]

Generic AvailableNo

Mechanism of ActionGermicidal due to disruption of the viral capsid coat by the quaternary ammonium benzalkonium chloride ingredient.

Dental Health Professional ConsiderationsUse this product according to the following directions from the manufacturer. 1) Prior to treatment, clean area to be treated of all other preparations (ointments, treatments, lipstick). Do not use soap or other cleansers. A dry wipe may be sufficient, or you may use water or alcohol if necessary. 2) Remove cap from vial and replace on the other end over the clear plastic tube. Hold vial between thumb and index finger, applicator end up. Pinch vial in the center at top of cap until the inner ampul of medication breaks. 3) Hold white applicator down and allow medication to saturate the swab. If necessary, pinch vial gently until a drop of medication just appears. 4) Place the applicator against the area of skin to be treated so that the tip of the applicator is held flat against the skin. The key is to massage medication into the sore and the surrounding area by rubbing. Do not rub so hard that you cause damage to the skin. For best results, the patient should massage drug into the sore by rubbing. The rubbing should proceed for about 10 minutes or until all the drug has been massaged into the sore. The application may sting. This is normal and should subside quickly. For best results, medication must penetrate the subepidermal layers of the skin to site of infection. The ingredients facilitate penetration, but mechanical action is critical. Simply dabbing the drug onto the sore is not likely to give best results. 5) If treating at prodrome (tingling sensation before lesion erupts), a more vigorous rubbing is easily tolerated and gives best results. If the lesion has progressed to vesicle or ulcerated lesion, the patient may prefer to rub less vigorously but for a longer time period. 6) Keep applicator saturated at all times. If necessary, pause and hold vial so as to allow medication to flow into applicator. When finished recap vial. Dispose of immediately. Do not disassemble. Store at room temperature. Flammable; do not expose to high heat or flame. Keep out of reach of children.

Pronunciation(benz al KOE nee um KLOR ide)

U.S. Brand Names3M™ Cavilon™ Skin Cleanser [OTC] [DSC]; HandClens® [OTC]; Pedi-Pro®; Pronto® Plus Lice Egg Remover Kit [OTC]; Zephiran® [OTC]

Pharmacologic CategoryAntibiotic, Topical

Use: Labeled IndicationsSurface antiseptic and germicidal preservative

Use: DentalSurface antiseptic and germicidal preservative

Dosing: AdultsAntiseptic: Topical: Thoroughly rinse anionic detergents and soaps from the skin or other areas prior to use of solutions because they reduce the antibacterial activity of BAC. To protect metal instruments stored in BAC solution, add crushed Anti-Rust Tablets, 4 tablets/quart, to antiseptic solution, change solution at least once weekly. Not to be used for storage of aluminum or zinc instruments, instruments with lenses fastened by cement, lacquered catheters, or some synthetic rubber goods.

Dosing: ElderlyRefer to adult dosing.

Compatibility**Incompatible** with BAC solutions: Iodine, silver nitrate, fluorescein, nitrates, peroxide, lanolin, potassium permanganate, aluminum, caramel, kaolin, pine oil, zinc sulfate, zinc oxide, and yellow mercuric oxide.

ContraindicationsHypersensitivity to benzalkonium or any component of the formulation

Pregnancy Risk FactorC

Adverse Reactions1% to 10%: Hypersensitivity

Drug InteractionsThere are no known significant interactions.

Benzocaine, Butamben, and Tetracaine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(BEN zoe kane, byoo TAM ben, & TET ra kane)
U.S. Brand NamesCetacaine®; Exactacain™
Pharmacologic CategoryLocal Anesthetic
Use: Labeled IndicationsTopical anesthetic to control pain in surgical or endoscopic procedures; anesthetic for accessible mucous membranes except for the eyes
Use: DentalTopical anesthetic for accessible mucous membranes
Dosing: AdultsAnesthesia: Topical:

Cetacaine®:

Aerosol: Apply for ≤1 second; use of sprays >2 seconds is contraindicated

Gel: Apply ~1/2 inch (13 mm) x 3/16 inch (5 mm); application of >1 inch (26 cm) x 3/16 inch (5 mm) is contraindicated

Liquid: Apply 6-7 drops (0.2 mL); application of >12-14 drops (0.4 mL) is contraindicated

Exactacain™: 3 metered sprays (use of >6 metered sprays is contraindicated)

Dosing: ElderlyDose reduction is suggested; refer to adult dosing.
Dosing: PediatricDose has not been established; dose reduction is suggested
Administration: TopicalAvoid application to large areas of broken skin, especially in children. When possible, apply to clean, dry area, however, tissue need not be dried prior to application. When administering a spray formulation, the number of sprays administered and the length of each spray should be monitored and recorded.

Aerosol (Exactacain™): Insert disposable applicator into the spray nozzle on can. Apply directly to the site where pain or gag control is desired for procedure (ear, nose, mouth, pharynx, larynx, trachea, bronchi, esophagus, vagina, or rectum). Discard applicator after each use.

Gel (Cetacaine®): Spread thinly and evenly over application area.

Liquid (Cetacaine®): Apply with cotton applicator or directly onto tissue; do not hold applicator in position for prolonged periods of time.

StorageExactacain™: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Do not store near (or expose to) heat, open flame, or temperatures >120°F. Do not puncture container.
ContraindicationsHypersensitivity to benzocaine, butamben, tetracaine, or any component of the formulation; ophthalmic use; cholinesterase deficiencies; large areas of denuded or inflamed tissue; administration in excess of product labeling
Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Methemoglobinemia: Has been reported following topical benzocaine use (rare), particularly with higher concentration (14% to 20%) spray formulations applied to the mouth or mucous membranes. The classical clinical finding of methemoglobinemia is chocolate brown-colored arterial blood. However, suspected cases should be confirmed by co-oximetry, which yields a direct and accurate measure of methemoglobin levels. Standard pulse oximetry readings or arterial blood gas values are not reliable. Clinically-significant methemoglobinemia requires immediate treatment. Use caution with breathing problems (asthma, bronchitis, emphysema, in smokers), inflamed/damaged mucosa, heart disease, children <6 months of age, and hemoglobin or enzyme abnormalities (glucose-6-phosphate dehydrogenase deficiency, hemoglobin-M disease, NADH-methemoglobin reductase deficiency, pyruvate-kinase deficiency). Alternatives to benzocaine sprays, such as topical lidocaine preparations, should be considered for patients at higher risk of this reaction.

Special populations:

- Acutely ill patients: Use with caution in acutely ill patients; dose adjustment is suggested.

- Debilitated patients: Use with caution in debilitated patients; dose adjustment is suggested.

- Elderly: Use with caution in the elderly; dose adjustment is suggested.

- Pediatrics: Use with caution in very young patients; dose adjustment is suggested.

Other warnings/precautions:

- Administration: For topical use only. Do not use under dentures or cotton rolls; retention of active ingredients may cause escharotic effect.

Pregnancy ConsiderationsSafety has not been established; use is not recommended during early pregnancy unless the potential benefits outweigh the risks.
Adverse ReactionsFrequency not defined. Also see individual monographs for Benzocaine and Tetracaine.

Dermatologic: Contact dermatitis (eg, erythema, pruritus, vesiculation, oozing); dehydration of the epithelium; escharotic effect

Miscellaneous: Hypersensitivity/anaphylaxis reaction (rare)

Drug InteractionsThere are no known significant interactions.
Monitoring Parameters

Monitor patients for signs and symptoms of methemoglobinemia such as pallor, cyanosis, nausea, muscle weakness, dizziness, confusion, agitation, dyspnea and tachycardia. The classical clinical finding of methemoglobinemia is chocolate brown-colored arterial blood. However, suspected cases should be confirmed by co-oximetry, which yields a direct and accurate measure of methemoglobin levels. Standard pulse oximetry readings or arterial blood gas values are not reliable. Clinically significant methemoglobinemia requires immediate treatment.

Nursing: Physical Assessment/MonitoringSee individual agents for Benzocaine and Tetracaine.
Monitoring: Lab TestsThe classical clinical finding of methemoglobinemia is chocolate brown-colored arterial blood. However, suspected cases should be confirmed by co-oximetry, which yields a direct and accurate measure of methemoglobin levels. Standard pulse oximetry readings or arterial blood gas values are not reliable. Clinically significant methemoglobinemia requires immediate treatment.
Patient EducationSee individual agents for Benzocaine and Tetracaine.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol, topical [spray]:

> Cetacaine®: Benzocaine 14%, butamben 2%, and tetracaine hydrochloride 2% (56 g) [delivers benzocaine 28 mg, butamben 4 mg, and tetracaine hydrochloride 4 mg per second; contains benzalkonium chloride and CFCs; packaged with cannula]
>
> Exactacain™: Benzocaine 14%, butamben 2%, and tetracaine hydrochloride 2% (60 g) [delivers benzocaine 9.3 mg, butamben 1.3 mg, and tetracaine 1.3 mg per metered spray; contains benzalkonium chloride; cherry flavor; packaged with 100 disposable applicators]

Gel, topical:

> Cetacaine®: Benzocaine 14%, butamben 2%, and tetracaine hydrochloride 2% (29 g) [provides benzocaine 28 mg, butamben 4 mg and tetracaine hydrochloride 4 mg per 0.5 inch (13 mm) x 3/16 inch (5 mm) application; contains benzalkonium chloride]

Liquid, topical:

> Cetacaine®: Benzocaine 14%, butamben 2%, and tetracaine hydrochloride 2% (56 g) [provides benzocaine 28 mg, butamben 4 mg, and tetracaine hydrochloride 4 mg per 6-7 drops (0.2 mL); contains benzalkonium chloride]

Generic AvailableNo
Mechanism of ActionReversible blockage of initiation and conduction of nerve impulses by deceasing the neuronal membrane's permeability to sodium ions
Pharmacodynamics/KineticsAlso see individual monographs for Benzocaine and Tetracaine.

Onset of action: ~30 seconds

Duration: 30-60 minutes

Metabolism: Plasma via hydrolysis by cholinesterase to inactive metabolites

Excretion: Urine (as inactive metabolites)

Related Information

- Benzocaine
- Tetracaine

Dental Health Professional ConsiderationsManufacturer indication for use is suppression of gag reflex for gastroenterological procedures.

Health Canada has issued a reminder to healthcare professionals that benzocaine sprays must be used judiciously to minimize the risk of methemoglobinemia. Almost all reported cases have been associated with higher concentration (14% to 20% benzocaine) spray products used in the mouth and on other mucous membranes. Alternatives to benzocaine sprays, such as topical lidocaine preparations, should be considered for patients at higher risk of this reaction.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: A patient history of allergy to ester-type local anesthetics contraindicates the use of this product (see Dental Comment).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Pharmacologic CategoryLocal Anesthetic

Use: Labeled IndicationsTemporary relief of pain associated with pruritic dermatosis, pruritus, minor burns, acute congestive, bee stings, and insect bites; mouth and gum irritations (toothache, minor sore throat pain, canker sores, dentures, orthodontia, teething, mucositis, stomatitis); sunburn; hemorrhoids; anesthetic lubricant for passage of catheters and endoscopic tubes

Use: DentalEster-type topical local anesthetic for temporary relief of pain associated with toothache, minor sore throat pain, and canker sore

Dosing: Adults**Note:** These are general dosing guidelines; Refer to specific product labeling for dosing instructions.

Bee stings, insect bites, minor burns, sunburn: Topical 5% to 20%: Apply to affected area 3-4 times a day as needed. In cases of bee stings, remove stinger before treatment.

Lubricant for passage of catheters and instruments: Topical 20%: Apply evenly to exterior of instrument prior to use.

Mouth and gum irritation: Topical (oral) 10% to 20%: Apply thin layer to affected area up to 4 times daily

Sore throat: Oral: Allow 1 lozenge (10-15 mg) to dissolve slowly in mouth; may repeat every 2 hours as needed

Hemorrhoids: Rectal 5% to 20%: Apply externally to affected area up to 6 times daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** These are general dosing guidelines; refer to specific product labeling for dosing instructions.

Teething pain: Children ≥4 months: Topical (oral): 7.5% to 10%: Apply to affected gum area up to 4 times daily

Bee stings, insect bites, minor burns, sunburn: Topical: Children ≥2 years: Refer to adult dosing.

Lubricant for passage of catheters and instruments: Topical: Children ≥2 years: Refer to adult dosing.

Mouth and gum irritation: Topical (oral) 10% to 20%: Children ≥2 years: Refer to adult dosing.

Sore throat: Oral: Children ≥5 years: Refer to adult dosing.

Hemorrhoids: Rectal 5% to 20%: Children ≥12 years: Refer to adult dosing.

Administration: TopicalAvoid application to large areas of broken skin, especially in children. When possible, apply to clean, dry area. When administering a spray formulation, the number of sprays administered and the length of each spray should be monitored and recorded.

ContraindicationsHypersensitivity to benzocaine, other ester-type local anesthetics, or any component of the formulation; secondary bacterial infection of area; ophthalmic use

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Methemoglobinemia: Has been reported following topical use (rare), particularly with higher concentration (14% to 20%) spray formulations applied to the mouth or mucous membranes. When applied as a spray to the mouth or throat, multiple sprays (or sprays of longer than indicated duration) are not recommended. Use caution with breathing problems (asthma, bronchitis, emphysema, in smokers), inflamed/damaged mucosa, heart disease, children <6 months of age, and hemoglobin or enzyme abnormalities (glucose-6-phosphate dehydrogenase deficiency, hemoglobin-M disease, NADH-methemoglobin reductase deficiency, pyruvate-kinase deficiency). Alternatives to benzocaine sprays, such as topical lidocaine preparations, should be considered for patients at higher risk of this reaction. The classical clinical finding of methemoglobinemia is chocolate brown-colored arterial blood. However, suspected cases should be confirmed by co-oximetry, which yields a direct and accurate measure of methemoglobin levels. Standard pulse oximetry readings or arterial blood gas values are not reliable. Clinically significant methemoglobinemia requires immediate treatment.

Other warnings/precautions:

- Self-medication (OTC use): When used for self-medication, notify healthcare provider if condition worsens or does not improve within 7 days, or if swelling, rash, or fever develops. Do not use on open wounds. Avoid contact with the eyes.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Hematologic: Methemoglobinemia

Local: Burning, contact dermatitis, edema, erythema, pruritus, rash, stinging, tenderness, urticaria

Miscellaneous: Hypersensitivity

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersMonitor patients for signs and symptoms of methemoglobinemia such as pallor, cyanosis, nausea, muscle weakness, dizziness, confusion, agitation, dyspnea and tachycardia. The classical clinical finding of methemoglobinemia is chocolate brown-colored arterial blood. However, suspected cases should be confirmed by co-oximetry, which yields a direct and accurate measure of methemoglobin levels. Standard pulse oximetry readings or arterial blood gas values are not reliable. Clinically significant methemoglobinemia requires immediate treatment.
Nursing: Physical Assessment/MonitoringMonitor for effectiveness of application and adverse reactions. Monitor for cyanosis, dyspnea, weakness, or tachycardia. This could indicate a life-threatening situation. **Oral:** Use caution to prevent gagging or choking and avoid food or drink for 1 hour. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.
Monitoring: Lab TestsThe classical clinical finding of methemoglobinemia is chocolate brown-colored arterial blood. However, suspected cases should be confirmed by co-oximetry, which yields a direct and accurate measure of methemoglobin levels. Standard pulse oximetry readings or arterial blood gas values are not reliable. Clinically significant methemoglobinemia requires immediate treatment.
Patient EducationUse as directed; do not overuse. Use least amount possible to obtain desired effect. Do not apply when infections are present and do not apply to large areas of broken skin. Do not eat or drink for 1 hour following oral application. Discontinue application and report if swelling of mouth, lips, tongue, or throat occurs; or if skin irritation occurs at application site. When using as a self-medication (OTC), notify prescriber if condition worsens or does not improve within 7 days or if swelling, rash, or fever develops. Report cyanosis (turning blue in color), weakness, problems breathing, or rapid heartbeat immediately. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Aerosol, oral spray:

Hurricaine®: 20% (60 mL) [dye free; cherry flavor]

Aerosol, topical spray:

Dermoplast® Antibacterial: 20% (83 mL) [contains aloe vera, benzethonium chloride, menthol]

Dermoplast® Pain Relieving: 20% (60 mL, 83 mL) [contains menthol]

Foille®: 5% (92 g) [contains chloroxylenol 0.63% and corn oil]

Ivy-Rid®: 2% (83 mL)

Lanacane® Maximum Strength: 20% (120 mL) [contains ethanol 36%]

Combination package (Orajel® Baby Daytime and Nighttime):

Gel, oral [Daytime Regular Formula]: 7.5% (5.3 g)

Gel, oral [Nighttime Formula]: 10% (5.3 g)

Cream, oral:

Benzodent®: 20% (7.5 g, 30 g)

Orajel PM® Maximum Strength: 20% (5.3 g, 7 g) [contains menthol]

Cream, topical:

Lanacane®: 6% (30 g, 60 g)

Lanacane® Maximum Strength: 20% (30 g)

Gel, oral:

Anbesol®: 10% (7.5 g) [contains benzyl alcohol; cool mint flavor]

Anbesol® Baby: 7.5% (7.5 g) [contains benzoic acid; grape flavor]

Anbesol® Jr.: 10% (7 g) [contains benzyl alcohol; bubble gum flavor]

Anbesol® Maximum Strength: 20% (7.5 g, 10 g) [contains benzyl alcohol]

Dentapaine: 20% (11 g) [contains clove oil]

HDA® Toothache: 6.5% (15 mL) [contains benzyl alcohol]

Hurricaine®: 20% (5 g) [dye free; wild cherry flavor]; (30 g) [dye free; mint, pina colada, watermelon, and wild cherry flavors]

Kank-A® Soft Brush™: 20% (2 mL) [packaged in applicator with brush tip]

Little Teethers®: 7.5% (9.4 g) [cherry flavor]

Orabase® with Benzocaine®: 20% (7 g) [contains ethanol 48%; mild mint flavor]

Orajel®: 10% (5.3 g, 7 g, 9.4 g)

Orajel® Baby Teething: 7.5% (9.4 g, 11.9 g) [cherry flavor]

Orajel® Baby Teething Nighttime: 10% (5.3 g)

Orajel® Denture Plus: 15% (9 g) [contains menthol 2%, ethanol 66.7%]

Orajel® Maximum Strength: 20% (5.3 g, 7 g, 9.4 g, 11.9 g)

Orajel® Mouth Sore: 20% (5.3 g, 9.4 g, 11.9 g) [contains allantoin, benzalkonium chloride 0.02%, zinc chloride 0.1%]

Orajel® Multi-Action Cold Sore: 20% (9.4 g) [contains allantoin 0.5%, camphor 3%, dimethicone 2%]

Orajel® Ultra Mouth Sore: 15% (9.4 g) [contains ethanol 66.7%, menthol 2%]

Zilactin®-B: 10% (7.5 g)

Gel, topical:

Detane®: 7.5% (15 g)

Liquid, oral:

Anbesol®: 10% (9 mL) [cool mint flavor; contains benzyl alcohol]

Anbesol® Maximum Strength: 20% (9 mL) [contains benzyl alcohol]

Hurricaine®: 20% (30 mL) [pina colada and wild cherry flavors; dye free]

Orajel® Baby Teething: 7.5% (13 mL) [very berry flavor]

Orajel® Maximum Strength: 20% (13 mL) [contains ethanol 44%, tartrazine]

Tanac®: 10% (13 mL) [contains benzalkonium chloride]

Liquid, oral [drops]:

Rid-A-Pain Dental: 6.3% (30 mL) [contains ethanol 70%]

Liquid, topical:

Chiggertox®: 2% (30 mL)

Outgro®: 20% (9 mL)

Skeeter Stik: 5% (14 mL) [contains menthol]

Lozenge: 6 mg (18s) [contains menthol]; 15 mg (10s)

Bi-Zets: 15 mg (10s)

Cepacol® Sore Throat: 15 mg (18s) [contains cetylpyridinium, menthol; cherry, citrus, and honey lemon flavors]

Cepacol® Sore Throat: 15 mg (16s) [sugar free; contains cetylpyridinium, menthol; cherry and menthol flavors]

Cylex®: 15 mg (12s) [sugar free; contains cetylpyridinium chloride 5 mg; cherry flavor]

Mycinettes®: 15 mg (12s) [sugar free; contains sodium 9 mg; cherry or regular flavor]

Sepasoothe®: 10 mg (6s, 24s, 100s, 250s, 500s) [sugar free; contains cetylpyridium 0.5 mg/lozenge; wild cherry flavor]

Thorets: 18 mg (300s) [sugar free]

Trocaine®: 10 mg (50s, 300s)

Ointment, oral:

Anbesol® Cold Sore Therapy: 20% (7.1 g) [contains benzyl alcohol, allantoin, aloe, camphor, menthol, vitamin E]

Red Cross™ Canker Sore: 20% (7.5 g) [contains coconut oil]

Ointment, rectal:

Americaine® Hemorrhoidal: 20% (30 g)

Ointment, topical:

Boil-Ease® Pain Relieving: 20% (30 g)

Chiggerex®: 2% (50 g) [contains aloe vera] [DSC]

Chiggerex® Plus: 6% (50 g) [contains aloe]

Foille®: 5% (3.5 g, 14 g, 28 g) [contains chloroxylenol 0.1%, benzyl alcohol; corn oil base]

Pads, topical:

Sting-Kill: 20% (8s) [contains menthol and tartrazine]

Paste, oral:

Orabase® with Benzocaine: 20% (6 g)

Swabs, oral:

Hurricaine®: 20% (6s, 100s) [dye free; wild cherry flavor]

Orajel® Baby Teething: 7.5% (12s) [berry flavor]

Orajel® Medicated Mouth Sore, Orajel® Medicated Toothache: 20% (8s, 12s) [contains tartrazine]

Zilactin® Toothache and Gum Pain: 20% (8s) [grape flavor]

Swabs, topical:

Boil-Ease® Pain Relieving: 20% (12s) [contains tartrazine]

Sting-Kill: 20% (5s) [contains menthol and tartrazine]

Wax, oral:

Dent's Extra Strength Toothache Gum: 20% (1 g)

Generic AvailableYes: Lozenge

Pricing: U.S. (www.drugstore.com)

Gel (Americaine Anesthetic)

20% (28): $22.99

Solution (Oticaine Otic)

20% (15): $18.99

Mechanism of ActionEster local anesthetic blocks both the initiation and conduction of nerve impulses by decreasing the neuronal membrane's permeability to sodium ions, which results in inhibition of depolarization with resultant blockade of conduction

Pharmacodynamics/Kinetics

Absorption: Topical: Poor to intact skin; well absorbed from mucous membranes and traumatized skin

Metabolism: Hepatic (to a lesser extent) and plasma via hydrolysis by cholinesterase

Excretion: Urine (as metabolites)

Dental Health Professional ConsiderationsHealth Canada has issued a reminder to healthcare professionals that benzocaine sprays must be used judiciously to minimize the risk of methemoglobinemia. Almost all reported cases have been associated with higher concentration (14% to 20% benzocaine) spray products used in the mouth and on other mucous membranes. Alternatives to benzocaine sprays, such as topical lidocaine preparations, should be considered for patients at higher risk of this reaction.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsEthyl Aminobenzoate

Benzonatate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ben ZOE na tate)
U.S. Brand NamesTessalon®
Canadian Brand NamesTessalon®
Pharmacologic CategoryAntitussive
Use: Labeled IndicationsSymptomatic relief of nonproductive cough
Dosing: AdultsCough: Oral: 100 mg 3 times/day or every 4 hours up to 600 mg/day
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren >10 years: Refer to adult dosing.
Administration: OralSwallow capsule whole (do not break or chew).
ContraindicationsHypersensitivity to benzonatate, related compounds (such as tetracaine), or any component of the formulation
Geriatric ConsiderationsNo specific geriatric information is available about benzonatate. Avoid use in patients with impaired gag reflex or who cannot swallow the capsule whole.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse Reactions1% to 10%:

Central nervous system: Sedation, headache, dizziness

Dermatologic: Rash

Gastrointestinal: GI upset

Neuromuscular & skeletal: Chest numbness

Ocular: Burning sensation in eyes

Respiratory: Nasal congestion

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersMonitor patient's chest sounds and respiratory pattern
Nursing: Physical Assessment/MonitoringAssess patient response, effectiveness of therapy (relief of cough, lung sounds, and respiratory pattern), and adverse reactions (eg, CNS changes) at beginning of therapy and periodically with long-term use. Teach patient appropriate use, possible side effects/interventions, and adverse symptoms to report.
Patient EducationDo not take any new medications (especially depressants or sleep-inducing agents) without consulting prescriber. Take only as prescribed; do not exceed prescribed dose or frequency. Do not break or chew capsule. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, impaired coordination, blurred vision, or increased anxiety (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or upset stomach or nausea (small, frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help). Report persistent CNS changes (dizziness, sedation, tremor, or agitation); numbness in chest or feeling of chill; visual changes or burning in eyes; numbness of mouth or difficulty swallowing; or lack of improvement or worsening or condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, softgel: 100 mg, 200 mg

Tessalon®: 100 mg, 200 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Capsules (Benzonatate)

100 mg (30): $17.99

200 mg (30): $33.99

Capsules (Tessalon Perles)

100 mg (30): $45.75

Mechanism of ActionTetracaine congener with antitussive properties; suppresses cough by topical anesthetic action on the respiratory stretch receptors
Pharmacodynamics/Kinetics

Onset of action: Therapeutic: 15-20 minutes

Duration: 3-8 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness
Mental Health: Effects on Psychiatric TreatmentMay potentiate sedative effects of sedating psychotropics

Use: Labeled IndicationsTreatment of acne vulgaris and oily skin

Dosing: AdultsAcne vulgaris: Topical: Shake well; apply thin film 1-3 times/day; gently massage into skin

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricAdolescents: Refer to adult dosing.

Allergy Considerations

- Corticosteroid Allergy

Pregnancy Risk FactorC

LactationFor topical use

Adverse ReactionsSee individual agents.

Metabolism/Transport EffectsHydrocortisone: **Substrate** of CYP3A4 (minor); **Induces** CYP3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be

increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agent for Hydrocortisone.
Patient EducationSee individual agent for Hydrocortisone.

Mechanism of ActionReleases free-radical oxygen which oxidizes bacterial proteins in the sebaceous follicles decreasing the number of anaerobic bacteria and decreasing irritating-type free fatty acids

Pharmacodynamics/Kinetics

Absorption: ~5% via skin; gel more penetrating than cream

Metabolism: Converted to benzoic acid in skin

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

International issues:

Didrex® may be confused with Nitrex® which is a brand name for isosorbide mononitrate in Italy

Pronunciation(benz FET a meen)
U.S. Brand NamesDidrex®
Canadian Brand NamesDidrex®
Pharmacologic CategoryAnorexiant; Sympathomimetic
Use: Labeled IndicationsShort-term (few weeks) adjunct in exogenous obesity
Dosing: AdultsObesity (short-term adjunct): Oral: Dose should be individualized based on patient response: Initial: 25-50 mg once daily; titrate to 25-50 mg 1-3 times/day; once-daily dosing should be administered midmorning or midafternoon; maximum dose: 50 mg 3 times/day
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricObesity (short-term adjunct): Children ≥12 years: Refer to adult dosing.
Calculations

- Body Mass Index

Dietary ConsiderationsMost effective when combined with a low calorie diet and behavior modification counseling.
StorageStore at room temperature of 20°C to 25°C (68°F to 77°F).
RestrictionsC-III

Pharmacotherapy for weight loss is recommended only for obese patients with a body mass index ≥30 kg/m^2, or ≥27 kg/m^2 in the presence of other risk factors such as hypertension, diabetes, and/or dyslipidemia or a high waist circumference; therapy should be used in conjunction with a comprehensive weight management program. Rule out organic causes of obesity (eg, untreated hypothyroidism) prior to use.

Note: Benzphetamine is not approved for long-term use. The limited usefulness of medications in this class should be weighed against possible risks associated with their use. Consult weight loss guidelines for current pharmacotherapy recommendations.

ContraindicationsHypersensitivity or idiosyncrasy to benzphetamine or other sympathomimetic amines; advanced arteriosclerosis, symptomatic cardiovascular disease, moderate-to-severe hypertension; pulmonary hypertension; hyperthyroidism; glaucoma; agitated states, history of drug abuse; during or within 14 days following MAO inhibitor therapy, concurrent use with other CNS stimulants; pregnancy
Allergy Considerations

- Amphetamine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Amphetamines may impair the ability to engage in potentially hazardous activities.
- Primary pulmonary hypertension (PPH): A rare, frequently fatal disease of the lungs, PPH has been found to occur with increased frequency in patients receiving some anorexigens.
- Valvular heart disease: The use of some anorexigens has been associated with the development of valvular heart disease. Avoid stimulants in patients with known serious structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, or other serious cardiac problems that could increase the risk of sudden death that these conditions alone carry.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; antidiabetic agent requirements may be altered with anorexigens and concomitant dietary restrictions.
- Hypertension: Use with caution in patients with hypertension and other cardiovascular conditions that might be exacerbated by increases in blood pressure or heart rate.
- Seizure disorders: Use with caution in patients with a history of seizure disorders.
- Tourette's syndrome: Use with caution in patients with Tourette's syndrome; stimulants may unmask tics.

Concurrent drug therapy issues:

- Anorexigens: Safety and efficacy have not been established for use with other weight loss medications, including over-the-counter or herbal products. Not recommended for use in patients who have used other anorectic agents within the past year.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Abuse potential: Benzphetamine is pharmacologically related to the amphetamines, which have a high abuse potential; prolonged use may lead to dependency. Prescriptions should be written for the smallest quantity consistent with good patient care to minimize possibility of overdose.

- Discontinuation of therapy: Discontinue if satisfactory weight loss has not occurred within the first 4 weeks of treatment, or if tolerance develops.

Pregnancy Risk FactorX
Pregnancy ConsiderationsReproduction studies have not been conducted with benzphetamine. Amphetamines are teratogenic and embryotoxic in animal studies.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsAmphetamines are excreted in breast milk.
Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiomyopathy (with chronic amphetamine use), hypertension, palpitation, tachycardia

Central nervous system: Depression (with withdrawal), dizziness, headache, insomnia, nervousness, psychosis, restlessness

Dermatologic: Urticaria

Endocrine & metabolic: Libido changes

Gastrointestinal: Diarrhea, nausea, unpleasant taste, xerostomia

Neuromuscular & skeletal: Tremor

Ocular: Mydriasis

Miscellaneous: Diaphoresis, tachyphylaxis

Metabolism/Transport Effects**Substrate** of CYP2B6 (minor), 3A4 (major)
Drug Interactions

Alkalinizing Agents: May decrease the excretion of Amphetamines. *Risk D: Consider therapy modification*

Ammonium Chloride: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

Analgesics (Opioid): Amphetamines may enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Antihistamines: Amphetamines may diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antipsychotics: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Amphetamines. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ethosuximide: Amphetamines may diminish the therapeutic effect of Ethosuximide. Amphetamines may decrease the serum concentration of Ethosuximide. *Risk C: Monitor therapy*

Gastrointestinal Acidifying Agents: May decrease the serum concentration of Amphetamines. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Methenamine: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

PHENobarbital: Amphetamines may decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Phenytoin: Amphetamines may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions Herb/Nutraceutical: St John's wort may decrease benzphetamine levels.

Monitoring Parameters Weight, waist circumference, blood pressure

Reference Range

Adult classification of weight by BMI (kg/m^2):

Underweight: <18.5

Normal: 18.5-24.9

Overweight: 25-29.9

Obese, class I: 30-34.9

Obese, class II: 35-39.9

Extreme obesity (class III): ≥40

Waist circumference: In adults with a BMI of 25-34.9 kg/m^2, high-risk waist circumference is defined as:

Men >102 cm (>40 in)

Women >88 cm (>35 in)

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 50 mg

Didrex®: 50 mg

Generic Available Yes

Pricing: U.S. (www.drugstore.com)

Tablets (Didrex)

50 mg (90): $137.98

Mechanism of Action Benzphetamine is a sympathomimetic amine with pharmacologic properties similar to the amphetamines. The mechanism of action in reducing appetite appears to be secondary to CNS effects, including stimulation of the hypothalamus to release norepinephrine.

Related Information

- Obesity Treatment Guidelines for Adults

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and metallic taste.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Use with caution since amphetamines have actions similar to epinephrine and norepinephrine

Index Terms Benzphetamine Hydrochloride

International Brand Names Didrex (CA)

Benztropine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Benztropine may be confused with bromocriptine

Pronunciation(BENZ troe peen)
U.S. Brand NamesCogentin®
Canadian Brand NamesApo-Benztropine®
Pharmacologic CategoryAnti-Parkinson's Agent, Anticholinergic; Anticholinergic Agent
Use: Labeled IndicationsAdjunctive treatment of Parkinson's disease; treatment of drug-induced extrapyramidal symptoms (except tardive dyskinesia)
Dosing: Adults

Drug-induced extrapyramidal symptom: Oral, I.M., I.V.: 1-4 mg/dose 1-2 times/day

Acute dystonia: I.M., I.V.: 1-2 mg

Parkinsonism: Oral: 0.5-6 mg/day in 1-2 divided doses; if one dose is greater, give at bedtime. Titrate dose in 0.5 mg increments at 5- to 6-day intervals.

Dosing: ElderlyOral: Initial: 0.5 mg once or twice daily; titrate dose in 0.5 mg increments at every 5-6 days; maximum: 4 mg/day.
Dosing: Pediatric**Note:** Use in children ≤3 years of age should be reserved for life-threatening emergencies.

Drug-induced extrapyramidal symptoms: Oral, I.M., I.V.: Children >3 years: 0.02-0.05 mg/kg/dose 1-2 times/day

Administration: I.V. DetailpH: 5-8
Compatibility

Y-site administration: Compatible: Fluconazole, tacrolimus.

Compatibility in syringe: Compatible: Chlorpromazine, fluphenazine, metoclopramide, perphenazine. **Variable (consult detailed reference):** Haloperidol.

ContraindicationsHypersensitivity to benztropine or any component of the formulation; pyloric or duodenal obstruction, stenosing peptic ulcers; bladder neck obstructions; achalasia; myasthenia gravis; children <3 years of age
Allergy Considerations

- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anhidrosis/hyperthermia: May cause anhidrosis and hyperthermia, which may be severe; use with caution in hot weather or during exercise. The risk is increased in hot environments, particularly in the elderly, alcoholics, patients with CNS disease, and those with prolonged outdoor exposure.
- CNS effects: May be associated with confusion or hallucinations (generally at higher dosages); intensification of symptoms or toxic psychosis may occur in patients with mental disorders. May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Weakness: When given in large doses or to susceptible patients, may cause weakness and inability to move particular muscle groups.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with tachycardia, cardiac arrhythmias, hypertension, or hypotension.
- GI obstruction: Use with caution in patients with obstructive disease of the GI.
- Glaucoma: Use with caution in patients with glaucoma.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture or retention.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Elderly: Frequently develop increased sensitivity and require strict dosage regulation; side effects may be more severe in elderly patients with atherosclerotic changes.

- Pediatrics: Use with caution in older children; dose has not been established.

Other warnings/precautions:

- Tardive dyskinesia: Does not relieve symptoms of tardive dyskinesia.

Geriatric ConsiderationsAnticholinergic agents are generally not well tolerated in the elderly (often results in bowel, bladder, and CNS adverse effects) and their use should be avoided when possible. In the elderly, anticholinergic agents should not be used as prophylaxis against extrapyramidal symptoms.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Tachycardia

Central nervous system: Confusion, disorientation, memory impairment, toxic psychosis, visual hallucinations

Dermatologic: Rash

Endocrine & metabolic: Heat stroke, hyperthermia

Gastrointestinal: Constipation, dry throat, ileus, nasal dryness, nausea, vomiting, xerostomia

Genitourinary: Urinary retention, dysuria

Ocular: Blurred vision, mydriasis

Miscellaneous: Fever

Metabolism/Transport Effects**Substrate** of CYP2D6 (minor)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Monitoring ParametersSymptoms of EPS or Parkinson's, pulse, anticholinergic effects
Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and at regular intervals throughout therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Patient EducationTake exactly as directed; do not increase, decrease, or discontinue this medicine without consulting prescriber. Take at the same time each day. Do not use alcohol and any prescription or OTC sedatives or CNS depressants without consulting prescriber. You may experience drowsiness, dizziness, confusion, and blurred vision (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); increased susceptibility to heat stroke, decreased perspiration (use caution in hot weather, maintain adequate fluids and reduce exercise activity); or constipation (increased exercise, fluids, fruit, or fiber may help). Report unresolved nausea, vomiting, or gastric disturbances; rapid or pounding heartbeat, chest pain, or palpitation; respiratory difficulty; CNS changes (hallucination, loss of memory, nervousness, etc); eye pain; prolonged fever; painful or difficult urination; unresolved constipation; increased muscle spasticity or rigidity; skin rash; or significant worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as mesylate (Cogentin®): 1 mg/mL (2 mL)

Tablet, as mesylate: 0.5 mg, 1 mg, 2 mg

Generic AvailableYes: Tablet
Pricing: U.S. (www.drugstore.com)

Tablets (Benztropine Mesylate)

0.5 mg (60): $15.99

1 mg (60): $15.99

2 mg (90): $22.99

Mechanism of Action Possesses both anticholinergic and antihistaminic effects. *In vitro* anticholinergic activity approximates that of atropine; *in vivo* it is only about half as active as atropine. Animal data suggest its antihistaminic activity and duration of action approach that of pyrilamine maleate. May also inhibit the reuptake and storage of dopamine, thereby prolonging the action of dopamine.

Pharmacodynamics/Kinetics

Onset of action: Oral: Within 1 hour; Parenteral: Within 15 minutes

Duration: 6-48 hours

Metabolism: Hepatic (N-oxidation, N-dealkylation, and ring hydroxylation)

Bioavailability: 29%

Related Information

- Antiparkinsonian Agents
- Discontinuation of Psychotropic Drugs
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy Pearls No significant difference in onset of I.M. or I.V. injection, therefore, there is usually no need to use the I.V. route. Improvement is sometimes noticeable a few minutes after injection.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), dry throat, and nasal dryness (very prevalent).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health Comment Along with diphenhydramine, benztropine is considered the drug of choice for patients with acute dystonic reactions. The usual adult dosage is I.M. 2 mg. In an emergency situation (laryngeal spasm), it should be given intravenously. Benztropine has a long duration of action and may be given once daily, preferable at bedtime due to possible sedation when used to treat pseudoparkinsonism and akathisia.

Benzydamine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ben ZID a meen)

Canadian Brand NamesApo-Benzydamine®; Dom-Benzydamine; Novo-Benzydamine; PMS-Benzydamine; ratio-Benzydamine; Sun-Benz®; Tantum®

Pharmacologic CategoryLocal Anesthetic, Oral

Use: Labeled IndicationsSymptomatic treatment of pain associated with acute pharyngitis; treatment of pain associated with radiation-induced oropharyngeal mucositis

Use: DentalSymptomatic treatment of pain associated with acute pharyngitis; treatment of pain associated with radiation-induced oropharyngeal mucositis

Dosing: Adults

Acute pharyngitis: Oral rinse: Gargle with 15 mL of undiluted solution every $1^{1}/_{2}$-3 hours until symptoms resolve. Patient should expel solution from mouth following use; solution should not be swallowed.

Mucositis: Oral rinse: 15 mL of undiluted solution as a gargle or rinse 3-4 times/day; contact should be maintained for at least 30 seconds, followed by expulsion from the mouth. Clinical studies maintained contact for ~2 minutes, up to 8 times/day. Patient should not swallow the liquid. Begin treatment 1 day prior to initiation of radiation therapy and continue daily during treatment. Continue oral rinse treatments after the completion of radiation therapy until desired result/healing is achieved.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment required.

StorageStore at 15°C to 30°C. Protect from freezing.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to benzydamine or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Irritation/burning: May cause local irritation and/or burning sensation in patients with altered mucosal integrity; dilution (1:1 in warm water) may attenuate this effect.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children ≤5 years of age.

Pregnancy ConsiderationsSafety has not been established in pregnant women. Use only when potential benefit outweighs possible risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

Central nervous system: Drowsiness, headache

Gastrointestinal: Nausea and/or vomiting (2%), dry mouth

Local: Numbness (10%), burning/stinging sensation (8%)

Respiratory: Pharyngeal irritation, cough

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 2C19, 2D6, 3A4

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Oral rinse: 0.15% (100 mL, 250 mL) [not available in the U.S.]

Generic AvailableYes

Mechanism of ActionLocal anesthetic and anti-inflammatory, reduces local pain and inflammation. Does not interfere with arachidonic acid metabolism.

Pharmacodynamics/Kinetics

Absorption: Oral rinse may be absorbed, at least in part, through the oral mucosa

Excretion: Urine (primarily as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Numbness, burning/stinging sensation, and xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsBenzydamine Hydrochloride

Benzylpenicilloyl-polylysine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(BEN zil pen i SIL oyl pol i LIE seen)

U.S. Brand NamesPre-Pen® [DSC]

Pharmacologic CategoryDiagnostic Agent

Use: Labeled IndicationsAdjunct in assessing the risk of administering penicillin (penicillin or benzylpenicillin) in adults with a history of clinical penicillin hypersensitivity

Dosing: AdultsDiagnostic aid for penicillin allergy: PPL is administered by a scratch technique or by intradermal injection. For initial testing, PPL should always be applied via the scratch technique. **Do not administer intradermally to patients who have positive reactions to a scratch test.** PPL test alone does not identify those patients who react to a minor antigenic determinant and does not appear to predict reliably the occurrence of late reactions.

Scratch test: Use scratch technique with a 20-gauge needle to make 3-5 mm nonbleeding scratch on epidermis, apply a small drop of solution to scratch, rub in gently with applicator or toothpick. A positive reaction consists of a pale wheal surrounding the scratch site which develops within 10 minutes and ranges from 5-15 mm or more in diameter.

Intradermal test: Use intradermal test with a tuberculin syringe with a 26- to 30-gauge short bevel needle; a dose of 0.01-0.02 mL is injected intradermally. A control of 0.9% sodium chloride should be injected at least 1.5" from the PPL test site. Most skin responses to the intradermal test will develop within 5-15 minutes.

Interpretation:

(-) Negative: No reaction

(±) Ambiguous: Wheal only slightly larger than original bleb with or without erythematous flare and larger than control site

(+) Positive: Itching and marked increase in size of original bleb

Control site should be reactionless

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: OtherPPL is administered by a scratch technique or by intradermal injection. For initial testing, PPL should always be applied via the scratch technique. Do not give intradermally to patients who have positive reactions to a scratch test. Have epinephrine 1:1000 immediately available.

StorageRefrigerate; discard if left at room temperature for longer than 1 day.

ContraindicationsKnown hypersensitivity to penicillin or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Allergic reactions: PPL test alone does not identify those patients who react to a minor antigenic determinant and does not appear to predict reliably the occurrence of late reactions. A negative skin test is associated with an incidence of allergic reactions <5% after penicillin administration and a positive skin test is associated with a >20% incidence of allergic reaction after penicillin administration; have epinephrine 1:1000 available.

Pregnancy Risk FactorC

Pregnancy ConsiderationsSafety for use during pregnancy has not been established.

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension

Dermatologic: Angioneurotic edema, pruritus, erythema, urticaria

Local: Intense local inflammatory response at skin test site, wheal (locally)

Respiratory: Dyspnea

Miscellaneous: Systemic allergic reactions occur rarely

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution: 6 x 10^{-5} M (0.25 mL) [DSC]

Generic AvailableNo

Mechanism of ActionElicits IgE antibodies which produce type I accelerate urticarial reactions to penicillins

Related Information

- Skin Tests

Beractant

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Survanta® may be confused with Sufenta®

Pronunciation(ber AKT ant)

U.S. Brand NamesSurvanta®

Canadian Brand NamesSurvanta®

Pharmacologic CategoryLung Surfactant

Use: Labeled IndicationsPrevention and treatment of respiratory distress syndrome (RDS) in premature infants

Prophylactic therapy: Body weight <1250 g in infants at risk for developing, or with evidence of, surfactant deficiency (administer within 15 minutes of birth)

Rescue therapy: Treatment of infants with RDS confirmed by x-ray and requiring mechanical ventilation (administer as soon as possible - within 8 hours of age)

Dosing: Pediatric

Respiratory distress treatment:

Prophylactic treatment: Intratracheal: Administer 100 mg phospholipids (4 mL/kg) as soon as possible; as many as 4 doses may be administered during the first 48 hours of life, no more frequently than 6 hours apart. The need for additional doses is determined by evidence of continuing respiratory distress; if the infant is still intubated and requiring at least 30% inspired oxygen to maintain a PaO_2 ≤80 torr.

Rescue treatment: Intratracheal: Administer 100 mg phospholipids (4 mL/kg) as soon as the diagnosis of RDS is made; may repeat if needed, no more frequently than every 6 hours to a maximum of 4 doses

Administration: Other

For intratracheal administration only

Suction infant prior to administration. Inspect solution to verify complete mixing of the suspension.

Administer intratracheally by instillation through a 5-French end-hole catheter inserted into the infant's endotracheal tube.

Administer the dose in four 1 mL/kg aliquots. Each quarter-dose is instilled over 2-3 seconds; each quarter-dose is administered with the infant in a different position. Slightly downward inclination with head turned to the right, then repeat with head turned to the left; then slightly upward inclination with head turned to the right, then repeat with head turned to the left.

Storage**Refrigerate**; protect from light. Prior to administration, warm by standing at room temperature for 20 minutes or held in hand for 8 minutes. **Artificial warming methods should not be used.** Unused, unopened vials warmed to room temperature may be returned to the refrigerator within 8 hours of warming only once.

Warnings/Precautions

Concerns related to adverse effects:

- Transient adverse effects: Transient episodes of bradycardia and decreased oxygen saturation occur. Discontinue dosing procedure and initiate measures to alleviate the condition; may reinstitute after the patient is stable.

Other warnings/precautions:

- Administration: For intratracheal administration only.

- Monitoring: Produces rapid improvements in lung oxygenation and compliance that may require frequent adjustments to oxygen delivery and ventilator settings.

- Trained personnel: Rapidly affects oxygenation and lung compliance; restrict use to a highly-supervised clinical setting with immediate availability of clinicians experienced in intubation and ventilatory management of premature infants.

Adverse ReactionsDuring the dosing procedure:

>10%: Cardiovascular: Transient bradycardia

1% to 10%: Respiratory: Oxygen desaturation

<1%: Apnea, endotracheal tube blockage, hypercarbia, hypertension, hypocarbia, hypotension, pallor, pulmonary air leaks, pulmonary interstitial emphysema, post-treatment nosocomial sepsis probability increased, vasoconstriction

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersContinuous ECG and transcutaneous O_2 saturation should be monitored during administration; frequent arterial blood gases are necessary to prevent postdosing hyperoxia and hypocarbia

Monitoring: Lab TestsContinuous ECG and transcutaneous O_2 saturation should be monitored during administration; frequent arterial blood gases are necessary to prevent postdosing hyperoxia and hypocarbia

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, intratracheal [preservative free; bovine derived]:

Survanta®: 25 mg/mL (4 mL, 8 mL)

Generic AvailableNo

ManufacturerRoss Laboratories

Mechanism of ActionReplaces deficient or ineffective endogenous lung surfactant in neonates with respiratory distress syndrome (RDS) or in neonates at risk of developing RDS. Surfactant prevents the alveoli from collapsing during expiration by lowering surface tension between air and alveolar surfaces.

Pharmacodynamics/KineticsExcretion: Clearance: Alveolar clearance is rapid

Pharmacotherapy PearlsEach mL contains 25 mg phospholipids suspended in 0.9% sodium chloride solution. Contents of 1 mL: 0.5-1.75 mg triglycerides, 1.4-3.5 mg free fatty acids, and <1 mg protein.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

U.S. Brand NamesA-Caro-25; B-Caro-T™; Lumitene™
Pharmacologic CategoryVitamin, Fat Soluble
Use: Unlabeled/InvestigationalProphylaxis and treatment of polymorphous light eruption; prophylaxis against photosensitivity reactions in erythropoietic protoporphyria
Dosing: Adults(Non-FDA-approved uses) Prophylaxis and treatment of polymorphous light eruption; prophylaxis against photosensitivity reactions in erythropoietic protoporphyria: Oral: 30-300 mg/day
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricOral: <14 years: 30-150 mg/day
Dietary ConsiderationsMay be taken with meals.
ContraindicationsHypersensitivity to beta-carotene or any component of the formulation
Allergy Considerations

- Retinoid Allergy

Warnings/Precautions

Disease-related concerns:

• Hepatic impairment: Use with caution in patients with hepatic impairment.

• Renal impairment: Use with caution in patients with renal impairment.

Other warnings/precautions:

• Sunscreen use: Not proven effective as a sunscreen.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%: Dermatologic: Carotenodermia (yellowing of palms, hands, or soles of feet, and to a lesser extent the face)

<1%: Dizziness, bruising, diarrhea, arthralgia

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersHepatic and renal function
Nursing: Physical Assessment/MonitoringMonitor hepatic and renal function with long-term use. Assess knowledge/teach patient appropriate use, possible side effects, and adverse symptoms to report.
Monitoring: Lab TestsHepatic and renal function
Patient EducationTake exactly as directed; do not take more than the recommended dose. Take with meals. Do not take additional vitamins without consulting prescriber. Skin may appear slightly yellow-orange. Not a proven sunblock. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, softgel: 10,000 int. units (6 mg); 25,000 int. units (15 mg)

A-Caro-25: 25,000 int. units (15 mg) [contains soy]

B-Caro-T™: 25,000 int. units (15 mg) [contains soybean lecithin and soybean oil]

Capsule:

Lumitene™: 50,000 int. units (30 mg)

Tablet: 10,000 int. units

Generic AvailableYes
Mechanism of ActionThe exact mechanism of action in erythropoietic protoporphyria has not as yet been elucidated; although patient must become carotenemic before effects are observed, there appears to be more than a simple internal light screen responsible for the drug's action. A protective effect was achieved when beta-carotene was added to blood samples. The concentrations of solutions used were similar to those achieved in treated patients. Topically applied beta-carotene is considerably less effective than systemic therapy.
Pharmacodynamics/Kinetics

Metabolism: Prior to absorption, converted to vitamin A in the wall of the small intestine, then oxidized to retinoic acid and retinol in the presence of fat and bile acids; small amounts are then stored in the liver; retinol (active) is conjugated with glucuronic acid

Excretion: Urine and feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsThere is no compelling evidence that supplemental antioxidant therapy has a role in the primary prevention of cardiovascular disease. The role of antioxidant therapy in secondary prevention has also not been established, in part, because of a lack of concordance between studies, reports of increased risk with specific antioxidants (eg, beta-carotene), not fully understanding the underlying pathophysiologic mechanisms, and the use of different doses or combinations of antioxidants. In general, secondary prevention trials evaluating vitamin E have shown the most promise. However, a recent trial (HOPE) demonstrated no cardiovascular benefit from the use of vitamin E in patients with or at risk for coronary artery disease. Until further outcome trials establish the role of vitamin E and possible other antioxidants for the secondary prevention of cardiovascular disease, patients should be encouraged to follow a balanced diet that is rich in antioxidants (eg, citrus fruits, vegetables, whole grains).

Pharmacologic CategoryHistamine H_1 Agonist
Use: Labeled IndicationsTreatment of Ménière's disease (to decrease episodes of vertigo)
Dosing: AdultsMénière's disease: Oral: 8-16 mg 3 times/day. Administration with meals is recommended.
Dosing: ElderlyRefer to adult dosing.
Administration: OralAdministration with meals is recommended.
Dietary ConsiderationsShould be taken with food.
StorageStore at 15°C to 30°C.
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to betahistine or any component of the formulation; peptic ulcer disease; pheochromocytoma
Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Respiratory disease: Use with caution in patients with respiratory diseases, including asthma and COPD with bronchospastic component.

Concurrent drug therapy issues:

- Antihistamines: Avoid concurrent use with antihistamines.

Special populations:

- Pediatrics: Not recommended for use in children.

Pregnancy Risk FactorNot available
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Should be used only when potential benefit to the woman outweighs possible risk to fetus.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Central nervous system: Headache, somnolence (case reports)

Cardiovascular: Ventricular extrasystoles (case reports)

Dermatologic; Rash, pruritus, urticaria

Gastrointestinal: Dyspepsia, nausea, peptic ulcer disease (including exacerbation of previous disease)

Drug Interactions

Antihistamines: May diminish the therapeutic effect of Betahistine. **Exceptions:** Epinastine; Ketotifen; Levocabastine; Olopatadine. *Risk C: Monitor therapy*

Beta2-Agonists: Betahistine may diminish the therapeutic effect of Beta2-Agonists. *Risk C: Monitor therapy*

> *Children ≥3 years:* Refer to adult dosing.
>
> **Note:** Dosage in all patients can be gradually increased until plasma total homocysteine is undetectable or present only in small amounts. One study in six patients with CBS deficiency, ranging from 6-17 years of age, showed minimal benefit from exceeding a twice daily dosing schedule and a 150 mg/kg/day dosage.

Administration: OralMeasure prescribed amount with provided measuring scoop and dissolve in 120-180 mL of water for immediate ingestion.
Dietary ConsiderationsBetaine is a metabolite of choline and is present in small amounts in foods such as beets, spinach, cereals, and seafood.
StorageStore at 15°C to 30°C (59°F to 86°F). Protect from moisture
ContraindicationsHypersensitivity to betaine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Cerebral edema: May be associated with hypermethioninemia.

Special populations:

- Cystathionine beta-synthase (CBS) deficiency: Use caution in patients with CBS deficiency; treatment with betaine may cause large increases of plasma methionine concentrations.

Other warnings/precautions:

- Experienced personnel: Use of betaine should be limited to healthcare providers knowledgable in treating patients with homocystinuria.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with betaine. It is not known whether betaine can cause fetal harm when administered to a pregnant woman or can affect reproductive capacity. Betaine should be given to a pregnant woman only if needed.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsBetaine is found naturally in human breast milk. The influence from betaine therapy is unknown.
Adverse Reactions

Frequency not defined: Gastrointestinal: Diarrhea, GI distress, nausea

Postmarketing and/or case reports: Cerebral edema (associated with hypermethioninemia)

Drug InteractionsThere are no known significant interactions.

Monitoring Parameters

Total plasma homocysteine levels to determine therapeutic response. In patients with elevated plasma methionine (eg, CBS deficiency), monitor plasma methionine (maintain <1000 micromol/L).

Monitoring: Lab TestsTotal plasma homocysteine levels to determine therapeutic response. In patients with elevated plasma methionine (eg, CBS deficiency), monitor plasma methionine (maintain <1000 micromol/L).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for oral solution, anhydrous:

Cystadane®: 1 g/scoop (180 g) [1 scoop = 1.7 mL]

Generic AvailableNo

Mechanism of ActionBetaine acts as a methyl group donor in the remethylation of homocysteine to methionine. Homocystinuria is an inborn error of metabolism in which elevated plasma homocysteine levels can lead to mental retardation, ocular abnormalities, osteoporosis, premature atherosclerosis and thromboembolic disease. Remethylation is one of the two divergent pathways in the metabolism of homocysteine. The second pathway involves transsulfuration of homocysteine to produce cysteine. A number of enzymes and cofactors are also involved in these pathways.

Pharmacotherapy PearlsBetaine has been used in conjunction with vitamin B_6 (pyridoxine), vitamin B_{12} (cobalamin), and folate in the management of homocystinuria.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Clotrimazole may be confused with co-trimoxazole

Lotrisone® may be confused with Lotrimin®

Pronunciation(bay ta METH a sone & kloe TRIM a zole)

U.S. Brand NamesLotrisone®

Canadian Brand NamesLotriderm®

Pharmacologic CategoryAntifungal Agent, Topical; Corticosteroid, Topical

Use: Labeled IndicationsTopical treatment of various dermal fungal infections (including tinea pedis, cruris, and corpora in patients ≥17 years of age)

Use: DentalTreatment of a variety of oral diseases of allergic, inflammatory, or autoimmune origin

Dosing: Adults

Allergic or inflammatory diseases: Topical: Apply to affected area twice daily, morning and evening

Tinea corporis, tinea cruris: Topical: Massage into affected area twice daily, morning and evening. Do not use for longer than 2 weeks; re-evaluate after 1 week if no clinical improvement. Do not exceed 45 g cream/week or 45 mL lotion/week.

Tinea pedis: Topical: Massage into affected area twice daily, morning and evening. Do not use for longer than 4 weeks; re-evaluate after 2 weeks if no clinical improvement. Do not exceed 45 g cream/week or 45 mL lotion/week.

Dosing: ElderlyRefer to adult dosing. Use with caution. Skin atrophy and skin ulceration (rare) have been reported in patients with thinning skin. Do not use for diaper dermatitis or under occlusive dressings.

Dosing: Pediatric

Children <17 years: Do not use.

Children ≥17 years: Refer to adult dosing.

Administration: TopicalFor external use only. Do not use on open wounds. Do not cover with occlusive dressings. Shake lotion well prior to use

Storage

Cream: Store at controlled room temperature of 25°C (77°F).

Lotion: Store upright at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to betamethasone, clotrimazole, other corticosteroids or imidazoles, or any component of the formulation

Allergy Considerations

- Azole Antifungal Allergy
- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Disease-related concerns:

- Diaper dermatitis: Do not use for diaper dermatitis; adverse reactions associated with corticosteroids have occurred.

Special populations:

- Elderly: Use topical corticosteroids with caution in the elderly; skin atrophy and, rarely, skin ulcerations have been reported.

- Pediatrics: Safety and efficacy have not been established in children <17 years of age; striae and growth suppression have been reported with use in infants and children.

Other warnings/precautions:

- Appropriate use: For topical use only; do not use intravaginally. Avoid contact with eyes or mouth. Do not use occlusive dressings; discontinue use if irritation occurs.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies using topical betamethasone during pregnancy. However, intrauterine growth retardation has been reported with another topical steroid. Avoid use in large amounts for long periods of time during pregnancy. Clotrimazole is poorly absorbed when used topically.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsBetamethasone: Systemic corticosteroids are excreted in human milk. The extent of topical absorption is variable. Use with caution while breast-feeding; do not apply to nipples.

Adverse ReactionsAlso see individual agents.

1% to 10%:

Dermatologic: Dry skin (2%)

Local: Burning (2%)

Neuromuscular & skeletal: Paresthesia (2%)

<1%: Edema, rash, secondary infection, stinging. Cushing's syndrome (HPA axis suppression), growth suppression, intracranial hypertension (benign), and skin atrophy have also been reported with use in children.

Postmarketing and/or case reports: Skin ulceration (rare)

Metabolism/Transport Effects

Betamethasone: **Inhibits** CYP3A4 (weak)

Clotrimazole: **Inhibits** CYP1A2 (weak), 2A6 (weak), 2B6 (weak), 2C8/9 (weak), 2C19 (weak), 2D6 (weak), 2E1 (weak), 3A4 (moderate)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Monitoring ParametersUrinary free cortisol test, morning plasma cortisol test, and ACTH stimulation test may be used to evaluate HPA axis suppression; signs of infection

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsUrinary free cortisol test, morning plasma cortisol test, and ACTH stimulation test may be used to evaluate HPA axis suppression

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream: Betamethasone dipropionate 0.05% (base) and clotrimazole 1% (15 g, 45 g) [contains benzyl alcohol]

Lotrisone®: Betamethasone dipropionate 0.05% (base) and clotrimazole 1% (15 g, 45 g) [contains benzyl alcohol]

Lotion: Betamethasone dipropionate 0.05% (base) and clotrimazole 1% (30 mL) [contains benzyl alcohol]

Lotrisone®: Betamethasone dipropionate 0.05% (base) and clotrimazole 1% (30 mL) [contains benzyl alcohol]

Generic AvailableYes

ManufacturerSchering/Key

Pricing: U.S. (www.drugstore.com)

Cream (Clotrimazole-Betamethasone)

1-0.05% (15): $14.99

1-0.05% (45): $35.99

Lotion (Clotrimazole-Betamethasone)

1-0.05% (30): $39.99

Lotion (Lotrisone)

1-0.05% (30): $76.99

Mechanism of ActionBetamethasone dipropionate is a corticosteroid which controls the rate of protein synthesis; depresses the migration of polymorphonuclear leukocytes, fibroblasts; reverses capillary permeability and lysosomal stabilization at the cellular level to prevent or control inflammation. Clotrimazole is an antifungal agent that binds to phospholipids in the fungal cell membrane altering cell wall permeability resulting in loss of essential intracellular elements.

Pharmacodynamics/KineticsSee individual agents.

Medication Safety Issues

Sound-alike/look-alike issues:

Luxiq® may be confused with Lasix®

International issues:

Beta-Val® may be confused with Betanol® which is a brand name for metipranolol in Monaco

Pronunciation(bay ta METH a sone)

U.S. Brand NamesBeta-Val®; Celestone®; Celestone® Soluspan®; Diprolene®; Diprolene® AF; Luxiq®

Canadian Brand NamesBetaderm; Betaject™; Betnesol®; Betnovate®; Celestone® Soluspan®; Diprolene® Glycol; Diprosone®; Ectosone; Prevex® B; Taro-Sone®; Topilene®; Topisone®; Valisone® Scalp Lotion

Pharmacologic CategoryCorticosteroid, Systemic; Corticosteroid, Topical

Use: Labeled IndicationsInflammatory dermatoses such as seborrheic or atopic dermatitis, neurodermatitis, anogenital pruritus, psoriasis, inflammatory phase of xerosis

Use: Unlabeled/InvestigationalAccelerate fetal lung maturation in patients with preterm labor

Use: DentalTreatment of a variety of oral diseases of allergic, inflammatory, or autoimmune origin

Dosing: AdultsBase dosage on severity of disease and patient response

Inflammatory conditions:

Oral: 2.4-4.8 mg/day in 2-4 doses; range: 0.6-7.2 mg/day

I.M.: Betamethasone sodium phosphate and betamethasone acetate: 0.6-9 mg/day (generally, $^{1}/_{3}$ to $^{1}/_{2}$ of oral dose) divided every 12-24 hours

Psoriasis (scalp): Topical (foam): Apply to the scalp twice daily, once in the morning and once at night.

Rheumatoid arthritis/osteoarthritis:

Intrabursal, intra-articular, intradermal: 0.25-2 mL

Intralesional:

Very large joints: 1-2 mL

Large joints: 1 mL

Medium joints: 0.5-1 mL

Small joints: 0.25-0.5 mL

Steroid-responsive dermatoses: Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.

Gel, augmented formulation: Apply once or twice daily; rub in gently. **Note:** Do not exceed 2 weeks of treatment or 50 g/week.

Lotion: Apply a few drops twice daily

Augmented formulation: Apply a few drops once or twice daily; rub in gently. **Note:** Do not exceed 2 weeks of treatment or 50 mL/week.

Cream/ointment: Apply once or twice daily

Augmented formulation: Apply once or twice daily. **Note:** Do not exceed 2 weeks of treatment or 45 g/week.

Dosing: ElderlyRefer to adult dosing. Use the lowest effective dose.

Dosing: PediatricBase dosage on severity of disease and patient response.

Inflammatory conditions:Note: Use lowest dose listed as initial dose for adrenocortical insufficiency (physiologic replacement).

I.M.:

Children ≤12 years: 0.0175-0.125 mg base/kg/day divided every 6-12 hours **or** 0.5-7.5 mg base/m^2/day divided every 6-12 hours

Children >13 years: Refer to adult dosing.

Oral:

Children ≤12 years: 0.0175-0.25 mg/kg/day divided every 6-8 hours **or** 0.5-7.5 mg/m^2/day divided every 6-8 hours

Children >13 years: Refer to adult dosing.

Topical: Children ≥13 years (use in children ≤12 years is not recommended): Use minimal amount for shortest period of time to avoid HPA axis suppression

Steroid-responsive dermatoses: Topical: Refer to adult dosing

Dosing: Hepatic ImpairmentAdjustments may be necessary in patients with liver failure because betamethasone is extensively metabolized in the liver

Calculations

- Body Surface Area: Pediatrics
- Corticosteroid Conversion

Administration: I.M.Do **not** give injectable sodium phosphate/acetate suspension I.V.

Administration: OralNot for alternate day therapy; once daily doses should be given in the morning.

Administration: TopicalApply topical sparingly to areas. Not for use on broken skin or in areas of infection. Do not apply to wet skin unless directed; do not cover with occlusive dressing. Do not apply very high potency agents to face, groin, axillae, or diaper area.

Foam: Invert can and dispense a small amount onto a saucer or other cool surface. Do not dispense directly into hands. Pick up small amounts of foam and gently massage into affected areas until foam disappears. Repeat until entire affected scalp area is treated.

Dietary ConsiderationsMay be taken with food to decrease GI distress.

Compatibility

Y-site administration: Compatible: Heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

ContraindicationsHypersensitivity to betamethasone, other corticosteroids, or any component of the formulation; systemic fungal infections; I.M. administration contraindicated in idiopathic thrombocytopenia purpura

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections. In stressful situations, HPA axis-suppressed patients should receive adequate supplementation with natural glucocorticoids (hydrocortisone or cortisone) rather than betamethasone (due to lack of mineralocorticoid activity).

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox should be avoided; corticosteroids should not be used to treat ocular herpes simplex. Corticosteroids should not be used for cerebral malaria or viral hepatitis. Close observation is required in patients with latent tuberculosis and/or TB reactivity; restrict use in active TB (only in conjunction with antituberculosis treatment).

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Myopathy: Acute myopathy has been reported with high dose corticosteroids, usually in patients with neuromuscular transmission disorders; may involve ocular and/or respiratory muscles; monitor creatine kinase; recovery may be delayed.

- Psychiatric disturbances: Corticosteroid use may cause psychiatric disturbances, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

- Skin reactions: Discontinue if skin irritation or contact dermatitis should occur; do not use in patients with decreased skin circulation.

Disease-related issues:

- Cardiovascular disease: Use with caution in patients with HF; long-term use has been associated with fluid retention and hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose production/regulation leading to hyperglycemia.

- Gastrointestinal disease: Use with caution in patients with GI diseases (diverticulitis, peptic ulcer, ulcerative colitis) due to perforation risk.

- Head injury: Increased mortality was observed in patients receiving high-dose I.V. methylprednisolone; high-dose corticosteroids should not be used for the management of head injury.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; long-term use has been associated with fluid retention.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms has occurred especially during initial treatment with corticosteroids.

- Myocardial infarction (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.

- Ocular disease: Use with caution in patients with cataracts and/or glaucoma; increased intraocular pressure, open-angle glaucoma, and cataracts have occurred with prolonged use. Consider routine eye exams in chronic users.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Renal impairment: Use with caution in patients with renal impairment; fluid retention may occur.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Elderly: Because of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly in the smallest possible effective dose for the shortest duration.

- Pediatrics: May affect growth velocity; growth should be routinely monitored in pediatric patients. Topical use in patients ≤12 years of age is not recommended.

Dosage form specific issues:

- Topical: Do not use occlusive dressings on weeping or exudative lesions and general caution with occlusive dressings should be observed; adverse effects may be increased.

- Very high potency topical products: Not for treatment of rosacea, perioral dermatitis; not for use on face, groin, or axillae; not for use in a diapered area. Avoid concurrent use of other corticosteroids.

Other warnings/precautions:

- Discontinuation of therapy: Withdraw therapy with gradual tapering of dose.

Geriatric ConsiderationsBecause of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly, in the smallest possible dose, and for the shortest possible time.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed with corticosteroids in animal reproduction studies. Betamethasone crosses the placenta; approximately 25% is metabolized by placental enzymes to an inactive metabolite. Due to its positive effect on stimulating fetal lung maturation, the injection is often used in patients with premature labor (24-34 weeks gestation). Topical products are not recommended for extensive use, in large quantities, or for long periods of time in pregnant women. Some studies have shown an association between first trimester systemic corticosteroid use and oral clefts; adverse events in the fetus/neonate have been noted in case reports following large doses of systemic corticosteroids during pregnancy. Women exposed to betamethasone during pregnancy for the treatment of an autoimmune disease may contact the OTIS Autoimmune Diseases Study at 877-311-8972.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsCorticosteroids are excreted in human milk. The onset of milk secretion after birth may be delayed and the volume of milk produced may be decreased by antenatal betamethasone therapy; this affect was seen when delivery occurred 3-9 days after the betamethasone dose in women between 28 and 34 weeks gestation. Antenatal betamethasone therapy did not affect milk production when birth occurred <3 days or >10 days of treatment. It is not known if systemic absorption following topical administration results in detectable quantities in human milk. Use with caution while breast-feeding; do not apply to nipples.

Adverse Reactions

Systemic:

Cardiovascular: Congestive heart failure, edema, hyper-/hypotension

Central nervous system: Dizziness, headache, insomnia, intracranial pressure increased, lightheadedness, nervousness, pseudotumor cerebri, seizure, vertigo

Dermatologic: Ecchymoses, facial erythema, fragile skin, hirsutism, hyper-/hypopigmentation, perioral dermatitis (oral), petechiae, striae, wound healing impaired

Endocrine & metabolic: Amenorrhea, Cushing's syndrome, diabetes mellitus, growth suppression, hyperglycemia, hypokalemia, menstrual irregularities, pituitary-adrenal axis suppression, protein catabolism, sodium retention, water retention

Gastrointestinal: Abdominal distention, appetite increased, hiccups, indigestion, peptic ulcer, pancreatitis, ulcerative esophagitis

Local: Injection site reactions (intra-articular use), sterile abscess

Neuromuscular & skeletal: Arthralgia, muscle atrophy, fractures, muscle weakness, myopathy, osteoporosis, necrosis (femoral and humeral heads)

Ocular: Cataracts, glaucoma, intraocular pressure increased

Miscellaneous: Anaphylactoid reaction, diaphoresis, hypersensitivity, secondary infection

Topical:

Dermatologic: Acneiform eruptions, allergic dermatitis, burning, dry skin, erythema, folliculitis, hypertrichosis, irritation, miliaria, pruritus, skin atrophy, striae, vesiculation

Endocrine and metabolic effects have occasionally been reported with topical use.

Metabolism/Transport Effects **Inhibits** CYP3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Betamethasone interferes with calcium absorption.

Herb/Nutraceutical: Avoid cat's claw, echinacea (have immunostimulant properties).

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic response and adverse effects according to indications for therapy, dose, route (systemic or topical), and duration of therapy. When used for long-term therapy (>10-14 days), do not discontinue abruptly; decrease dosage incrementally. Growth should be routinely monitored in pediatric patients. With systemic administration, caution patients with diabetes to monitor glucose levels closely (corticosteroids may alter glucose levels). Teach patient proper use (according to formulation), side effects/appropriate interventions, and symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed; do not increase dose or discontinue this medicine abruptly without consulting prescriber. Take oral medication with or after meals. Avoid alcohol and limit intake of caffeine or stimulants. Prescriber may recommend increased dietary vitamins, minerals, or iron. If you have diabetes, monitor glucose levels closely (antidiabetic medication may need to be adjusted). Inform prescriber if you are experiencing greater-than-normal levels of stress (medication may need adjustment). You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccination without consulting prescriber). Some forms of this medication may cause GI upset (small frequent meals and frequent mouth care may help or oral medication may be taken with meals to reduce GI upset). Report promptly excessive nervousness or sleep disturbances; signs of infection (eg, sore throat, unhealed injuries); excessive growth of body hair or loss of skin color; vision changes; excessive or sudden weight gain (>5 lb/week); swelling of face or extremities; respiratory difficulty; muscle weakness; change in color of stools (tarry) or persistent abdominal pain; or worsening of condition or failure to improve.

Topical: For external use only. Do not use for eyes, mucous membranes, or open wounds. Use exactly as directed. Before using, wash and dry area gently. Apply in a thin layer (may rub in lightly). Apply light dressing (if necessary) to area being treated. Do not use occlusive dressing unless so advised by prescriber. Avoid prolonged or excessive use around sensitive tissues, genital, or rectal areas. Avoid exposing treated area to direct sunlight. Inform prescriber if condition worsens (redness, swelling, irritation, signs of infection, or open sores) or fails to improve.

Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: Potency expressed as betamethasone base.

Aerosol, topical, as valerate [foam]:

Luxiq®: 0.12% (50 g, 100 g, 150 g) [strength expressed as salt; contains ethanol 60.4%]

Cream, topical, as dipropionate: 0.05% (15 g, 45 g)

Cream, topical, as dipropionate augmented: 0.05% (15 g, 50 g)

Diprolene® AF: 0.05% (15 g, 50 g)

Cream, topical, as valerate (Beta-Val®): 0.1% (15 g, 45 g)

Beta-Val®: 0.1% (15 g, 45 g)

Gel, topical, as dipropionate augmented: 0.05% (15 g, 50 g)

Injection, suspension:

Celestone® Soluspan®: Betamethasone sodium phosphate 3 mg and betamethasone acetate 3 mg per 1 mL (5 mL) [6 mg/mL]

Lotion, topical, as dipropionate: 0.05% (60 mL)

Lotion, topical, as dipropionate augmented:

Diprolene®: 0.05% (30 mL, 60 mL)

Lotion, topical, as valerate: 0.1% (60 mL)

Beta-Val®: 0.1% (60 mL)

Ointment, topical, as dipropionate: 0.05% (15 g, 45 g)

Ointment, topical, as dipropionate augmented: 0.05% (15 g, 50 g)

Diprolene®: 0.05% (15 g, 50 g)

Ointment, topical, as valerate: 0.1% (15 g, 45 g)

Solution, as base:

Celestone®: 0.6 mg/5 mL (118 mL) [contains alcohol and sodium benzoate; cherry-orange flavor]

Generic AvailableYes: Excludes aerosol, injection, solution

Mechanism of ActionControls the rate of protein synthesis; depresses the migration of polymorphonuclear leukocytes, fibroblasts; reverses capillary permeability and lysosomal stabilization at the cellular level to prevent or control inflammation

Pharmacodynamics/Kinetics

Protein binding: 64%

Metabolism: Hepatic

Half-life elimination: 6.5 hours

Time to peak, serum: I.V.: 10-36 minutes

Excretion: Urine (<5% as unchanged drug)

Related Information

- Corticosteroids

Pharmacotherapy Pearls

Very high potency: Augmented betamethasone dipropionate ointment, lotion

High potency: Augmented betamethasone dipropionate cream, betamethasone dipropionate cream and ointment

Intermediate potency: Betamethasone dipropionate lotion, betamethasone valerate cream

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, insomnia, or nervousness

Mental Health: Effects on Psychiatric TreatmentEnzyme inducers (barbiturates) may decrease the effects of corticosteroids

Cardiovascular ConsiderationsLong-term steroid therapy is associated with fluid retention and hypertension. Glucocorticoid agents have some mineralocorticoid activity with consequent hemodynamic effects. Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. In discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that the steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia.

Oral and intravenous steroid therapy in patients with heart failure should be administered cautiously with special attention given to signs and symptoms of fluid retention.

Anesthesia and Critical Care Concerns/Other Considerations

Neuromuscular Effects: ICU-acquired paresis was recently studied in five ICUs (three medical and two surgical) at four French hospitals. All ICU patients without pre-existing neuromuscular disease admitted from March 1999 through June 2000 were evaluated (de Jonghe, 2002). Each patient had to be mechanically ventilated for ≥7 days and was screened daily for awakening. The first day the patient was considered awake was Study Day 1. Patients with severe muscle weakness on Study Day 7 were considered to have ICU-acquired paresis. Among the 95 patients who were evaluable, about 25% developed ICU-acquired paresis. Independent predictors included female gender, the number of days with two or more organ dysfunctions, and administration of corticosteroids. Further studies may be required to verify and characterize the association between the development of ICU-acquired paresis and use of corticosteroids. Concurrent use of a corticosteroid and muscle relaxant appear to increase the risk of certain ICU myopathies; avoid or administer the corticosteroid at the lowest dose possible.

Adrenal Insufficiency: Patients will often have steroid-induced adverse effects on glucose tolerance and lipid profiles. When discontinuing steroid therapy in patients on long-term steroid supplementation, it is important that the steroid therapy be discontinued gradually. Abrupt withdrawal may result in adrenal insufficiency with hypotension and hyperkalemia. Patients on long-term steroid supplementation will require higher corticosteroid doses, with hydrocortisone or cortisone, when subject to stress (ie, trauma, surgery, severe infection). Guidelines for glucocorticoid replacement during various surgical procedures has been published (Coursin, 2002; Salem, 1994).

Septic Shock: A recent randomized, double-blind, placebo-controlled trial assessed whether low-dose corticosteroid administration could improve 28-day survival in patients with septic shock and relative adrenal insufficiency. Relative adrenal insufficiency was defined as an inappropriate response to corticotropin administration (increase of serum cortisol ≤9 mcg/dL from baseline). Cortisol levels were drawn immediately before corticotropin administration and 30-60 minutes afterwards. Three hundred adult septic shock patients requiring mechanical ventilation and vasopressor support were randomized to either hydrocortisone (50 mg IVP every 6 hours) and fludrocortisone (50 mcg tablet daily via nasogastric tube) or matching placebos for 7 days. In patients who did not appropriately respond to corticotropin (nonresponders), there were significantly fewer deaths in the active treatment group. Vasopressor therapy was withdrawn more frequently in this subset of the active treatment group. Adverse events were similar in both groups. Patients who lack adrenal reserve and thus have relative adrenal insufficiency during the stress of septic shock may benefit from physiologic steroid replacement. However, there was a trend for increased mortality in patients who responded to the corticotropin test (increase of serum cortisol >9 mcg/dL from baseline). These patients may not benefit from physiologic steroid replacement. Further study is required to better characterize the patient populations who may benefit.

Head Injury: The use of high-dose corticosteroids in acute head injury has been investigated in an international, double-blind, placebo-controlled trial. The purpose of this trial was to evaluate the effect of early administration of a 48-hour infusion of methylprednisolone on the risk of death and disability after a head injury. Adults (≥16 years of age) were randomized within 8 hours of a head injury if they had a Glasgow coma score of 14 or less and had no clear indication or contraindication for corticosteroid use. Ten thousand and eight patients were randomized to either placebo or 2 g of methylprednisolone infused over 1 hour, followed by a continuous infusion of 0.4 g per hour for 48 hours. Primary outcome measures were death from any cause within 2 weeks of injury and the composite of death or disability after 6 months. Patients that received methylprednisolone had a higher relative risk of death at 2 weeks and at 6 months. The risk of death or disability at 6 months was higher in the methylprednisolone group, but this result was not statistically significant. There were also no subsets of patients (time since injury, severity of injury) that benefited from corticosteroid treatment. The investigators concluded that corticosteroids should not be routinely used in the treatment of acute head injury (CRASH Trial Collaborators; Roberts, 2004; Edwards, 2005).

Index TermsBetamethasone Dipropionate; Betamethasone Dipropionate, Augmented; Betamethasone Sodium Phosphate; Betamethasone Valerate; Flubenisolone

Medication Safety Issues

Sound-alike/look-alike issues:

> Betaxolol may be confused with bethanechol, labetalol
>
> Betoptic® S may be confused with Betagan®, Timoptic®

Pronunciation(be TAKS oh lol)

U.S. Brand NamesBetoptic® S; Kerlone®

Canadian Brand NamesBetoptic® S; Sandoz-Betaxolol

Pharmacologic CategoryBeta Blocker, Beta$_1$ Selective; Ophthalmic Agent, Antiglaucoma

Use: Labeled Indications

Ophthalmic: Treatment of chronic open-angle glaucoma or ocular hypertension

Oral: Management of hypertension

Dosing: Adults

Glaucoma: Ophthalmic:

> Solution: Instill 1-2 drops into affected eye(s) twice daily.
>
> Suspension (Betoptic® S): Instill 1 drop into affected eye(s) twice daily.

Hypertension, angina: Oral: 5-10 mg/day; may increase dose to 20 mg/day after 7-14 days if desired response is not achieved

Dosing: Elderly

Ophthalmic: Refer to adult dosing.

Hypertension: Oral: Initial: 5 mg/day

Dosing: Pediatric**Elevated intraocular pressure:** Ophthalmic suspension (Betoptic® S): Instill 1 drop into affected eye(s) twice daily.

Dosing: Renal Impairment
Severe impairment: Initial dose: 5 mg/day; may increase every 2 weeks up to a maximum of 20 mg/day.

Hemodialysis: Initial dose: 5 mg/day; may increase every 2 weeks up to a maximum of 20 mg/day. Supplemental dose not required.

Calculations

- Creatinine Clearance: Adults

Administration: OralAbsorption is not affected by food.

Administration: OtherOphthalmic: Shake suspension well before using. Tilt head back and instill in eye. Keep eye open and do not blink for 30 seconds. Apply gentle pressure to lacrimal sac for 1 minute. Wipe away excess from skin. Do not touch applicator to eye and do not contaminate tip of applicator.

StorageAvoid freezing. Store tablets at room temperature of 15°C to 25°C (59°F to 77°F). Store ophthalmic suspension upright at 2°C to 25°C (36°F to 77°F). Store ophthalmic solution at room temperature.

ContraindicationsHypersensitivity to betaxolol or any component of the formulation; sinus bradycardia; heart block greater than first-degree (except in patients with a functioning artificial pacemaker); cardiogenic shock; uncompensated cardiac failure

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Concerns related to adverse events:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; however, betaxolol, with B$_1$

selectivity, may be used cautiously with the lowest possible dose (eg, 5-10 mg/day), availability of a bronchodilator, and close monitoring; if a dosage increase is indicated, administer in divided doses.

- Cerebrovascular insufficiency: Use with caution in patients with cerebrovascular insufficiency; hypotension and decreased heart rate may reduce cerebral blood flow.
- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating therapy.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate and/or mask signs and symptoms of hypoglycemia.
- Heart failure (HF): Use with caution in patients with compensated heart failure and monitor for a worsening of the condition. Discontinue ophthalmic preparations with signs of cardiac failure.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; may potentiate myasthenia-related muscle weakness, including diplopia and ptosis.
- Peripheral vascular disease (PVD) and Raynaud's disease: May precipitate or aggravate symptoms of arterial insufficiency in patients with PVD and Raynaud's disease. Use with caution and monitor for progression of arterial obstruction.
- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.
- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required in severe impairment and in patients on dialysis.
- Thyroid disease: May mask signs of hyperthyroidism (eg, tachycardia). If hyperthyroidism is suspected, carefully manage and monitor; abrupt withdrawal may precipitate thyroid storm.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents which decrease myocardial function.
- Calcium channel blockers: Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur.
- Cardiac glycosides: Use with caution in patients receiving digoxin; bradycardia or heart block can occur.

Special populations:

- Contact lens wearers: Ophthalmic suspension contains benzalkonium chloride which may be absorbed by contact lenses; remove contact lens prior to administration and wait 15 minutes before reinserting.
- Elderly: Bradycardia may be observed more frequently in elderly patients (>65 years of age); dosage reductions may be necessary.
- Pediatrics: Safety and efficacy of the oral formulation have not been established in children.

Dosage form specific issues:

- Ophthalmic: Inadvertent contamination of multiple-dose ophthalmic solutions has caused bacterial keratitis. Should not be used alone in angle-closure glaucoma (has no effect on pupillary constriction). Choroidal detachment has been reported with aqueous suppressant therapy after filtration procedures.

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, ischemia, and/or angina exacerbation.

Geriatric ConsiderationsDue to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (ie, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20% to 50% in elderly populations. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; however, there was drug-related postimplantation loss in rats and rabbits. There are no adequate and well-controlled studies in pregnant women.

LactationOral: Enters breast milk/use caution

Adverse Reactions

Ophthalmic:

>10%: Ocular: Short-term discomfort (≤25%)

<1%: Alopecia, asthma, bradycardia, bronchial secretions thickened, bronchospasm, depression, dizziness, dyspnea, glossitis, heart block, heart failure, headache, hives, insomnia, lethargy, myasthenia gravis exacerbation, respiratory failure, smell/taste perversion, toxic epidermal necrolysis, vertigo

Frequency not defined: Ocular: Allergic reaction, anisocoria, blurred vision, choroidal detachment, corneal punctate keratitis, corneal punctate staining (with or without dendritic formations), corneal sensitivity decreased, corneal staining, crusty lashes, discharge, dry eyes, edema, erythema, foreign body sensation, inflammation, itching sensation, keratitis, ocular pain, photophobia, tearing, visual acuity decreased

Systemic:

2% to 10%:

Cardiovascular: Bradycardia (6% to 8%; symptomatic bradycardia: <1% to 2%; dose-dependent), chest pain (2% to 7%), palpitation (2%), edema (≤2%; similar to placebo)

Central nervous system: Fatigue (3% to 10%), insomnia (1% to 5%), lethargy (3%)

Gastrointestinal: Nausea (2% to 6%), dyspepsia (4% to 5%), diarrhea (2%)

Neuromuscular & Skeletal: Arthralgia (3% to 5%), paresthesia (2%)

Respiratory: Dyspnea (2%), pharyngitis (2%)

Miscellaneous: Antinuclear antibody positive (5%), cold extremities (2%)

<2%, postmarketing, and/or case reports (limited to important or life-threatening): Acidosis, allergy, alopecia, ALT increased, AST increased, amnesia, anemia, angina, anorexia, arrhythmia, arthropathy, ataxia, atrioventricular block, blepharitis, breast fibroadenosis, bronchitis, bronchospasm, cataract, cerebrovascular disorder, conjunctivitis, constipation, cough, cystitis, deafness, depression (<1%), diabetes, diaphoresis, dreams abnormal (1%), dysphagia, dysuria, emotional lability, epistaxis, erythematous rash, fever, flu, flushing, hallucinations, heart failure, hyper-/hypotension, hypercholesterolemia, hyperglycemia, hypo/hyperkalemia, hyperlipemia, hypertrichosis, hyperuricemia, impotence (1%), intermittent claudication, iritis, labyrinth disorder, LDH increased, leukocytosis, libido decreased, lymphadenopathy, malaise, menstrual disorder, MI, muscle cramps, nervousness (1%), neuralgia, neuropathy, numbness, ocular hemorrhage, oliguria, peripheral ischemia, Peyronie's disease, pneumonia, prostatitis, proteinuria, pruritus, purpura, rash (1%), renal function abnormal, rhinitis (1%), rigors, scotoma, sinusitis, stupor, syncope, taste abnormal, tendonitis, thinking abnormal, thrombophlebitis, thrombosis, tinnitus, tremor, twitching, thrombocytopenia, vision abnormal, vomiting, weight gain/loss, xerostomia

Metabolism/Transport Effects **Substrate** (major) of CYP1A2, 2D6; **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid bayberry; blue cohosh, cayenne, ephedra, ginger, ginseng (American), gotu kola, and licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effects).

Test InteractionsOral betaxolol may interfere with glaucoma screening tests.

Monitoring ParametersOphthalmic: Intraocular pressure. Systemic: Blood pressure, pulse; baseline renal function

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (especially products that affects cardiac function or blood pressure). Assess therapeutic response and adverse effects. Patients with diabetes should be cautioned that beta-blockers may mask prominent hypoglycemic symptoms. Teach patient proper use (according to formulation), side effects/appropriate interventions, and symptoms to report. Systemic absorption from ophthalmic instillation is minimal. Intraocular pressure should be measured periodically.

Monitoring: Lab TestsOphthalmic: Intraocular pressure. Systemic: Baseline renal function.

Patient EducationDo not take any new medication during therapy unless approved by prescriber.

Oral: Use as directed and do not discontinue this medicine without consulting prescriber. May cause dizziness or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). If you have diabetes, may mask prominent hypoglycemic symptoms. Monitor blood glucose levels closely. Report chest pain, palpitations or irregular heartbeat; persistent GI upset (eg, nausea, vomiting, diarrhea, or constipation); unusual cough; respiratory difficulty; swelling or coolness of extremities; or unusual mental depression. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Ophthalmic: Shake suspension well before using. Tilt head back and instill in eye. Keep eye open; do not blink for 30 seconds. Apply gentle pressure to corner of eye for 1 minute. Wipe away excess from skin. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Report if condition does not improve or if you experience eye pain, vision changes, or other adverse eye response. Remove contact lens prior to administration and wait 15 minutes before reinserting. If other ophthalmic medicines are being used, administer at least 10 minutes prior to instilling this medicine.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Solution, ophthalmic: 0.5% (5 mL, 10 mL, 15 mL) [contains benzalkonium chloride]

Suspension, ophthalmic:

Betoptic® S: 0.25% (5 mL [DSC], 10 mL, 15 mL) [contains benzalkonium chloride]

Tablet, as hydrochloride: 10 mg, 20 mg

Kerlone®: 10 mg, 20 mg

Generic AvailableYes: Solution, tablet

Pricing: U.S. (www.drugstore.com)

Solution (Betaxolol HCl)

0.5% (15): $79.69

Suspension (Betoptic-S)

0.25% (5): $51.99

0.25% (10): $95.99

0.25% (15): $142.76

Tablets (Betaxolol HCl)

10 mg (30): $36.99

Tablets (Kerlone)

10 mg (30): $50.99

Mechanism of ActionCompetitively blocks beta$_1$-receptors, with little or no effect on beta$_2$-receptors; with ophthalmic use, reduces intraocular pressure by reducing the production of aqueous humor

Pharmacodynamics/Kinetics

Onset of action: Ophthalmic: 30 minutes; Oral: 1-1.5 hours

Duration: Ophthalmic: ≥12 hours

Absorption: Ophthalmic: Some systemic; Oral: ~100%

Metabolism: Hepatic to multiple metabolites

Protein binding: Oral: ~50%

Bioavailability: Oral: 89%

Half-life elimination: Oral: 14-22 hours; prolonged in hepatic disease and/or chronic renal failure

Time to peak: Ophthalmic: ~2 hours; Oral: 1.5-6 hours

Excretion: Urine (>80%; as unchanged drug [15%] and inactive metabolites)

Related Information

- Beta-Blockers
- Glaucoma Drug Therapy

Dental Health: Effects on Dental TreatmentBetaxolol is a cardioselective beta-blocker. Local anesthetic with vasoconstrictor can be safely used in patients medicated with betaxolol. Nonselective beta-blockers (ie, propranolol, nadolol) enhance the pressor response to epinephrine, resulting in hypertension and bradycardia; this has not been reported for betaxolol. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness; rare reports of depression and hallucinations

Mental Health: Effects on Psychiatric TreatmentHas been used to treat akathisia; propranolol preferred

Cardiovascular Considerations

Hypertension: Beta-blocker therapy in the treatment of hypertension has been associated with improved cardiovascular outcomes. This class of drug is beneficial for elderly patients with hypertension. A recent UKPDS study showed that beta-blocker therapy (atenolol) was as effective as an ACE inhibitor in reducing cardiovascular events and that the benefits of therapy were related more to the degree of antihypertensive efficacy rather than the class of drug used.

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered to avoid acute tachycardia and hypertension.

Anesthesia and Critical Care Concerns/Other Considerations**Surgery:** Based on available evidence, beta-blockers should be started days to weeks before elective surgery in selected patients when possible and titrated to a heart rate <65 beats per minute. Additional data suggest that long acting beta-blockers may be superior to short acting ones (Redelmeier, 2005). The ACC/AHA 2007 guidelines on perioperative cardiovascular evaluation and care for noncardiac surgery recommend beta-blockers be continued in patients undergoing surgery who are receiving beta-blockers to treat angina, symptomatic arrhythmias, hypertension, and other ACC/AHA Class I guideline indications (Class I recommendation). The guidelines also recommend that beta-blockers be given to patients undergoing vascular surgery who have myocardial ischemia demonstrated during preoperative testing (Class I recommendation). Since the publication of these guidelines, there have been two large trials published regarding this issue.

The guidelines also state that beta-blockers are probably recommended in patients undergoing intermediate risk (eg, carotid endarterectomy, prostate surgery) or vascular surgery in whom preoperative assessment identifies coronary heart disease or high cardiac risk (Class IIa recommendation). High cardiac risk is defined as having >1 of the following clinical risk factors: History of ischemic heart disease, compensated or prior heart failure, cerebrovascular disease, diabetes mellitus, or renal insufficiency. The use of beta-blockers is uncertain in patients undergoing intermediate risk or vascular surgery with ≤1 clinical risk factor (Class IIb recommendation).

The majority of published trials suggest a benefit of perioperative beta-blocker use during noncardiac surgery especially in high-risk patients; however, more recent clinical trials have not shown a benefit to perioperative beta-blockade for noncardiac surgery (Juul, 2006; Yang, 2006).

Index TermsBetaxolol Hydrochloride

Bethanechol

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Bethanechol may be confused with betaxolol

Pronunciation(be THAN e kole)
U.S. Brand NamesUrecholine®
Canadian Brand NamesDuvoid®; PMS-Bethanechol
Pharmacologic CategoryCholinergic Agonist
Use: Labeled IndicationsTreatment of acute postoperative and postpartum nonobstructive (functional) urinary retention; treatment of neurogenic atony of the urinary bladder with retention
Use: Unlabeled/InvestigationalGastroesophageal reflux
Dosing: Adults

Urinary retention, neurogenic bladder: Oral: Initial: 10-50 mg 3-4 times/day (some patients may require dosages of 50-100 mg 4 times/day). To determine effective dose, may initiate at a dose of 5-10 mg, with additional doses of 5-10 mg hourly until an effective cumulative dose is reached. Cholinergic effects at higher oral dosages may be cumulative.

Gastroesophageal reflux (unlabeled): Oral: 25 mg 4 times/day

Dosing: ElderlyRefer to adult dosing. Use the lowest effective dose.
Dosing: Pediatric

Urinary retention (unlabeled use): Oral: 0.3-0.6 mg/kg/day in 3-4 divided doses

Gastroesophageal reflux (unlabeled use): Oral: 0.3-0.6 mg/kg/day in 3-4 divided doses

Dietary ConsiderationsShould be taken 1 hour before meals or 2 hours after meals.
StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to bethanechol or any component of the formulation; mechanical obstruction of the GI or GU tract or when the strength or integrity of the GI or bladder wall is in question; hyperthyroidism, peptic ulcer disease, epilepsy, asthma, bradycardia, vasomotor instability, coronary artery disease, hypotension, or parkinsonism
Allergy Considerations

- Bethanechol Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Reflux infection: Potential for reflux infection if the sphincter fails to relax as bethanechol contracts the bladder.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsUrinary incontinence in elderly patients should be investigated. Bethanechol may be used for overflow incontinence (ie, dribbling) caused by an atonic or hypotonic bladder, but clinical efficacy is variable.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension, tachycardia, flushed skin

Central nervous system: Headache, malaise, seizure

Gastrointestinal: Abdominal cramps, belching, borborygmi, colicky pain, diarrhea, nausea, vomiting, salivation

Genitourinary: Urinary urgency

Ocular: Lacrimation, miosis

Respiratory: Asthmatic attacks, bronchial constriction

Miscellaneous: Diaphoresis

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Test InteractionsIncreased lipase, amylase (S), bilirubin, aminotransferase [ALT/AST] (S)

Monitoring ParametersObserve closely for side effects.

Nursing: Physical Assessment/MonitoringAssess bladder and sphincter adequacy prior to administering medication. Assess other medications patient may be taking for effectiveness and interactions. Assess therapeutic effectiveness and adverse reactions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake as directed, on an empty stomach to avoid nausea or vomiting. Do not discontinue this medicine without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause dizziness or hypotension (rise slowly from sitting or lying position and use caution when driving or climbing stairs); or vomiting or loss of appetite (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report persistent abdominal discomfort; significantly increased salivation, sweating, tearing, or urination; flushed skin; chest pain or palpitations; acute headache; unresolved diarrhea; excessive fatigue, insomnia, dizziness, or depression; increased muscle, joint, or body pain; vision changes or blurred vision; or respiratory difficulty or wheezing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet, as chloride: 5 mg, 10 mg, 25 mg, 50 mg

Duvoid® [CAN]: 10 mg, 25 mg, 50 mg [not available in U.S.]

Urecholine®: 5 mg, 10 mg, 25 mg, 50 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Bethanechol Chloride)

5 mg (90): $59.99

10 mg (90): $89.98

25 mg (90): $128.99

50 mg (90): $179.99

Tablets (Urecholine)

5 mg (90): $78.48

10 mg (90): $117.59

25 mg (90): $239.80

50 mg (90): $243.59

Mechanism of ActionDue to stimulation of the parasympathetic nervous system, bethanechol increases bladder muscle tone causing contractions which initiate urination. Bethanechol also stimulates gastric motility, increases gastric tone and may restore peristalsis.

Pharmacodynamics/Kinetics

Onset of action: 30-90 minutes

Duration: Up to 6 hours

Absorption: Variable

Dental Health: Effects on Dental TreatmentThis is a cholinergic agent similar to pilocarpine; expect to see salivation and sweating in patients.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentContraindicated in Parkinson's disease

Index TermsBethanechol Chloride

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Bevacizumab: Reports of Toxic Anterior Segment Syndrome (TASS), Endophthalmitis, and Eye Inflammation with Intravitreal Use - December 2008

Hoffman-La Roche Limited (Roche), in conjunction with Health Canada, has issued a “Dear Healthcare Professional” letter concerning intravitreal (off-label) use of bevacizumab (Avastin®) and reports of endophthalmitis, eye inflammation, blurred vision, floaters, and Toxic Anterior Segment Syndrome (TASS). TASS, a sterile postoperative inflammatory reaction that leads to intraocular tissue toxicity, is due to the introduction of a non-infectious substance into the anterior segment of the eye.

As of November 2008, all cases reported in Canada (n=25), have been associated with intravitreal use of a specific lot of bevacizumab (B3002B028). In Canada, bevacizumab is approved for intravenous administration in the treatment of metastatic colon or rectal carcinoma and **is not** authorized for use in the ophthalmology setting.

Further information can be found at:

Canada: http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/_2008/avastin_4_hpc-cps-eng.php

Bevacizumab: Reports of Microangiopathic Hemolytic Anemia (MAHA) in Association With Concomitant Sunitinib Therapy - July 2008

Genentech Inc (in conjunction with the U.S. Food and Drug Administration [FDA]) and Hoffmann-La Roche Limited (in conjunction with Health Canada) have issued warnings to their respective healthcare professionals regarding the risk for MAHA in association with the concomitant use of bevacizumab (Avastin®) and sunitinib (Sutent®). Upcoming changes to the Canadian labeling for bevacizumab are based on observations made in 2 recent investigational U.S. studies involving combination therapy with a fixed dose of bevacizumab (10 mg/kg every 2 weeks) and variable doses of sunitinib (25 mg, 37.5 mg, or 50 mg/day) in patients with metastatic renal cell carcinoma (mRCC).

Although not reported in patients receiving bevacizumab with sunitinib at lower doses, laboratory findings (schistocytes on microscopy, LDH increased, serum haptoglobin decreased) consistent with MAHA were observed in 37% (n=19) of patients receiving bevacizumab and sunitinib 50 mg/day. Symptoms of MAHA include darkened urine, jaundice, confusion, fever, and splenomegaly or hepatomegaly. Grades 3 or 4 hypertension and reversible posterior leukoencephalopathy syndrome (RPLS), were observed in some patients who developed MAHA. Resolution of these adverse findings was observed within 3 weeks of discontinuing both bevacizumab and sunitinib. In the U.S. and in Canada bevacizumab is **not** approved for use in combination with sunitinib or in the treatment of mRCC. Additionally in Canada, bevacizumab is **not** approved for use at doses above 5 mg/kg every 2 weeks.

Further information may be found at:

Medication Safety Issues

Sound-alike/look-alike issues:

Bevacizumab may be confused with cetuximab

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(be vuh SIZ uh mab)

U.S. Brand NamesAvastin®

Canadian Brand NamesAvastin®

Pharmacologic CategoryAntineoplastic Agent, Monoclonal Antibody; Vascular Endothelial Growth Factor (VEGF) Inhibitor

Use: Labeled IndicationsTreatment of metastatic colorectal cancer; treatment of nonsquamous, nonsmall cell lung cancer; treatment of breast cancer (metastatic, HER-2 negative)

Use: Unlabeled/InvestigationalTreatment of ovarian cancer (early stage), renal cell cancer, age-related macular degeneration (AMD)

Dosing: AdultsDetails concerning dosing in combination regimens should also be consulted.

Breast cancer: I.V.: 10 mg/kg every 2 weeks (in combination with paclitaxel)

Colorectal cancer: I.V.: 5 or 10 mg/kg every 2 weeks (in combination with fluorouracil-based chemotherapy)

Lung cancer, nonsquamous cell nonsmall cell: I.V.: 15 mg/kg every 3 weeks (in combination with carboplatin and paclitaxel)

AMD (unlabeled use): Intravitreal: 1.25 mg (0.05 mL) monthly until improvement/resolution, usually ~1-3 injections (Avery, 2006) or 2.5 mg (0.1 mL) every 4 weeks for 3 doses (Bashshur, 2006)

Renal cell cancer (unlabeled use): I.V.: 10 mg/kg every 2 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Adjustment for ToxicityI.V. administration (systemic): Temporary suspension is recommended in moderate-to-severe proteinuria (in most studies, treatment was withheld for ≥2 g proteinuria/24 hours) or in patients with severe hypertension which is not controlled with medical management. Permanent discontinuation is recommended (by the manufacturer) in patients who develop wound dehiscence requiring intervention, fistula (gastrointestinal and nongastrointestinal), gastrointestinal perforation, hypertensive crisis, hypertensive encephalopathy, intra-abdominal abscess, serious bleeding, severe arterial thrombotic event, nephrotic syndrome, or RPLS.

Dosing: Combination Regimens

Brain tumors: Bevacizumab-Irinotecan (Glioblastoma)

Breast cancer:

Bevacizumab-Capecitabine

Docetaxel-Bevacizumab

Paclitaxel-Bevacizumab

Colorectal cancer:

Bevacizumab-Fluorouracil-Leucovorin

Bevacizumab-Irinotecan-Fluorouracil-Leucovorin

Bevacizumab-Oxaliplatin-Fluorouracil-Leucovorin

Lung cancer (nonsmall cell):

Bevacizumab-Cisplatin-Gemcitabine

Paclitaxel-Carboplatin-Bevacizumab

Renal cell cancer: Bevacizumab-Interferon Alfa-2a

Administration: I.V.

I.V. infusion, usually after the other antineoplastic agents. Infuse the initial dose over 90 minutes. Infusion may be shortened to 60 minutes if the initial infusion is well tolerated. The third and subsequent infusions may be shortened to 30 minutes if the 60-minute infusion is well tolerated. Some institutions use a 10-minute infusion (0.5 mg/kg/minute) for bevacizumab dosed at 5 mg/kg (Reidy, 2007).

Intravitreal injection (unlabeled use): Adequate anesthesia and a broad-spectrum antimicrobial agent should be administered prior to the procedure; administer topical antibiotics for 3 days after procedure.

Administration: I.V. DetailMonitor closely during the infusion for signs/symptoms of an infusion reaction.

pH: 6.2

StorageStore vials at 2°C to 8°C (36°F to 46°F). Protect from light; do not freeze or shake. Diluted solutions are stable for up to 8 hours under refrigeration.

ReconstitutionPrior to infusion, dilute prescribed dose of bevacizumab in 100 mL NS. Do not mix with dextrose-containing solutions.

ContraindicationsThere are no contraindications listed in the manufacturer's labeling.

Allergy Considerations

- Bevacizumab Allergy

Warnings/Precautions

Boxed warnings:

- Bleeding: See "Concerns related to adverse effects" below.
- Gastrointestinal perforation: See "Concerns related to adverse effects" below.
- Wound dehiscence: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Bleeding: **[U.S. Boxed Warning]: Avoid use in patients with recent hemoptysis (>2.5 mL blood); significant pulmonary bleeding has been reported in patients receiving bevacizumab (primarily in patients with nonsmall cell lung cancer with squamous cell histology [not an FDA-approved indication]).** Other serious bleeding events may occur, but with a lower frequency; discontinuation of treatment is recommended in all patients with serious hemorrhage.

- Gastrointestinal perforation: **[U.S. Boxed Warning]: Gastrointestinal perforation, fistula (including gastrointestinal, enterocutaneous, esophageal, duodenal, and rectal fistulas), and intra-abdominal abscess have been reported in patients (not related to treatment duration);** monitor patients for signs/symptoms (eg, abdominal pain with constipation and/or vomiting). Permanently discontinue in patients who develop these complications.

- Hypertension: May cause and/or worsen hypertension significantly; use caution in patients with pre-existing hypertension and monitor BP closely in all patients. Permanent discontinuation is recommended in patients who experience a hypertensive crisis or encephalopathy. Temporarily discontinue in patients who develop uncontrolled hypertension.

- Infusion reactions: Infusion reactions (eg, hypertension, hypertensive crisis, wheezing, hypersensitivity, chest pain, headache, diaphoresis) may occur with the first infusion (uncommon). Interrupt therapy in patients experiencing severe infusion reactions; there are no data to address reinstitution of therapy in patients who experience severe infusion reactions.

- Nephrotic syndrome/proteinuria: Proteinuria and/or nephrotic syndrome has been associated with use; discontinue in patients with nephrotic syndrome.

- Nongastrointestinal fistula formation: Nongastrointestinal fistula formation (including tracheoesophageal, bronchopleural, biliary, vaginal, and bladder fistulas) has been observed, most commonly within the first 6 months of treatment. Permanently discontinue in patients who develop internal organ fistulas.

- Reversible posterior leukoencephalopathy syndrome (RPLS): Cases of reversible posterior leukoencephalopathy syndrome (RPLS) have been reported. Symptoms (which include headache, seizure, confusion, lethargy, blindness and/or other vision, or neurologic disturbances) may occur from 16 hours to 1 year after treatment initiation. RPLS may be associated with hypertension; discontinue therapy and begin management of hypertension, if present.

- Thromboembolism: An increased risk for arterial thromboembolic events (eg, stroke, MI, TIA, angina) is associated with use in combination with chemotherapy. History of arterial thromboembolism or ≥65 years of age may present an even greater risk; permanently discontinue if serious arterial thromboembolic events occur. Although patients with cancer are at risk for venous thromboembolism, a meta-analysis of 15 controlled trials has demonstrated an increased risk for venous thromboembolism in patients who received bevacizumab (Nalluri, 2008).

- Wound dehiscence: **[U.S. Boxed Warning]: Wound dehiscence/wound healing complications have been reported in patients (not related to treatment duration);** monitor patients for signs/symptoms of improper wound healing. Permanently discontinue in patients who develop these complications. The appropriate intervals between administration of bevacizumab and surgical procedures to avoid impairment in wound healing has not been established. Therapy should not be initiated within 28 days of major surgery and only following complete healing of the incision. Bevacizumab should be discontinued prior to elective surgery and the estimated half-life (20 days) should be considered.

Disease-related concerns:

- Cardiovascular disease: The risk for heart failure, including left ventricular dysfunction, is higher in patients receiving bevacizumab plus chemotherapy when compared to chemotherapy alone. Use with caution in patients with cardiovascular disease; patients with significant recent cardiovascular disease were excluded from clinical trials. The safety of therapy resumption or continuation in patients with cardiac dysfunction has not been studied.

- CNS metastases: Avoid use in patients with CNS metastases; patients with CNS metastases were excluded from clinical trials due to concerns for bleeding.

Concurrent drug therapy issues:

- Anthracyclines: May potentiate cardiotoxic effects of anthracyclines. HF is more common with prior anthracycline exposure and/or left chest wall irradiation.

- Myelosuppressive chemotherapy: When used in combination with myelosuppressive chemotherapy, increased rates of severe or febrile neutropenia and neutropenic infection were reported.

- Sunitinib: Microangiopathic hemolytic anemia (MAHA) has been reported when bevacizumab has been used in combination with sunitinib.

Special populations:

- Elderly: Use with caution in patients >65 years old; greater risk for adverse events, including arterial thrombotic events and proteinuria.

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsElderly patients ≥65 years of age had an increased incidence of arterial thromboembolic events; an increased risk for proteinuria; other serious adverse events occurring often include weakness, sepsis, hyper-/hypotension, CHF, constipation, anorexia, anemia, hyper-/hypokalemia, and diarrhea.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate or well-controlled studies in pregnant women, however, bevacizumab is teratogenic in animal models. Angiogenesis is of critical importance to fetal development, and bevacizumab is likely to have adverse consequences in terms of fetal development. Adequate contraception during therapy is recommended. The risk and benefit of treatment should be evaluated in pregnant women. Patients should also be counseled regarding prolonged exposure following discontinuation of therapy due to the long half-life of bevacizumab.

Based on animal studies, bevacizumab may disrupt normal menstrual cycles and impair fertility by several effects, including reduced endometrial proliferation and follicular developmental arrest. Some parameters do not recover completely, or recover very slowly following discontinuation.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsImmunoglobulins are excreted in breast milk, and it is assumed that bevacizumab may appear in breast milk. Due to concerns for effects on the infant, breast-feeding is not recommended. The half-life of bevacizumab is up to 50 days (average 20 days), and this should be considered when decisions are made concerning breast-feeding resumption.

Adverse ReactionsPercentages reported as monotherapy and as part of combination chemotherapy regimens. Some studies only reported hematologic toxicities grades ≥4 and nonhematologic toxicities grades ≥3.

>10%:

Cardiovascular: Hypertension (23% to 67%; grades 3/4: 8% to 18%), thromboembolic event (grades 3/4: 15%), hypotension (7% to 15%)

Central nervous system: Pain (61% to 62%), headache (26%; grades 3/4: 2% to 4%), dizziness (19% to 26%), fatigue (grades 3/4: 5% to 19%), sensory neuropathy (grades 3/4: 1% to 17%; in combination with paclitaxel: 24%)

Dermatologic: Alopecia (6% to 32%), dry skin (7% to 20%), exfoliative dermatitis (3% to 19%), skin discoloration (2% to 16%)

Endocrine & metabolic: Hypokalemia (12% to 16%)

Gastrointestinal: Abdominal pain (50% to 61%; grades 3/4: 8%), vomiting (47% to 52%; grades 3/4: 6% to 11%), anorexia (35% to 43%), constipation (29% to 40%), diarrhea (grades 3/4: 2% to 34%), stomatitis (30% to 32%), gastrointestinal hemorrhage (19% to 24%), dyspepsia (17% to 24%), taste disorder (14% to 21%), flatulence (11% to 19%), weight loss (15% to 16%), nausea (grades 3/4: 4% to 12%)

Hematologic: Leukopenia (grades 3/4: 37%), neutropenia (grade 4: 6% to 27%)

Neuromuscular & skeletal: Weakness (73% to 74%), myalgia (8% to 15%)

Ocular: Tearing increased (6% to 18%)

Renal: Proteinuria (36%; grades 3/4: 3%)

Respiratory: Upper respiratory infection (40% to 47%), epistaxis (32% to 35%), dyspnea (25% to 26%)

Miscellaneous: Infection (serious: 9% to 14%; pneumonia, catheter, or wound infections)

1% to 10%:

Cardiovascular: DVT (6% to 9%; grades 3/4: 9%), venous thrombus/embolus (grades 3/4: 5%), arterial thrombosis (3% to 4%), syncope (grades 3/4: 3%), intra-abdominal venous thrombosis (grades 3/4: 3%), cardio-/cerebrovascular arterial thrombotic event (2% to 4%), CHF (2%)

Central nervous system: Confusion (1% to 6%), abnormal gait (1% to 5%)

Dermatologic: Nail disorder (2% to 8%), rash desquamation (grades 3/4: 3%), wound dehiscence (1%)

Endocrine & metabolic: Dehydration (grades 3/4: 3% to 10%), hyponatremia (grades 3/4: 4%)

Gastrointestinal: Xerostomia (4% to 7%), colitis (1% to 6%), ileus (grades 3/4: 4% to 5%), gingival bleeding (2%), fistula (1%), gastrointestinal perforation (≤4%), intra-abdominal abscess (1%)

Genitourinary: Polyuria/urgency (3% to 6%), vaginal hemorrhage (4%)

Hematologic: Neutropenic fever/infection (5%; grades 3 and/or 4: 4% to 5%), thrombocytopenia (5%), hemorrhage (grades 3/4: 4% to 5%)

Hepatic: Bilirubinemia (1% to 6%)

Neuromuscular & skeletal: Bone pain (grades 3/4: 4%)

Respiratory: Voice alteration (6% to 9%), pneumonitis/pulmonary infiltrates (grades 3/4: 5%), hemoptysis (nonsquamous histology 2%)

Miscellaneous: Infusion reactions (<3%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Anastomotic ulceration, angina, cerebral infarction; fistula (biliary, bladder, bronchopleural, duodenal, enterocutaneous, esophageal, gastrointestinal, rectal, tracheoesophageal [TE] and vaginal); hemorrhagic stroke, hypertensive crises, hypertensive encephalopathy, intestinal necrosis, intestinal obstruction, mesenteric venous occlusion, microangiopathic hemolytic anemia (when used in combination with sunitinib), MI, nasal septum perforation, nephrotic syndrome, pancytopenia, polyserositis, pulmonary embolism, pulmonary hemorrhage, pulmonary hypertension, reversible posterior leukoencephalopathy syndrome (RPLS), subarachnoid hemorrhage, transient ischemic attack, ureteral stricture, wound healing complications

Oncology: VesicantNo

Oncology: Emetic PotentialVery low <10%

Drug Interactions

Antineoplastic Agents (Anthracycline): Bevacizumab may enhance the cardiotoxic effect of Antineoplastic Agents (Anthracycline). *Risk C: Monitor therapy*

Irinotecan: Bevacizumab may enhance the adverse/toxic effect of Irinotecan. *Risk C: Monitor therapy*

Sunitinib: May enhance the adverse/toxic effect of Bevacizumab. Specifically, the risk of a specific form of anemia, microangiopathic hemolytic anemia (MAHA), may be increased. *Risk X: Avoid combination*

Monitoring ParametersMonitor closely during the infusion for signs/symptoms of an infusion reaction. Monitor CBC with differential; signs/symptoms of gastrointestinal perforation, fistula, or abscess (including abdominal pain, constipation, vomiting, and fever); signs/symptoms of bleeding, including hemoptysis, gastrointestinal, and/or CNS bleeding, and/or epistaxis. Monitor blood pressure every 2-3 weeks; more frequently if hypertension develops during therapy. Continue to monitor blood pressure after discontinuing due to bevacizumab-induced hypertension. Monitor for proteinuria/nephrotic syndrome.

AMD: Monitor intraocular pressure and retinal artery perfusion

Nursing: Physical Assessment/MonitoringAssess patient prior to beginning treatment (eg, recent abdominal surgery, cardiovascular disease, hemoptysis). Assess other pharmacologic or herbal products patient may be taking for potential adverse interactions (anthracycline, irinotecan). Evaluate results of laboratory tests and adverse response (gastrointestinal perforation [abdominal pain, constipation, vomiting], serious bleeding, arterial thrombotic event, nephrotic syndrome, encephalopathy, CHF) at each infusion and throughout therapy; discontinuation may be necessary. Teach patient possible side effects/appropriate interventions, and adverse symptoms to report.

I.V.: Note specific directions for administration. Patient must be monitored closely during each infusion for infusion reaction (eg, hypertensive crisis, chest pain, wheezing, diaphoresis).

Monitoring: Lab TestsCBC with differential; urinalysis

Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. This medication can only be administered by infusion: You will be closely monitored during infusion; report immediately unusual back or abdominal pain, acute headache, difficulty breathing or chest tightness, difficulty swallowing, itching or rash, redness, swelling, or pain at infusion site. Between treatments, maintain adequate hydration (2-3 L/day of fluids, u unless instructed to restrict fluid intake) and nutrition (small frequent meals). You may experience loss of appetite, nausea, dry mouth, or taste changes (frequent oral care, sucking lozenges, or chewing gum may help); loss of hair (will grow back when therapy is completed); or muscle or skeletal pain (consult prescriber for appropriate analgesia). Report immediately any unusual bleeding (blood in urine or stool, nose bleeds, vaginal bleeding, bleeding from wound); abdominal pain, constipation, and vomiting; acute headache, dizziness, or confusion; seizure, visions changes, or unusual lethargy; changes in urinary pattern; pain, redness, swelling, or loss of sensation in extremities; unusual bleeding (blood in urine or stool, nose bleeds, vaginal bleeding); skin rash; unusual infection (respiratory or urinary tract); or any other adverse reactions. **Pregnancy precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Avastin®: 25 mg/mL (4 mL, 16 mL)

Generic AvailableNo

ManufacturerGenentech

Pricing: U.S. (www.drugstore.com)

Solution (Avastin)

100 mg/4 mL (4): $645.98

400 mg/16 mL (16): $2499.75

Mechanism of ActionBevacizumab is a recombinant, humanized monoclonal antibody which binds to, and neutralizes, vascular endothelial growth factor (VEGF), preventing its association with endothelial receptors, Flt-1 and KDR. VEGF binding initiates angiogenesis (endothelial proliferation and the formation of new blood vessels). The inhibition of microvascular growth is believed to retard the growth of all tissues (including metastatic tissue).

Pharmacodynamics/Kinetics

Distribution: V_d: 46 mL/kg

Half-life elimination: ~20 days (range: 11-50 days)

Excretion: Clearance: 2.75-5 mL/kg/day

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), stomatitis, taste disorder, and gingival bleeding.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause confusion

Mental Health: Effects on Psychiatric TreatmentGastrointestinal side effects are common; these effects may be additive with concurrent use of SSRIs, acetylcholinesterase inhibitors, aripiprazole, or ziprasidone. Hematologic adverse effects are common; use caution with clozapine, carbamazepine, valproate, mirtazapine. May cause hypokalemia; use caution with ziprasidone.

Bexarotene

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(beks AIR oh teen)

U.S. Brand NamesTargretin®

Canadian Brand NamesTargretin®

Pharmacologic CategoryAntineoplastic Agent, Miscellaneous

Use: Labeled Indications

Oral: Treatment of cutaneous manifestations of cutaneous T-cell lymphoma in patients who are refractory to at least one prior systemic therapy

Topical: Treatment of cutaneous lesions in patients with refractory cutaneous T-cell lymphoma (stage 1A and 1B) or who have not tolerated other therapies

Dosing: Adults

Cutaneous T-cell lymphoma: Oral: 300-400 mg/m^2/day taken as a single daily dose.

Cutaneous lesions of T-cell lymphoma: Topical: Apply to lesions once every other day for first week, then increase on a weekly basis to once daily, 2 times/day, 3 times/day, and finally 4 times/day, according to tolerance.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo studies have been conducted; however, renal insufficiency may result in significant protein binding changes and alter pharmacokinetics of bexarotene.

Dosing: Hepatic ImpairmentNo studies have been conducted; however, hepatic impairment would be expected to result in decreased clearance of bexarotene due to the extensive hepatic contribution to elimination.

Calculations

- Body Surface Area: Adults

Administration: OralAdminister capsule following a fat-containing meal.

Administration: TopicalAllow gel to dry before covering with clothing. Avoid application to normal skin. Use of occlusive dressings is not recommended.

Dietary ConsiderationsIt is preferable to take the oral capsule following a fat-containing meal.

StorageStore at 2°C to 25°C (36°F to 77°F). Protect from light.

ContraindicationsHypersensitivity to bexarotene or any component of the formulation; pregnancy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Hypothyroidism: In about a third of patients, hypothyroidism occurs; monitor.
- Leukopenia: Leukopenia and neutropenia may occur (may be delayed); monitor for signs and symptoms of infection about 4-8 weeks after initiation.
- Lipid effects: Induces significant lipid abnormalities in a majority of patients (triglyceride, total cholesterol, and HDL); reversible on discontinuation. Use extreme caution in patients with underlying hypertriglyceridemia.
- Liver function test abnormalities: Monitor for liver function test abnormalities and discontinue drug if tests are three times the upper limit of normal values for AST, ALT, or bilirubin.
- Pancreatitis: Pancreatitis secondary to hypertriglyceridemia has been reported. Patients with risk factors for pancreatitis (eg, prior pancreatitis, uncontrolled hyperlipidemia, excess ethanol consumption, uncontrolled diabetes, biliary tract disease) should generally not receive bexarotene (oral).

- Photosensitivity: May cause photosensitization.
- Visual disturbances: Any new visual abnormalities experienced by the patient should be evaluated by an ophthalmologist (cataracts can form, or worsen, especially in the geriatric population).

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus.
- Hepatic impairment: Use only with extreme caution in patients with hepatic impairment.

Concurrent drug therapy issues:

- Vitamin A: Limit additional vitamin A intake to <15,000 int. units/day.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: **[U.S. Boxed Warning]: Bexarotene is a retinoid, a drug class associated with birth defects in humans; do not administer during pregnancy.** Pregnancy test needed 1 week before initiation and every month thereafter. Effective contraception must be in place 1 month before initiation, during therapy, and for at least 1 month after discontinuation. Male patients with sexual partners who are pregnant, possibly pregnant, or who could become pregnant, must use condoms during sexual intercourse during treatment and for 1 month after last dose.

Pregnancy Risk FactorX

Pregnancy Considerations**[U.S. Boxed Warning]: Bexarotene is a retinoid, a drug class associated with birth defects in humans; do not administer during pregnancy.** Bexarotene caused birth defects when administered orally to pregnant rats. It must not be given to a pregnant woman or a woman who intends to become pregnant. If a woman becomes pregnant while taking the drug, it must be stopped immediately and appropriate counseling be given. Women of childbearing potential should use two forms of reliable contraception, one should be nonhormonal.

LactationExcretion in breast milk unknown/contraindicated

Adverse ReactionsFirst percentage is at a dose of 300 mg/m^2/day; the second percentage is at a dose >300 mg/m^2/day.

Oral:

>10%:

Cardiovascular: Peripheral edema (13% to 11%)

Central nervous system: Headache (30% to 42%), chills (10% to 13%)

Dermatologic: Rash (17% to 23%), exfoliative dermatitis (10% to 28%)

Endocrine & metabolic: Hyperlipidemia (about 79% in both dosing ranges), hypercholesteremia (32% to 62%), hypothyroidism (29% to 53%)

Hematologic: Leukopenia (17% to 47%)

Neuromuscular & skeletal: Weakness (20% to 45%)

Miscellaneous: Infection (13% to 23%)

<10%:

Cardiovascular: Hemorrhage, hypertension, angina pectoris, right heart failure, tachycardia, cerebrovascular accident, syncope

Central nervous system: Fever (5% to 17%), insomnia (5% to 11%), subdural hematoma, depression, agitation, ataxia, confusion, dizziness, hyperesthesia

Dermatologic: Dry skin (about 10% for both dosing ranges), alopecia (4% to 11%), skin ulceration, acne, skin nodule, maculopapular rash, serous drainage, vesicular bullous rash, cheilitis

Endocrine & metabolic: Hypoproteinemia, hyperglycemia, weight loss/gain, breast pain

Gastrointestinal: Abdominal pain (11% to 4%), nausea (16% to 8%), diarrhea (7% to 42%), vomiting (4% to 13%), anorexia (2% to 23%), constipation, xerostomia, flatulence, colitis, dyspepsia, gastroenteritis, gingivitis, melena, pancreatitis, serum amylase increased

Genitourinary: Albuminuria, hematuria, urinary incontinence, urinary tract infection, urinary urgency, dysuria, kidney function abnormality

Hematologic: Hypochromic anemia (4% to 13%), anemia (6% to 25%), eosinophilia, thrombocythemia, coagulation time increased, lymphocytosis, thrombocytopenia

Hepatic: LDH increased (7% to 13%), hepatic failure

Neuromuscular & skeletal: Back pain (2% to 11%), arthralgia, myalgia, bone pain, myasthenia, arthrosis, neuropathy

Ocular: Dry eyes, conjunctivitis, blepharitis, corneal lesion, visual field defects, keratitis

Otic: Ear pain, otitis externa

Renal: Creatinine increased

Respiratory: Pharyngitis, rhinitis, dyspnea, pleural effusion, bronchitis, cough increased, lung edema, hemoptysis, hypoxia

Miscellaneous: Flu-like syndrome (4% to 13%), bacterial infection (1% to 13%)

Topical:

Cardiovascular: Edema (10%)

Central nervous system: Headache (14%), weakness (6%), pain (30%)

Dermatologic: Rash (14% to 72%), pruritus (6% to 40%), contact dermatitis (14%), exfoliative dermatitis (6%)

Hematologic: Leukopenia (6%), lymphadenopathy (6%)

Neuromuscular & skeletal: Paresthesia (6%)

Respiratory: Cough (6%), pharyngitis (6%)

Miscellaneous: Diaphoresis (6%), infection (18%)

Oncology: Emetic PotentialLow (10% to 30%)
Metabolism/Transport Effects**Substrate** of CYP3A4 (minor); **Induces** CYP3A4 (weak)
Drug Interactions

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Retinoic Acid Derivatives may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): Retinoic Acid Derivatives may diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. *Risk C: Monitor therapy*

Tetracycline Derivatives: May enhance the adverse/toxic effect of Retinoic Acid Derivatives. The development of pseudotumor cerebri is of particular concern. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Take with a fat-containing meal. Bexarotene serum levels may be increased by grapefruit juice; avoid concurrent use.

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization). St John's wort may decrease bexarotene levels. Additional vitamin A supplements may lead to vitamin A toxicity (dry skin, irritation, arthralgias, myalgias, abdominal pain, hepatic changes).

Monitoring ParametersIf female, pregnancy test 1 week before initiation then monthly while on bexarotene; lipid panel before initiation, then weekly until lipid response established and then at 8-week intervals thereafter; baseline LFTs, repeat at 1, 2, and 4 weeks after initiation then at 8-week intervals thereafter if stable; baseline and periodic thyroid function tests; baseline CBC with periodic monitoring
Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions. Assess results of laboratory tests (pregnancy, lipid panel, LFTs, thyroid function, CBC) prior to and during therapy. Assess therapeutic response (reduction of cutaneous lesions), and adverse reactions (eg, CNS or cardiovascular effects, opportunistic infection, visual abnormalities, hypoglycemia). Teach patient proper use according to formulation, side effects/appropriate interventions, and symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Instruct female patients of childbearing age and males who may have intercourse with females of childbearing age about appropriate use of barrier contraceptives 1 month prior to, during, and 1 month following treatment.
Monitoring: Lab TestsIf female, pregnancy test 1 week before initiation then monthly while on bexarotene; lipid panel before initiation, then weekly until lipid response established and then at 8-week intervals thereafter; baseline LFTs, repeat at 1, 2, and 4 weeks after initiation then at 8-week intervals thereafter if stable; baseline and periodic thyroid function tests; baseline CBC with periodic monitoring
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Use exactly as directed; it is preferable to take capsules after a fat-containing meal. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid grapefruit juice, St John's wort, or additional vitamin A supplements while using this medication. You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea, vomiting, anorexia, flatulence (frequent, small meals, good mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluid, fruit, or fiber may help); diarrhea (buttermilk, boiled milk, or yogurt may help); headache, back or muscle pain (consult prescriber for mild analgesic); or photosensitivity (avoid direct sunlight, wear protective clothing and hat, use sunblock, and protective eyewear). Report chest pain, rapid heartbeat; unresolved GI effects; headache, back or muscle pain; skin dryness, skin rash or peeling; mucous membrane lesions; altered urinary patterns; flu syndrome or opportunistic infection (eg, weakness, fatigue, white plaques or sores in mouth, vaginal discharge, chills, fever); CNS disturbances (insomnia, dizziness, agitation, confusion, depression); vision or hearing changes; or any other adverse effects. **Pregnancy/breast-feeding precautions:** Pregnancy test is needed 1 week before initiation of therapy and every month during therapy. Consult prescriber for appropriate barrier contraceptives if necessary or if you suspect you might be pregnant. Effective contraception must be in place 1 month before initiation, during therapy, and for at least 1 month after discontinuation. Male patients with sexual partners who are pregnant, possibly pregnant, or who could become pregnant, must use condoms when having sexual intercourse while using this medication and for 1 month after last dose. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Do not breast-feed.

Oral: Take exactly as directed, at the same time each day with a fat-containing meal. If you miss a dose, take as soon as possible. If it is almost time for next dose, skip the missed dose and continue on regular schedule. Do not double doses.

Topical: Apply as directed. Allow gel to dry before covering. Avoid applying to normal skin or mucous membranes. Do not use occlusive dressings.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Targretin®: 75 mg

Gel: 1% (60 g)

Targretin®: 1% (60 g) [contains dehydrated alcohol]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Targretin)

75 mg (30): $686.79

Mechanism of ActionThe exact mechanism is unknown. Binds and activates retinoid X receptor subtypes. Once activated, these receptors function as transcription factors that regulate the expression of genes which control cellular differentiation and proliferation. Bexarotene inhibits the growth *in vitro* of some tumor cell lines of hematopoietic and squamous cell origin.

Pharmacodynamics/Kinetics

Absorption: Significantly improved by a fat-containing meal

Protein binding: >99%

Metabolism: Hepatic via CYP3A4 isoenzyme; four metabolites identified; further metabolized by glucuronidation

Half-life elimination: 7 hours

Time to peak: 2 hours

Excretion: Primarily feces; urine (<1% as unchanged drug and metabolites)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and gingivitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia, agitation, confusion, and depression

Mental Health: Effects on Psychiatric TreatmentLeukopenia is common; use caution with clozapine and carbamazepine; effects of psychotropics may be altered secondary to the insomnia, confusion, agitation, and depression seen with bexarotene

Bezafibrate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(be za FYE brate)

Canadian Brand NamesBezalip®; PMS-Bezafibrate

Pharmacologic CategoryAntilipemic Agent, Fibric Acid

Use: Labeled IndicationsAdjunct to diet and other therapeutic measures for treatment of type IIa and IIb mixed hyperlipidemia, to regulate lipid and apoprotein levels (reduce serum TG, LDL-cholesterol, and apolipoprotein B, increase HDL-cholesterol and apolipoprotein A); treatment of adult patients with high to very high triglyceride levels (Fredrickson classification type IV and V hyperlipidemias) who are at high risk of sequelae and complications from their dyslipidemia

Dosing: Adults

Dyslipidemia: Oral:

> *Immediate release:* 200 mg 2-3 times/day; may reduce to 200 mg twice daily in patients with good response
>
> *Sustained release:* 400 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} >60 mL/minute: 200 mg 3 times/day

Cl_{cr} 60-40 mL/minute: 200 mg 2 times/day

Cl_{cr} 40-15 mL/minute: 200 mg every 1-2 days

Cl_{cr} <15 mL/minute: 200 mg every 3 days

Hemodialysis: 200 mg every 3 days

Calculations

- Creatinine Clearance: Adults

Administration: Oral

Immediate release: Swallow tablet without chewing and with sufficient fluid, with or after meals.

Sustained release: Swallow tablet without chewing and with sufficient fluid; Take in morning or evening with or after meals.

Dietary ConsiderationsShould be taken with or after meals. Before initiation of therapy, patients should be placed on a standard lipid-lowering diet for 6 weeks and the diet should be continued during drug therapy.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from high humidity.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to bezafibrate, fibrates, or any component of the formulation; hepatic or renal dysfunction; primary biliary cirrhosis; pre-existing gallbladder disease; concurrent use of MAO inhibitors; pregnancy or breast-feeding; not indicated for the treatment of type I hyperlipoproteinemia

Allergy Considerations

- Fibric Acid Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hepatic effects: Has been shown to be hepatotoxic; discontinue if response is not obtained in 3 months. Use with caution in patients with history of jaundice or hepatic disorder; abnormal liver function tests have been observed (reversible when discontinued).
- Myopathy/rhabdomyolysis: Has been associated with rare myositis or rhabdomyolysis; patients should be monitored closely. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine.
- Tumorigenic: Has been shown to be possibly tumorigenic (animal models); discontinue if response is not obtained in 3 months.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment, hypoalbuminemia, or nephrotic syndrome; dosage reduction required.

Concurrent drug therapy issues:

- HMG-CoA reductase inhibitors: Use caution with HMG-CoA reductase inhibitors; may lead to myopathy, rhabdomyolysis.
- Warfarin: Use with caution in patient taking warfarin; adjustments in warfarin therapy may be required.

Special populations:

- Pediatrics: Limited experience is available in children; therefore, caution should be used when treating children.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

Pregnancy Risk FactorNot available; not recommended (per manufacturer)

Pregnancy ConsiderationsEmbryotoxicity has occurred in animals at toxic doses. Women planning pregnancy should discontinue bezafibrate several months before conception; strict birth control procedures must be exercised.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsDo not use during lactation due to absence of data concerning the presence of bezafibrate in human breast milk.

Adverse Reactions

1% to 10%

Central nervous system: Dizziness (2%), insomnia (1%), migraine (1%), pain (1%)

Dermatologic: Pruritus (3%), eczema (1%), rash

Gastrointestinal: Gastritis (6%), flatulence (5%), dyspepsia (3%), nausea, diarrhea, constipation

Hematologic: Anemia (1%)

Hepatic: Transaminases increased

Miscellaneous: Allergic reaction (1%)

Neuromuscular & skeletal: CPK increased

Renal: Creatinine increased

<1%: Alkaline phosphatase increased, alopecia, asthenia, cholelithiasis, epigastric distress, erythema, headache, impotence, muscle pain, muscle cramps, myopathy, rhabdomyolysis, urticaria

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)

Drug Interactions

Bile Acid Sequestrants: May decrease the absorption of Fibric Acid Derivatives. **Exceptions:** Colesevelam. *Risk D: Consider therapy modification*

Ezetimibe: Fibric Acid Derivatives may increase the serum concentration of Ezetimibe. *Risk C: Monitor therapy*

Sulfonylureas: Fibric Acid Derivatives may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Fibric Acid Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Test InteractionsGlucose, creatinine, ALT, TG, and CPK

Monitoring ParametersPeriodic evaluation of serum lipids, cholesterol, and triglycerides (especially in the first few months of therapy). LFTs after 3-6 months; then annually. CBC (periodically during the first 12 months). Fasting glucose, creatinine, and CPK periodically.

Monitoring: Lab TestsPeriodic evaluation of serum lipids, cholesterol, and triglycerides (especially in the first few months of therapy). LFTs after 3-6 months; then annually. CBC (periodically during the first 12 months). Fasting glucose, creatinine, and CPK periodically.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet, immediate release: 200 mg [not available in the U.S.]

PMA-Bezafibrate [CAN]: 200 mg [not available in the U.S.]

Tablet, sustained release:

Bezalip® [CAN]: 400 mg [not available in the U.S.]

Generic AvailableYes: 200 mg immediate release only

Mechanism of ActionMechanism not definitely established; may increase VLDL catabolism by increasing lipoprotein and hepatic triglyceride lipase activities; attenuation of triglyceride biosynthesis by inhibition of acetyl-CoA carboxylase; decreased cholesterol biosynthesis by inhibition of 3-hydroxy-3-methyglutaryl-coenzyme A reductase

Pharmacodynamics/Kinetics

Absorption: Immediate release: Almost completely; Sustained release: 70%

Distribution: 17 L

Protein binding: 94% to 96%

Half-life elimination: 1-2 hours

Time to peak, serum: Immediate release: 1-2 hours; Sustained release: 3-4 hours

Excretion: Urine (95%); feces (3%)

Pharmacotherapy PearlsNot available in U.S.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or insomnia

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors

Canadian Brand NamesCasodex®; CO Bicalutamide; Gen-Bicalutamide; Novo-Bicalutamide; PHL-Bicalutamide; PMS-Bicalutamide; Pro-Bicalutamide; ratio-Bicalutamide; Sandoz-Bicalutamide

Pharmacologic CategoryAntineoplastic Agent, Antiandrogen

Use: Labeled IndicationsIn combination therapy with LHRH agonist analogues in treatment of metastatic prostate cancer

Use: Unlabeled/InvestigationalMonotherapy for locally-advanced prostate cancer

Dosing: Adults

Metastatic prostate cancer: Oral: 50 mg once daily (in combination with an LHRH analogue)

Locally-advanced prostate cancer (unlabeled use): Oral: 150 mg once daily (as monotherapy)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment required

Dosing: Hepatic ImpairmentNo adjustment required for mild, moderate, or severe hepatic impairment; use caution with moderate-to-severe impairment. Discontinue if ALT >2 times ULN or patient develops jaundice.

Dosing: Combination Regimens

Prostate cancer: Bicalutamide + LHRH-A

Administration: OralDose should be taken at the same time each day with or without food. Treatment should be started concomitantly with an LHRH analogue.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to bicalutamide or any component of the formulation; female patients; pregnancy

Allergy Considerations

- Bicalutamide Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Gynecomastia: May cause gynecomastia or breast pain.
- Hepatitis: Rare cases of death or hospitalization due to hepatitis have been reported postmarketing; hepatotoxicity generally occurs within the first 3-4 months of use. Use with caution in moderate-to-severe hepatic dysfunction. Patients should be monitored for signs and symptoms of liver dysfunction; discontinue if patients have jaundice or ALT is >2 times the upper limit of normal.
- Spermatogenesis: May lead to spermatogenesis inhibition.

Geriatric ConsiderationsRenal impairment has no clinically-significant changes in elimination of the parent compound or active metabolite; therefore, no dosage adjustment is needed in the elderly. In dosage studies, no difference was found between young adults and elderly with regard to steady-state serum concentrations for bicalutamide and its active R-enantiomer metabolite.

Pregnancy Risk FactorX

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenicity. Bicalutamide is not indicated for women.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsBicalutamide is not indicated for use in women.

Adverse ReactionsAdverse reaction percentages reported as part of combination regimen with an LHRH analogue.

>10%:

Cardiovascular: Peripheral edema (13%)

Central nervous system: Pain (35%)

Endocrine & metabolic: Hot flashes (53%)

Gastrointestinal: Constipation (22%), nausea (15%), diarrhea (12%), abdominal pain (11%)

Genitourinary: Pelvic pain (21%), nocturia (12%), hematuria (12%)

Hematologic: Anemia (11%)

Neuromuscular & skeletal: Back pain (25%), weakness (22%)

Respiratory: Dyspnea (13%)

Miscellaneous: Infection (18%)

≥2% to 10%:

Cardiovascular: Chest pain (8%), hypertension (8%), angina pectoris (2% to <5%), CHF (2% to <5%), edema (2% to <5%), MI (2% to <5%), coronary artery disorder (2% to <5%), syncope (2% to <5%)

Central nervous system: Dizziness (10%), headache (7%), insomnia (7%), anxiety (5%), depression (4%), chills (2% to <5%), confusion (2% to <5%), fever (2% to <5%), nervousness (2% to <5%), somnolence (2% to <5%)

Dermatologic: Rash (9%), alopecia (2% to <5%), dry skin (2% to <5%), pruritus (2% to <5%), skin carcinoma (2% to <5%)

Endocrine & metabolic: Gynecomastia (9%), breast pain (6%; up to 39% as monotherapy), hyperglycemia (6%), dehydration (2% to <5%), gout (2% to <5%), hypercholesterolemia (2% to <5%), libido decreased (2% to <5%)

Gastrointestinal: Dyspepsia (7%), weight loss (7%), anorexia (6%), flatulence (6%), vomiting (6%), weight gain (5%), dysphagia (2% to <5%), gastrointestinal carcinoma (2% to <5%), melena (2% to <5%), periodontal abscess (2% to <5%), rectal hemorrhage (2% to <5%), xerostomia (2% to <5%)

Genitourinary: Urinary tract infection (9%), impotence (7%), polyuria (6%), urinary retention (5%), urinary impairment (5%), urinary incontinence (4%), dysuria (2% to <5%), urinary urgency (2% to <5%)

Hepatic: LFTs increased (7%), alkaline phosphatase increased (5%)

Neuromuscular & skeletal: Bone pain (9%), paresthesia (8%), myasthenia (7%), arthritis (5%), pathological fracture (4%), hypertonia (2% to <5%), leg cramps (2% to <5%), myalgia (2% to <5%), neck pain (2% to <5%), neuropathy (2% to <5%)

Ocular: Cataract (2% to <5%)

Renal: BUN increased, creatinine increased, hydronephrosis

Respiratory: Cough (8%), pharyngitis (8%), bronchitis (6%), pneumonia (4%), rhinitis (4%), asthma (2% to <5%), epistaxis (2% to <5%), sinusitis (2% to <5%)

Miscellaneous: Flu syndrome (7%), diaphoresis (6%), cyst (2% to <5%), hernia (2% to <5%), herpes zoster (2% to <5%), sepsis (2% to <5%)

Postmarketing and/or case reports: Bilirubin increased, hemoglobin decreased, hepatitis, hypersensitivity reactions (including angioneurotic edema and urticaria), interstitial pneumonitis, pulmonary fibrosis, WBC decreased

Oncology: Emetic PotentialVery low (<10%)

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersPeriodically monitor CBC, ECG, echocardiograms, serum testosterone, luteinizing hormone, and prostate specific antigen. Liver function tests should be obtained at baseline and repeated regularly during the first 4 months of treatment, and periodically thereafter; monitor for signs and symptoms of liver dysfunction (discontinue if jaundice is noted or ALT is >2 times the upper limit of normal).

Nursing: Physical Assessment/MonitoringUse caution in presence of hepatic impairment. Monitor prothrombin time closely in patients taking coumarin-derivative anticoagulants concomitantly. Assess results of laboratory tests (LFTs) at baseline and periodically during therapy. Assess therapeutic effectiveness (eg, slowed disease progression) and adverse effects regularly. Advise patients with diabetes to monitor glucose levels closely (may induce hyperglycemia). Teach patient appropriate use (including absolute need for barrier contraceptives), possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Instruct patient on absolute need for barrier contraceptives.

Monitoring: Lab TestsLiver function tests should be obtained at baseline and repeated regularly during the first 4 months of treatment, and periodically thereafter (in addition to monitoring signs/symptoms of liver dysfunction). Discontinue if jaundice is noted or ALT is >2 times the upper limit of normal. Periodically monitor CBC, ECG, echocardiograms, serum testosterone, luteinizing hormone, and prostate specific antigen.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, at the same time each day, with or without food. Do not alter dose or discontinue this medicine without consulting prescriber. If you have diabetes, monitor serum glucose closely and notify prescriber of changes (this medication may alter glucose levels). May cause dizziness, confusion, or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); constipation (increased exercise, fluids, fruit, or fiber may help); hair loss; or impotence. Report easy bruising or bleeding; yellowing of skin or eyes; change in color of urine or stool; unresolved CNS changes (eg, nervousness, chills, insomnia, somnolence); skin rash, redness, or irritation; chest pain or palpitations; respiratory difficulty; urinary retention or inability to void; muscle weakness, tremors, or pain; persistent nausea, vomiting, diarrhea, constipation; or other unusual signs or adverse reactions. **Pregnancy/breast-feeding precautions:** This drug will cause fetal abnormalities - consult prescriber for effective contraceptives.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 50 mg

Generic AvailableNo

ManufacturerAstraZeneca Pharmaceuticals LP

Pricing: U.S. (www.drugstore.com)

Tablets (Casodex)

50 mg (30): $478.36

Mechanism of ActionPure nonsteroidal antiandrogen that binds to androgen receptors; specifically a competitive inhibitor for the binding of dihydrotestosterone and testosterone; prevents testosterone stimulation of cell growth in prostate cancer

Pharmacodynamics/Kinetics

Absorption: Rapid and complete

Protein binding: 96%

Metabolism: Extensively hepatic; glucuronidation and oxidation of the R (active) enantiomer to inactive metabolites

Half-life elimination: Active enantiomer ~6 days, ~10 days in severe liver disease

Time to peak, plasma: 31 hours

Excretion: Urine (36%, as inactive metabolites); feces (42%, as unchanged drug and inactive metabolites)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay produce anxiety, depression, and confusion

Mental Health: Effects on Psychiatric TreatmentNone reported

Bimatoprost

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(bi MAT oh prost)

U.S. Brand NamesLumigan®

Canadian Brand NamesLumigan®

Pharmacologic CategoryOphthalmic Agent, Antiglaucoma; Prostaglandin, Ophthalmic

Use: Labeled IndicationsReduction of intraocular pressure (IOP) in patients with open-angle glaucoma or ocular hypertension

Dosing: AdultsOpen-angle glaucoma or ocular hypertension: Ophthalmic: Instill 1 drop into affected eye(s) once daily in the evening; do not exceed once-daily dosing (may decrease IOP-lowering effect). If used with other topical ophthalmic agents, separate administration by at least 5 minutes.

Dosing: ElderlyRefer to adult dosing.

Administration: OtherMay be used with other eye drops to lower intraocular pressure. If using more than one ophthalmic product, wait at least 5 minutes in between application of each medication. Remove contact lenses prior to administration and wait 15 minutes before reinserting.

StorageStore between 2°C to 25°C (36°F to 77°F).

ContraindicationsHypersensitivity to bimatoprost or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Bacterial keratitis: Inadvertent contamination of multiple-dose ophthalmic solutions, has caused bacterial keratitis.
- Ocular effects: May permanently change/increase brown pigmentation of the iris, the eyelid skin, and eyelashes. In addition, may increase the length and/or number of eyelashes (may vary between eyes); changes occur slowly and may not be noticeable for months or years. Long-term consequences and potential injury to eye are not known.

Disease-related concerns:

- Ocular disease: Use with caution in patients with intraocular inflammation, aphakic patients, pseudophakic patients with a torn posterior lens capsule, or patients with risk factors for macular edema. Safety and efficacy have not been determined for use in patients with angle-closure-, inflammatory-, or neovascular glaucoma.

Special populations:

- Contact lens wearers: Contains benzalkonium chloride which may be adsorbed by contact lenses; remove contacts prior to administration and wait 15 minutes before reinserting.
- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsEvaluate patient's ability to self-administer eye drops

Pregnancy Risk FactorC

Pregnancy ConsiderationsDecreased gestation, decreased body weight, increased late resorptions, and increased mortality were observed in animal studies with oral doses achieving serum levels >33 times human exposure. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Ocular (15% to 45%): Conjunctival hyperemia, growth of eyelashes, ocular pruritus

1% to 10%:

- Central nervous system: Headache (1% to 5%)
- Dermatologic: Hirsutism (1% to 5%)
- Hepatic: Liver function tests abnormal (1% to 5%)
- Neuromuscular & skeletal: Weakness (1% to 5%)
- Ocular:
    - 3% to 10%: Blepharitis, burning, cataract, dryness, eyelid redness, eyelash darkening, foreign body sensation, irritation, pain, pigmentation of periocular skin, superficial punctate keratitis, visual disturbance
    - 1% to 3%: Allergic conjunctivitis, asthenopia, conjunctival edema, discharge, iris pigmentation increased, photophobia, tearing
- Respiratory: Upper respiratory tract infection (10%)

<1%: Iritis

Postmarketing and/or case reports: Bacterial keratitis (caused by inadvertent contamination of multiple-dose ophthalmic solutions), macular edema

Drug Interactions

Latanoprost: The concomitant use of Latanoprost and Bimatoprost may result in increased intraocular pressure. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic response and adverse effects. Teach patient proper use, side effects/appropriate interventions, and symptoms to report.

Patient EducationFor use in eyes only. Wash hands before instilling. Sit or lie down to instill. Open eye, look at ceiling, and instill prescribed amount of solution. Apply gentle pressure to inner corner of eye. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Contact prescriber concerning continued use of drops if eye infection develops, trauma occurs to the eye, and prior to eye surgery. This product contains benzalkonium chloride which may be adsorbed by contact lenses; remove contacts prior to administration and wait 15 minutes before reinserting. May cause permanent changes in eye color (increases the amount of brown pigment in the iris), eyelid, and eyelashes. May also increase the length and/or number of eyelashes. Changes may occur slowly (months to years). May be used with other eye drops to lower intraocular pressure. If using more than one eye drop medicine, wait at least 5 minutes in between application of each medication. Notify prescriber if conjunctivitis or eyelid reactions occur with use of this product. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant or breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic:

Lumigan®: 0.03% (2.5 mL, 5 mL, 7.5 mL) [contains benzalkonium chloride]

Generic AvailableNo

ManufacturerAllergan, Inc

Pricing: U.S. (www.drugstore.com)

Solution (Lumigan)

0.03% (2.5): $74.89

0.03% (5): $145.51

0.03% (7.5): $221.47

Mechanism of ActionAs a synthetic analog of prostaglandin with ocular hypotensive activity, bimatoprost decreases intraocular pressure by increasing the outflow of aqueous humor.

Pharmacodynamics/Kinetics

Onset of action: Reduction of IOP: ~4 hours

Peak effect: Maximum reduction of IOP: ~8-12 hours

Distribution: 0.67 L/kg

Protein binding: ~88%

Metabolism: Undergoes oxidation, N-demethylation, and glucuronidation after reaching systemic circulation; forms metabolites

Half-life elimination: I.V.: 45 minutes

Time to peak: 10 minutes

Excretion: Urine (67%); feces (25%)

Related Information

- Glaucoma Drug Therapy

Pharmacotherapy PearlsThe IOP-lowering effect was shown to be 7-8 mm Hg in clinical studies.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Doxidan® may be confused with doxepin

Modane® may be confused with Matulane®, Moban®

Pronunciation(bis a KOE dil)

U.S. Brand NamesAlophen® [OTC]; Bisac-Evac™ [OTC]; Bisacodyl Uniserts® [OTC] [DSC]; Biscolax™ [OTC]; Correctol® Tablets [OTC]; Dacodyl™ [OTC]; Doxidan® [OTC]; Dulcolax® [OTC]; ex-lax® Ultra [OTC]; Fematrol [OTC]; Femilax™ [OTC]; Fleet® Bisacodyl [OTC]; Fleet® Stimulant Laxative [OTC]; Veracolate [OTC]

Canadian Brand NamesApo-Bisacodyl®; Carter's Little Pills®; Dulcolax®; Gentlax®

Pharmacologic CategoryLaxative, Stimulant

Use: Labeled IndicationsTreatment of constipation; colonic evacuation prior to procedures or examination

Dosing: Adults

Relief of constipation:

Oral: 5-15 mg as single dose (up to 30 mg when complete evacuation of bowel is required)

Rectal: Suppository: 10 mg as single dose

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Relief of constipation:

Oral: Children >6 years: 5-10 mg (0.3 mg/kg) at bedtime or before breakfast

Rectal (suppository): Children:

<2 years: 5 mg as a single dose

>2 years: 10 mg

Administration: OralAdminister with a glass of water on an empty stomach for rapid effect. Do not administer within 1 hour of milk, any dairy products, or taking an antacid, to protect the coating.

Dietary ConsiderationsShould not be administered within 1 hour of milk, any dairy products, or taking an antacid, to protect the coating. Should be administered with a glass of water on an empty stomach for rapid effect.

ContraindicationsHypersensitivity to bisacodyl or any component of the formulation; abdominal pain or obstruction, nausea, or vomiting

Geriatric ConsiderationsThe chronic use of stimulant cathartics is inappropriate and should be avoided; although constipation is a common complaint from elderly, such complaints require evaluation; elderly are often predisposed to constipation due to disease, drugs, immobility, and a decreased fluid intake, partially because they have a blunted “thirst reflex” with aging; short-term use of stimulants is best; if prophylaxis is desired, this can be accomplished with bulk agents (psyllium), stool softeners, and hyperosmotic agents (sorbitol 70%); stool softeners are unnecessary if stools are well hydrated, soft, or “mushy”.

Pregnancy Risk FactorC

Adverse Reactions<1%:

Central nervous system: Vertigo

Endocrine & metabolic: Electrolyte and fluid imbalance (metabolic acidosis or alkalosis, hypocalcemia)

Gastrointestinal: Mild abdominal cramps, nausea, vomiting, rectal burning

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Antacids: May diminish the therapeutic effect of Bisacodyl. Antacids may cause the delayed-release bisacodyl tablets to release drug prior to reaching the large intestine. Gastric irritation and/or cramps may occur. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Milk or dairy products may disrupt enteric coating, increasing stomach irritation.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Solution, rectal [enema]:

Fleet® Bisacodyl: 10 mg/30 mL (37 mL)

Suppository, rectal: 10 mg

Bisac-Evac™, Bisacodyl Uniserts® [DSC], Biscolax™, Dulcolax®: 10 mg

Tablet [enteric coated]: 5 mg

Alophen®, Bisac-Evac™, Correctol®, Dacodyl™, Dulcolax®, ex-lax® Ultra, Fematrol, Femilax™, Veracolate: 5 mg

Tablet, delayed release: 5 mg

Doxidan®, Fleet® Stimulant Laxative: 5 mg

Generic AvailableYes: Excludes enema

Pricing: U.S. (www.drugstore.com)

Suppository (Bisacodyl)

10 mg (100): $18.99

Mechanism of ActionStimulates peristalsis by directly irritating the smooth muscle of the intestine, possibly the colonic intramural plexus; alters water and electrolyte secretion producing net intestinal fluid accumulation and laxation

Pharmacodynamics/Kinetics

Onset of action: Oral: 6-10 hours; Rectal: 0.25-1 hour

Absorption: Oral, rectal: Systemic, <5%

Bismuth, Metronidazole, and Tetracycline

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(BIZ muth, me troe NI da zole, & tet ra SYE kleen)

U.S. Brand NamesHelidac®; Pylera™

Pharmacologic CategoryAntibiotic, Miscellaneous; Antibiotic, Tetracycline Derivative; Antidiarrheal

Use: Labeled IndicationsAs part of a multidrug regimen for *H. pylori* eradication to reduce the risk of duodenal ulcer recurrence in combination with an H_2 agonist (Helidac®) or omeprazole (Pylera™)

Dosing: AdultsDuodenal ulcer associated with *H. pylori* infection: Oral:

Helidac®: Two bismuth subsalicylate 262.4 mg tablets, 1 metronidazole 250 mg tablet, and 1 tetracycline 500 mg capsule 4 times/day at meals and bedtime, plus an H_2 antagonist (at the appropriate dose) for 14 days; follow with 8 oz of water; the H_2 antagonist should be continued for a total of 28 days

Pylera™: Three capsules 4 times/day after meals and at bedtime, plus omeprazole 20 mg twice daily for 10 days; follow each dose with 8 oz of water (each capsule contains bismuth subcitrate potassium 140 mg, metronidazole 125 mg, and tetracycline 125 mg)

Dosing: ElderlyRefer to adult dosing.

Administration: Oral

Helidac®: Chew bismuth tablets; swallow **(do not chew)** metronidazole and tetracycline. Take with a full glass (8 oz) of water. Administer an H_2 antagonist at appropriate dose.

Pylera™: Swallow capsules whole with full glass of water. Administer omeprazole after morning meal and evening meal.

StorageStore at 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to bismuth, metronidazole, tetracycline, or any component of the formulation; children; significant renal/hepatic impairment; pregnancy

Helidac® is also contraindicated in patients with hypersensitivity to salicylates

Warnings/PrecautionsSee individual agents.

Pregnancy Risk FactorD

Pregnancy ConsiderationsSee individual agents.

LactationEnters breast milk/contraindicated

Hepatic: ALT increased (2%), AST increased (1%)

Neuromuscular & skeletal: Weakness (4%), back pain (2%)

Respiratory: Pharyngitis (2%), rhinitis (1%)

Miscellaneous: Flu-like syndrome (5%), infection (1% to 2%)

<1%: Cough, flatulence, rash, sinusitis

Metabolism/Transport Effects

Metronidazole: **Inhibits** CYP2C8/9 (weak), 3A4 (moderate)

Tetracycline: **Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (moderate)

Drug Interactions

Alcohol (Ethyl): MetroNIDAZOLE may enhance the adverse/toxic effect of Alcohol (Ethyl). A disulfiram-like reaction may occur. *Risk C: Monitor therapy*

Amprenavir: MetroNIDAZOLE may enhance the adverse/toxic effect of Amprenavir. This is specifically related to the propylene glycol contained in amprenavir oral solution, not capsules. *Risk X: Avoid combination*

Antacids: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Atovaquone: Tetracycline may decrease the serum concentration of Atovaquone. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Bismuth: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Bismuth Subsalicylate: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Busulfan: MetroNIDAZOLE may increase the serum concentration of Busulfan. *Risk D: Consider therapy modification*

Calcineurin Inhibitors: MetroNIDAZOLE may decrease the metabolism of Calcineurin Inhibitors. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May enhance the adverse/toxic effect of MetroNIDAZOLE. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Tetracycline Derivatives. Only a concern with orally administered products. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mebendazole: May enhance the adverse/toxic effect of MetroNIDAZOLE. Particularly the risk for Stevens-Johnson Syndrome or Toxic Epidermal Necrolysis may be increased. *Risk D: Consider therapy modification*

Mycophenolate: MetroNIDAZOLE may decrease the serum concentration of Mycophenolate. Specifically, metronidazole may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Tetracycline Derivatives may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Penicillins: Tetracycline Derivatives may diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Quinapril: May decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: Tetracycline Derivatives may enhance the adverse/toxic effect of Retinoic Acid Derivatives. The development of pseudotumor cerebri is of particular concern. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Tetracycline Derivatives: Bismuth may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Tipranavir: MetroNIDAZOLE may enhance the adverse/toxic effect of Tipranavir. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): MetroNIDAZOLE may decrease the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Tetracycline Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zinc Salts: May decrease the absorption of Tetracycline Derivatives. Only a concern when both products are administered orally. **Exceptions:** Zinc Chloride. *Risk D: Consider therapy modification*

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Pylera™: Bismuth subcitrate potassium 140 mg, metronidazole 125 mg, and tetracycline hydrochloride 125 mg

Combination package:

Helidac® [each package contains 14 blister cards (2-week supply); each card contains the following]:

Capsule: Tetracycline hydrochloride: 500 mg (4)

Tablet, chewable: Bismuth subsalicylate: 262.4 mg (8)

Tablet: Metronidazole: 250 mg (4)

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Misc (Helidac)

(56): $304.69

Mechanism of ActionBismuth, metronidazole, and tetracycline individually have demonstrated *in vitro* activity against most susceptible strains of *H. pylori* isolated from patients with duodenal ulcers. Resistance to metronidazole is increasing in the U.S.; an alternative regimen, not containing metronidazole, if *H. pylori* is not eradicated follow therapy.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Bismuth
- MetroNIDAZOLE
- Tetracycline

Dental Health: Effects on Dental TreatmentTetracyclines are not recommended for use during pregnancy since they can cause enamel hypoplasia and permanent teeth discoloration; long-term use associated with oral candidiasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness common; metronidazole has been reported to cause depression, insomnia, confusion, panic, delusions, hallucinations, and exacerbation of schizophrenia; tetracycline has been reported to produce memory disturbances as well as mood stabilizing and antidepressant effects

Mental Health: Effects on Psychiatric TreatmentMetronidazole and tetracycline may increase serum lithium levels and produce lithium toxicity; monitor serum lithium levels

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Kaopectate® may be confused with Kayexalate®

Maalox® Total Stomach Relief® is a different formulation than Maalox®

Note: Canadian formulation of Kaopectate® does not contain bismuth; the active ingredient in the Canadian formulation is attapulgite.

Pronunciation(BIZ muth)

U.S. Brand NamesBismatrol Maximum Strength [OTC]; Bismatrol [OTC]; Diotame® [OTC]; Kao-Tin [OTC]; Kaopectate® Extra Strength [OTC]; Kaopectate® [OTC]; Kapectolin [OTC]; Maalox® Total Stomach Relief® [OTC]; Peptic Relief [OTC]; Pepto Relief [OTC]; Pepto-Bismol® Maximum Strength [OTC]; Pepto-Bismol® [OTC]

Pharmacologic CategoryAntidiarrheal

Use: Labeled IndicationsSubsalicylate formulation: Symptomatic treatment of mild, nonspecific diarrhea; control of traveler's diarrhea (enterotoxigenic *Escherichia coli*); as part of a multidrug regimen for *H. pylori* eradication to reduce the risk of duodenal ulcer recurrence

Dosing: Adults

Treatment of nonspecific diarrhea, control/relieve traveler's diarrhea: Oral: Subsalicylate (doses based on 262 mg/15 mL liquid or 262 mg tablets): 2 tablets or 30 mL every 30 minutes to 1 hour as needed up to 8 doses/24 hours

***Helicobacter pylori*eradication:** Oral: Subsalicylate: 524 mg 4 times/day with meals and at bedtime; requires combination therapy

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Nonspecific diarrhea, control/relieve traveler's diarrhea: Subsalicylate (doses based on 262 mg/5 mL liquid or 262 mg tablet): Oral:

Children: Up to 8 doses/24 hours:

3-6 years: $^1/_3$ tablet or 5 mL every 30 minutes to 1 hour as needed

6-9 years: $^2/_3$ tablet or 10 mL every 30 minutes to 1 hour as needed

9-12 years: 1 tablet or 15 mL every 30 minutes to 1 hour as needed

>12 years: Refer to adult dosing

Dosing: Renal ImpairmentShould probably be avoided in patients with renal impairment.

Administration: OralLiquids must be shaken prior to use. Chewable tablets should be chewed thoroughly. Nonchewable caplets should be swallowed whole with a full glass of water.

Dietary ConsiderationsDrink plenty of fluids to help prevent dehydration caused by diarrhea. Different dosage forms contain variable amounts of sodium; consult individual product labeling.

ContraindicationsHypersensitivity to bismuth or any component of the formulation

Subsalicylate formulation: Do not use subsalicylate in patients with influenza or chickenpox because of risk of Reye's syndrome; hypersensitivity to salicylates or any component of the formulation; history of severe GI bleeding; history of coagulopathy; pregnancy (3rd trimester)

Warnings/Precautions

Concerns related to adverse effects:

- Neurotoxicity: Bismuth products may be neurotoxic with very large doses.

Concurrent drug therapy issues:

- Aspirin: Bismuth subsalicylate should be used with caution if patient is taking aspirin.

Special populations:

- Pediatrics: Use with caution in children, especially those <3 years of age and those with viral illness.

Other warnings/precautions:

- Self-medication (OTC use): Children and teenagers who have or are recovering from chickenpox or flu-like symptoms should not use subsalicylate. Changes in behavior (along with nausea and vomiting) may be an early sign of Reye's syndrome; patients should be instructed to contact their healthcare provider if these occur. Patients should be instructed to contact healthcare provider for diarrhea lasting >2 days, hearing loss, or ringing in the ears. Not labeled for OTC use in children <12 years of age.

Geriatric ConsiderationsTinnitus and CNS side effects (confusion, dizziness, high tone deafness, delirium, psychosis) may be difficult to assess in some elderly patients. Limit use of this agent in elderly.

Pregnancy Risk FactorC/D (3rd trimester)

LactationExcretion in breast milk unknown (salicylates enter breast milk)/use caution

Adverse ReactionsFrequency not defined; subsalicylate formulation:

Central nervous system: Anxiety, confusion, headache, mental depression, slurred speech

Gastrointestinal: Discoloration of the tongue (darkening), grayish black stools, impaction may occur in infants and debilitated patients

Neuromuscular & skeletal: Muscle spasms, weakness

Ocular: Hearing loss, tinnitus

Drug Interactions

Tetracycline Derivatives: Bismuth may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Test InteractionsIncreased uric acid, increased AST; bismuth absorbs x-rays and may interfere with diagnostic procedures of GI tract

Nursing: Physical Assessment/MonitoringAssess patient allergy history prior to beginning treatment (contains ASA). Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, aspirin products). Assess therapeutic effectiveness (reduction in diarrhea) and adverse response (eg, CNS changes, impactions, tinnitus). Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Chew tablet well or shake suspension well before using. Maintain adequate fluid intake to prevent dehydration: 2-3 L/day of fluids (unless instructed to restrict fluid intake). May darken stools and turn tongue black. If diarrhea persists for more than 2 days, consult healthcare provider. If tinnitus (ringing in the ears) occurs this may indicate toxicity; discontinue use and notify healthcare provider. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to be pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet, as subsalicylate:

Kaopectate®: 262 mg

Pepto-Bismol®: 262 mg [sugar free; contains sodium 2 mg/caplet]

Liquid, as subsalicylate: 262 mg/15 mL (240 mL)

Bismatrol: 262 mg/15 mL (240 mL)

Bismatrol Maximum Strength: 525 mg/15 mL (240 mL)

Diotame®: 262 mg/15 mL (30 mL) [sugar free]

Kaopectate®: 262 mg/15 mL (240 mL, 360 mL) [contains potassium 5 mg/15 mL, sodium 10 mg/15 mL; regular and peppermint flavors]

Kaopectate®: 262 mg/15 mL (180 mL) [contains sodium 10 mg/15 mL; cherry flavor]

Kaopectate® Extra Strength: 525 mg/15 mL (240 mL) [contains potassium 5 mg/15 mL, sodium 10 mg/15 mL; peppermint flavor]

Kao-Tin: 262 mg/15 mL (240 mL, 480 mL) [contains sodium benzoate]

Maalox® Total Stomach Relief®: 525 mg/15 mL (360 mL) [contains sodium 3.3 mg/15mL; strawberry and peppermint flavor]

Peptic Relief: 262 mg/15 mL (240 mL) [sugar free; mint flavor]

Pepto-Bismol®: 262 mg/15 mL (120 mL, 240 mL, 360 mL, 480 mL) [sugar free; contains sodium 6 mg/15 mL and benzoic acid; cherry and wintergreen flavors]

Pepto-Bismol® Maximum Strength: 525 mg/15 mL (120 mL, 240 mL, 360 mL) [sugar free; contains sodium 6 mg/15 mL and benzoic acid; wintergreen flavor]

Suspension, as subsalicylate:

Kapectolin: 262 mg/15 mL (480 mL) [mint flavor]

Tablet, chewable, as subsalicylate: 262 mg

Bismatrol: 262 mg

Diotame®: 262 mg [sugar free]

Peptic Relief, Pepto Relief: 262 mg

Pepto-Bismol®: 262 mg [sugar free; contains sodium <1 mg; cherry and wintergreen flavors]

Generic AvailableYes

Mechanism of Action

Bismuth subsalicylate exhibits both antisecretory and antimicrobial action. This agent may provide some anti-inflammatory action as well. The salicylate moiety provides antisecretory effect and the bismuth exhibits antimicrobial directly against bacterial and viral gastrointestinal pathogens.

Pharmacodynamics/Kinetics

Absorption: Bismuth: <1%; Subsalicylate: >90%

Metabolism: Bismuth subsalicylate is converted to salicylic acid and insoluble bismuth salts in the GI tract.

Half-life elimination: Terminal: Bismuth: Highly variable

Excretion: Bismuth: Urine and feces; Salicylate: Urine

Related Information

- Antimicrobial Drugs of Choice

Pharmacotherapy Pearls

Bismuth subcitrate potassium is bismuth salt that is only available in the combination product Pylera™, approved for use as part of a multidrug regimen for *H. pylori* eradication. It is not available as a single-agent product.

Dental Health: Effects on Dental Treatment

Key adverse event(s) related to dental treatment: Darkening of tongue.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions

No information available to require special precautions

Mental Health: Effects on Mental Status

May rarely cause anxiety, confusion, or depression

Mental Health: Effects on Psychiatric Treatment

None reported

Index Terms

Bismatrol; Bismuth Subsalicylate; Pink Bismuth

Ziac® may be confused with Tiazac®, Zerit®

Pronunciation(bis OH proe lol & hye droe klor oh THYE a zide)
U.S. Brand NamesZiac®
Canadian Brand NamesZiac®
Pharmacologic CategoryBeta Blocker, Beta$_1$ Selective; Diuretic, Thiazide
Use: Labeled IndicationsTreatment of hypertension
Use: Unlabeled/InvestigationalPediatric hypertension
Dosing: AdultsHypertension: Oral: Dose is individualized, given once daily.
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Hypertension (unlabeled use): Oral: Initial: Bisoprolol 2.5 mg/hydrochlorothiazide 6.25 mg once daily; up to a maximum of bisoprolol 10 mg/hydrochlorothiazide 6.25 mg daily

Dosing: Hepatic ImpairmentCaution should be used in dosing/titrating patients.
ContraindicationsHypersensitivity to bisoprolol, hydrochlorothiazide, or any component of the formulation; pregnancy 2nd and 3rd trimesters
Allergy Considerations

- Beta-Blocker Allergy
- Thiazide/Thiazide-Related Diuretic Allergy

Pregnancy Risk FactorC/D (2nd and 3rd trimesters)
LactationEnters breast milk/use caution
Adverse Reactions

>10%: Central nervous system: Fatigue

1% to 10%:

Cardiovascular: Chest pain, edema, bradycardia, hypotension

Central nervous system: Headache, dizziness, depression, abnormal dreams, insomnia

Dermatologic: Rash, photosensitivity

Endocrine & metabolic: Hypokalemia, fluid and electrolyte imbalances (hypocalcemia, hypomagnesemia, hyponatremia), hyperglycemia

Gastrointestinal: Constipation, diarrhea, dyspepsia, nausea, flatulence

Genitourinary: Micturition (frequency)

Hematologic: Blood dyscrasias (rare)

Neuromuscular & skeletal: Arthralgia, myalgia

Ocular: Abnormal vision

Renal: Prerenal azotemia

Respiratory: Rhinitis, cough, dyspnea

<1% (Limited to important or life-threatening): Angioedema, bronchospasm, CNS depression (sedation), exfoliative dermatitis, gout, hypercalcemia, orthostasis, pancreatitis, paresthesia, Peyronie's disease, syncope, vasculitis

Metabolism/Transport EffectsBisoprolol: **Substrate** of CYP2D6 (minor), 3A4 (major)
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Related Information

- Bisoprolol
- Hydrochlorothiazide

Dental Health: Effects on Dental TreatmentBisoprolol is a cardioselective beta-blocker. Local anesthetic with vasoconstrictor can be safely used in patients medicated with bisoprolol. Nonselective beta-blockers (ie, propranolol, nadolol) enhance the pressor response to epinephrine, resulting in hypertension and bradycardia; this has not been reported for bisoprolol. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusFatigue is common; may cause insomnia, confusion, depression, dizziness, headache, sleep disturbance, vivid dreams, anxiety, restlessness, and decreased concentration
Mental Health: Effects on Psychiatric TreatmentBarbiturates may decrease the effects of beta-blockers; may decrease lithium clearance, resulting in elevated serum lithium levels and potential lithium toxicity; monitor serum lithium levels
Cardiovascular ConsiderationsCombination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for bisoprolol and hydrochlorothiazide combination therapy may include improved compliance and synergistic reductions in blood pressure with an accomplished reduction in side effects. Beta-blockers and thiazide diuretics are first-line therapies for the treatment of hypertension. See Cardiovascular Considerations for individual agents.
Index TermsHydrochlorothiazide and Bisoprolol

Medication Safety Issues

Sound-alike/look-alike issues:

Zebeta® may be confused with DiaBeta®, Zetia®

Pronunciation(bis OH proe lol)

U.S. Brand NamesZebeta®

Canadian Brand NamesApo-Bisoprolol®; Monocor®; Novo-Bisoprolol; PMS-Bisoprolol; Sandoz-Bisoprolol; Zebeta®

Pharmacologic CategoryBeta Blocker, Beta$_1$ Selective

Use: Labeled IndicationsTreatment of hypertension, alone or in combination with other agents

Use: Unlabeled/InvestigationalChronic stable angina, supraventricular arrhythmias, PVCs, heart failure (HF)

Dosing: Adults

Hypertension: Oral: 2.5-5 mg once daily; may be increased to 10 mg and then up to 20 mg once daily, if necessary; usual dose range (JNC 7): 2.5-10 mg once daily

HF (unlabeled use): Initial: 1.25 mg once daily; maximum recommended dose: 10 mg once daily. **Note:** Increase dose gradually and monitor for signs and symptoms of CHF.

Dosing: ElderlyOral: Initial: 2.5 mg/day; may be increased by 2.5-5 mg/day; maximum recommended dose: 20 mg/day

Dosing: Renal Impairment

Cl$_{cr}$ <40 mL/minute: Oral: Initial: 2.5 mg/day; increase cautiously

Not dialyzable

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsMay be taken without regard to meals.

ContraindicationsCardiogenic shock; overt cardiac failure; marked sinus bradycardia; heart block greater than first-degree (except in patients with a functioning artificial pacemaker)

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Concerns related to adverse events:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; for patients with bronchospastic disease who do not respond to or cannot tolerate other therapies, initial low doses of beta$_1$-selective bisoprolol may be employed and used cautiously with close monitoring. Ensure patient has an inhaled beta$_2$-agonist immediately available. At doses ≥20 mg/day, slight asymptomatic increases in airway resistance and decreases in forced expiratory volume (FEV$_1$) has been observed.

- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.

- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.

- Heart failure (HF): Use with caution in patients with compensated heart failure and monitor for a worsening of the condition. Patients should be stabilized on heart failure regimen prior to initiation of beta-blocker. Beta-blocker therapy should be initiated at very low doses with gradual and very careful titration. Adjustment of other medications (ACE inhibitors and/or diuretics) may be required

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment required with severe impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis.

- Peripheral vascular disease (PVD) and Raynaud's disease: Can precipitate or aggravate symptoms of arterial insufficiency in patients with PVD and Raynaud's disease. Use with caution and monitor for progression of arterial obstruction.

- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.
- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required with Cl_{cr} <40 mL/minute.
- Thyrotoxicosis: Beta-blockade may mask signs of hyperthyroidism (eg, tachycardia). Abrupt discontinuation of beta-blockade may exacerbate symptoms of hyperthyroidism and may also induce thyroid storm.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents which decrease myocardial function (eg, ether, cyclopropane, and trichloroethylene).
- Calcium channel blockers: Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block may occur.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.

Geriatric ConsiderationsDue to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (ie, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20% to 50% in elderly populations. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults.

Pregnancy Risk FactorC (manufacturer); D (2nd and 3rd trimesters - expert analysis)

Pregnancy ConsiderationsNo data available on whether bisoprolol crosses the placenta. Beta-blockers have been associated with persistent bradycardia, hypotension, and IUGR; IUGR is probably related to maternal hypertension. Available evidence suggests beta-blockers are generally safe during pregnancy (JNC 7). Cases of neonatal hypoglycemia have been reported following maternal use of beta-blockers at parturition or during breast-feeding. Monitor breast-fed infant for symptoms of beta-blockade.

LactationEnters breast milk/use caution

Adverse Reactions

1% to 10%:

Cardiovascular: Chest pain (1% to 2%)

Central nervous system: Fatigue (dose related; 6% to 8%), insomnia (2% to 3%), hypoesthesia (1% to 2%)

Gastrointestinal: Diarrhea (dose related; 3% to 4%), nausea (2%), vomiting (1% to 2%)

Neuromuscular & skeletal: Arthralgia, asthenia (dose related; ≤2%)

Respiratory: Upper respiratory infection (5%), rhinitis (3% to 4%), sinusitis (dose related; 2%), dyspnea (1% to 2%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Abdominal pain, acne, alopecia, angioedema, anxiety, arrhythmia, asthma, back/neck pain, bradycardia (dose related), bronchitis, bronchospasm, BUN/creatinine increased, claudication, cold extremities, confusion (especially in the elderly), congestive heart failure, constipation, coughing, cutaneous vasculitis, cystitis, depression, dermatitis, dizziness, dyspepsia, dyspnea on exertion, eczema, edema, flushing, gastritis, gout, hallucinations, headache, hearing decreased, hyper-/hypoesthesia, hyperglycemia, hyperkalemia, hyperphosphatemia, hypertriglyceridemia, hypotension, impotence, lacrimation (abnormal), leukopenia, libido decreased, malaise, memory loss, muscle cramps, muscle/joint pain, nervousness, ocular pain/pressure, orthostatic hypotension, palpitations, paresthesia, peptic ulcer, Peyronie's disease, pharyngitis, polyuria, positive ANA titers, pruritus, psoriasis, psoriasiform eruption, purpura, rash, renal colic, restlessness, rhythm disturbances, sleep disturbances, somnolence, syncope, taste abnormality, thrombocytopenia, tinnitus, transaminases increased, tremor, twitching, uric acid increased, vasculitis, vertigo, visual disturbances, weight gain, xerostomia

Metabolism/Transport Effects**Substrate** of CYP2D6 (minor), 3A4 (major)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure, ECG, neurologic status

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Blood pressure and heart rate should be assessed prior to and following first dose and with any change in dosage. Assess for therapeutic effectiveness and adverse effects. Instruct patients with diabetes to monitor glucose levels closely (beta-blockers may alter glucose tolerance). Teach patient proper use, possible side effects/appropriate interventions (hypotension precautions), and adverse symptoms to report.

Monitoring: Lab TestsSerum glucose regularly (if you have diabetes)

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed, with or without regard to meals. Do not take with antacids. Do not adjust dosage or discontinue medication without consulting prescriber. Take pulse daily (prior to medication) and follow prescriber's instruction about holding medication. If you have diabetes, monitor serum sugar closely (drug may alter glucose tolerance or mask signs of hypoglycemia). May cause fatigue, dizziness, or postural hypotension (use caution when changing position from lying or sitting to standing, when driving, or climbing stairs until response to medication is known); alteration in sexual performance (reversible); or constipation (increased dietary bulk and fluids and exercise may help). Report unresolved swelling of extremities, respiratory difficulty or new cough, unresolved fatigue, unusual weight gain, unresolved constipation, or unusual muscle weakness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as fumarate: 5 mg, 10 mg

Generic AvailableYes

ManufacturerLederle Laboratories

Pricing: U.S. (www.drugstore.com)

Tablets (Bisoprolol Fumarate)

5 mg (30):	$32.99
10 mg (30):	$35.13

Tablets (Zebeta)

5 mg (30):	$91.26
10 mg (30):	$91.26

Mechanism of ActionSelective inhibitor of beta$_1$-adrenergic receptors; competitively blocks beta$_1$-receptors, with little or no effect on beta$_2$-receptors at doses ≤20 mg

Pharmacodynamics/Kinetics

Onset of action: 1-2 hours

Absorption: Rapid and almost complete

Distribution: Widely; highest concentrations in heart, liver, lungs, and saliva; crosses blood-brain barrier; enters breast milk

Protein binding: ~30%

Metabolism: Extensively hepatic; significant first-pass effect (~20%)

Bioavailability: ~80%

Half-life elimination: Normal renal function: 9-12 hours; Cl$_{cr}$ <40 mL/minute: 27-36 hours; Hepatic cirrhosis: 8-22 hours

Time to peak: 2-4 hours

Excretion: Urine (50% as unchanged drug, remainder as inactive metabolites); feces (<2%)

Related Information

- Beta-Blockers

Dental Health: Effects on Dental TreatmentBisoprolol is a cardioselective beta-blocker. Local anesthetic with vasoconstrictor can be safely used in patients medicated with bisoprolol. Nonselective beta-blockers (ie, propranolol, nadolol) enhance the pressor response to epinephrine, resulting in hypertension and bradycardia; this has not been reported for bisoprolol. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusFatigue is common; may cause insomnia, confusion, depression, dizziness, headache, sleep disturbance, vivid dreams, anxiety, restlessness, and decreased concentration

Mental Health: Effects on Psychiatric TreatmentBarbiturates may decrease the effects of beta-blockers

Cardiovascular Considerations

Atrial Fibrillation: Beta-blocker therapy provides effective rate control in patients with atrial fibrillation.

Chronic Stable Angina: Beta-blockers are effective in the treatment of angina as monotherapy or when combined with nitrates and/or calcium channel blockers. In patients with severe intractable angina requiring negative cardiac chronotropic medications, pacemaker placement has been carried out to maintain heart rate in the setting of large doses of beta-blockers and/or calcium channel blockers. Beta-blockers are ineffective in the treatment of pure vasospastic (Prinzmetal) angina.

Heart Failure: Strong evidence supports that beta-blocker therapy, without intrinsic sympathomimetic activity (ISA), should be initiated in select patients with stable congestive heart failure (NYHA Class II-III). To date, carvedilol, sustained release metoprolol, and bisoprolol have demonstrated a beneficial effect on morbidity and mortality. It is important that beta-blocker therapy be instituted initially at very low doses with gradual and very careful titration. In the CIBIS-II trial, bisoprolol (beta-1 selective beta-blocker) improved morbidity and mortality in patients with moderate heart failure (NYHA Class III-IV).

Hypertension: Beta-blocker therapy in the treatment of hypertension has been associated with improved cardiovascular outcomes. According to the 2003 JNC-VII guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Beta-blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for a beta-blocker include patients with heart failure, post myocardial infarction, high coronary disease risk, or diabetes. In type-2 diabetic patients, a UK Prospective Diabetes Study Group (UKPDS) trial showed that beta-blocker therapy (atenolol) was as effective as an ACE inhibitor in reducing cardiovascular events and that the benefits of therapy were related more to the degree of antihypertensive efficacy rather than the class of drug used.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

ST-segment Elevation Myocardial Infarction (STEMI): Beta-blockers, without intrinsic sympathomimetic activity (ISA), have been shown to decrease morbidity and mortality when initiated in the acute treatment of STEMI and continued long-term. Oral beta-blockade should be initiated promptly in patients without contraindications (eg, signs of heart failure, evidence of a low-output state, risk of cardiogenic shock, or other beta-blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade may be considered and given promptly if the patient is experiencing concomitant hypertension or a tachyarrhythmia (Class IIa recommendation).

Unstable Angina/Non-ST-Segment Elevation MI (UA/NSTEMI): In the treatment of UA/NSTEMI, oral beta-blockade should be initiated within the first 24 hours in patients without contraindications (eg, signs of heart failure, evidence of a low-output state, risk of cardiogenic shock, or other beta blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade should only be considered if the patient is experiencing concomitant hypertension upon presentation (Class IIa recommendation).

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered to avoid acute tachycardia and hypertension.

Anesthesia and Critical Care Concerns/Other Considerations**Surgery:** Based on available evidence, beta-blockers should be started days to weeks before elective surgery in selected patients when possible and titrated to a heart rate <65 beats per minute. Additional data suggest that long acting beta-blockers may be superior to short acting ones (Redelmeier, 2005). The ACC/AHA 2007 guidelines on perioperative cardiovascular evaluation and care for noncardiac surgery recommend beta-blockers be continued in patients undergoing surgery who are receiving beta-blockers to treat angina, symptomatic arrhythmias, hypertension, or other ACC/AHA Class I guideline indications (Class I recommendation). The guidelines also recommend that beta-blockers be given to patients undergoing vascular surgery who have myocardial ischemia demonstrated during preoperative testing (Class I recommendation).

The guidelines also state that beta-blockers are probably recommended in patients undergoing intermediate risk (eg, carotid endarterectomy, prostate surgery) or vascular surgery in whom preoperative assessment identifies coronary heart disease or high cardiac risk (Class IIa recommendation). High cardiac risk is defined as having >1 of the following clinical risk factors: History of ischemic heart disease, compensated or prior heart failure, cerebrovascular disease, diabetes mellitus, or renal insufficiency. The use of beta-blockers is uncertain in patients undergoing intermediate risk or vascular surgery with ≤1 clinical risk factor (Class IIb recommendation).

The majority of published trials suggest a benefit of perioperative beta-blocker use during noncardiac surgery especially in high-risk patients; however, more recent clinical trials have not shown a benefit to perioperative beta-blockade for noncardiac surgery (Juul, 2006; Yang, 2006).

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(bye VAL i roo din)
U.S. Brand NamesAngiomax®
Canadian Brand NamesAngiomax®
Pharmacologic CategoryAnticoagulant, Thrombin Inhibitor
Use: Labeled IndicationsAnticoagulant used in conjunction with aspirin for patients with unstable angina undergoing percutaneous transluminal coronary angioplasty (PTCA) or percutaneous coronary intervention (PCI) with provisional glycoprotein IIb/IIIa inhibitor; anticoagulant used in patients undergoing PCI with (or at risk of) heparin-induced thrombocytopenia (HIT) / thrombosis syndrome (HITTS)
Use: Unlabeled/InvestigationalHeparin-induced thrombocytopenia (HIT)
Dosing: Adults
Acute coronary syndromes (moderate-high risk) undergoing invasive strategy (unlabeled dose): Initial dose: 0.1 mg/kg bolus, followed by 0.25 mg/kg/hour. Prior to PCI, give an additional bolus of 0.5 mg/kg and increase infusion rate to 1.75 mg/kg/hour.

Anticoagulant in patients undergoing PTCA/PCI or PCI with HITS/HITTS (treatment should be started just prior to procedure): I.V.: Initial: Bolus: 0.75 mg/kg, followed by continuous infusion: 1.75 mg/kg/hour for the duration of procedure and up to 4 hours postprocedure if needed; determine ACT 5 minutes after bolus dose; may administer additional bolus of 0.3 mg/kg if necessary.

A glycoprotein IIb/IIIa inhibitor may be administered concomitantly during the procedure.

If needed, infusion may be continued beyond initial 4 hours at 0.2 mg/kg/hour for up to 20 hours.

Cardiac surgery (unlabeled; Warkentin, 2008):

Off-pump: Initial bolus: 0.75 mg/kg, followed by continuous infusion 1.75 mg/kg/hour to maintain ACT >300 seconds

On-pump: Initial bolus: 1 mg/kg, followed by continuous infusion 2.5 mg/kg/hour; 50 mg bolus added to priming solution of cardiopulmonary bypass (CPB) circuit

Additional boluses of 0.1-0.5 mg may be given to maintain ACT >2.5 times baseline ACT. **Note:** Special maneuvers needed to prevent stasis and consequent clotting within CPB circuit during or after surgery.

HIT (unlabeled use; Warkentin, 2008): Normal renal function: Initial dose: ~0.15 mg/kg/hour; adjust to aPTT 1.5-2.5 times baseline value

Dosing: ElderlyRefer to adult dosing. No dosage adjustment is needed in elderly patients with normal renal function. Puncture site hemorrhage and catheterization site hemorrhage were seen in more patients ≥65 years of age than in patients <65 years of age.
Dosing: Renal ImpairmentInfusion dose should be reduced based on degree of renal impairment. Initial bolus dose remains unchanged. Monitor activated coagulation time (ACT) or aPTT depending on indication.

For use in PCI:

Cl_{cr} ≥30 mL/minute: No adjustment required

Cl_{cr} 10-29 mL/minute: Decrease infusion rate to 1 mg/kg/hour

Dialysis-dependent patients (off dialysis): Decrease infusion rate to 0.25 mg/kg/hour

Clearance of bivalirudin remains 1.8-fold greater than the glomerular filtration rate, regardless of the degree in renal impairment.

Hemodialysis: Approximately 25% removed during hemodialysis

Dosing: Hepatic ImpairmentNo adjustment necessary.
Calculations

- Creatinine Clearance: Adults

Administration: I.V.For I.V. administration only.
StorageStore unopened vials at 15°C to 30°C. Following reconstitution, vials should be stored at 2°C to 8°C. Do not freeze. Final dilutions of 0.5 mg/mL or 5 mg/mL are stable at room temperature for up to 24 hours.
ReconstitutionReconstitute each 250 mg with 5 mL SWFI. Gently swirl to dissolve. Further dilution in D_5W or NS (50 mL to make 5 mg/mL solution **or** 500 mL to make 0.5 mg/mL solution) is required prior to infusion. Do not administer in same line with other medications.
CompatibilityStable in D_5W, NS, or sterile water for injection; do not administer in same line with other medications.

Y-site administration: Compatible: Dobutamine (concentration up to 4 mg/mL). **Incompatible:** Alteplase, amiodarone, amphotericin B, chlorpromazine, diazepam, dobutamine (concentration of 12.5 mg/mL), prochlorperazine, reteplase, streptokinase, vancomycin.

Contraindications Hypersensitivity to bivalirudin or any component of the formulation; active major bleeding

Allergy Considerations

- Hirudin Derivatives Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: The most common complication is bleeding. Certain patients are at increased risk of bleeding; risk factors include bacterial endocarditis; congenital or acquired bleeding disorders; recent puncture of large vessels or organ biopsy; recent CVA, stroke, intracerebral surgery, or other neuraxial procedure; severe uncontrolled hypertension; renal impairment; recent major surgery; recent major bleeding (intracranial, GI, intraocular, or pulmonary). Monitor for signs and symptoms of bleeding.
- Thrombus formation: Increased risk of thrombus formation (some fatal) has been reported with use in gamma brachytherapy.

Disease-related concerns:

- Angina/ACS: Safety and efficacy have not been established in patients with unstable angina or acute coronary syndromes who are not undergoing PTCA or PCI.
- Renal impairment: Use with caution in patients with renal impairment; dosage reduction required.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Intramuscular administration: Not for intramuscular (I.M.) use.

Pregnancy Risk Factor B

Pregnancy Considerations Although animal studies have not shown harm to the fetus, safety and efficacy for use in pregnant women have not been established. Bivalirudin is used in conjunction with aspirin, which may lead to maternal or fetal adverse effects, especially during the third trimester. Use during pregnancy only if clearly needed.

Lactation Excretion in breast milk unknown/use caution

Adverse Reactions As with all anticoagulants, bleeding is the major adverse effect of bivalirudin. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the intensity of anticoagulation and patient susceptibility. Additional adverse effects are often related to idiosyncratic reactions, and the frequency is difficult to estimate. Adverse reactions reported were generally less than those seen with heparin.

>10%:

Cardiovascular: Hypotension (3% to 12%)

Central nervous system: Pain (15%), headache (3% to 12%)

Gastrointestinal: Nausea (3% to 15%)

Neuromuscular & skeletal: Back pain (9% to 42%)

1% to 10%:

Cardiovascular: Hypertension (6%), bradycardia (5%), angina (up to 5%)

Central nervous system: Insomnia (7%), anxiety (6%), fever (5%), nervousness (5%)

Gastrointestinal: Vomiting (6%), dyspepsia (5%), abdominal pain (5%)

Genitourinary: Urinary retention (4%)

Hematologic: Major hemorrhage (2% to 4%, compared to 4% to 9% with heparin); transfusion required (1% to 2%, compared to 2% to 6% with heparin), thrombocytopenia (<1% to 4%)

Local: Injection site pain (3% to 8%)

Neuromuscular & skeletal: Pelvic pain (6%)

<1%: Cerebral ischemia, confusion, facial paralysis, fever, infection, intracranial bleeding, kidney failure, lung edema, oliguria, retroperitoneal bleeding, sepsis, syncope, vascular anomaly, ventricular fibrillation

Postmarketing and/or case reports: Fatal bleeding, allergic reaction (including anaphylaxis), thrombus formation (during PCI, including intracoronary brachytherapy)

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Test InteractionsPT/INR levels may become elevated in the absence of warfarin. If warfarin is initiated, initial PT/INR goals while on bivalirudin may require modification.
Monitoring ParametersDepends upon indication for use of bivalirudin: ACT or aPTT
Monitoring: Lab TestsDepends upon indication for use of bivalirudin: ACT or aPTT
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 250 mg

Generic AvailableNo
Mechanism of ActionBivalirudin acts as a specific and reversible direct thrombin inhibitor; it binds to the catalytic and anionic exosite of both circulating and clot-bound thrombin. Catalytic binding site occupation functionally inhibits coagulant effects by preventing thrombin-mediated cleavage of fibrinogen to fibrin monomers, and activation of factors V, VIII, and XIII. Shows linear dose- and concentration-dependent prolongation of ACT, aPTT, PT, and TT.
Pharmacodynamics/Kinetics

Onset of action: Immediate

Duration: Coagulation times return to baseline ~1 hour following discontinuation of infusion

Distribution: 0.2 L/kg

Protein binding, plasma: Does not bind other than thrombin

Metabolism: Blood proteases

Half-life elimination: Normal renal function: 25 minutes; Cl_{cr} 10-29 mL/minute: 57 minutes; Dialysis-dependent patients (off dialysis): 3.5 hours

Excretion: Urine (20%), proteolytic cleavage

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: As with all anticoagulants, bleeding is the major adverse effect of bivalirudin. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the intensity of anticoagulation and patient susceptibility. Additional adverse effects are often related to idiosyncratic reactions, and the frequency is difficult to estimate. Adverse reactions reported were generally less than those seen with heparin.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause insomnia, anxiety, or nervousness
Mental Health: Effects on Psychiatric TreatmentNausea is common; this effect may be additive with concurrent use of SSRIs, lithium, or valproate. Do not administer bivalirudin in the same intravenous line with chlorpromazine, diazepam, or prochlorperazine; this results in haze formation, microparticulate formation, or gross precipitation.
Cardiovascular Considerations

Acute Coronary Syndromes (ACS): In the ACUITY trial, patients with moderate- or high-risk ACS undergoing an early invasive strategy with GP IIb/IIIa inhibition, developed similar rates of ischemia and bleeding when receiving bivalirudin as compared to heparin (Stone, 2005). Use of bivalirudin alone was associated with similar rates of ischemia with less bleeding as compared to either heparin (or bivalirudin) plus GP IIb/IIIa inhibition. ACUITY was an open-label, randomized, multicenter, noninferiority trial in which 13,819 patients were randomized to either bivalirudin plus GPIIb/IIIa inhibition, heparin plus GP IIb/IIIa inhibition, or bivalirudin alone. Patients were excluded if they had STEMI or shock, bleeding diathesis, major bleeding episode within 2 weeks prior, thrombocytopenia, or a Cl_{cr} <30 mL/minute. Patients who received bivalirudin received an initial bolus dose of 0.1 mg/kg followed by a continuous infusion of 0.25 mg/kg/hour prior to angiography. If the patient required PCI, the patient received an additional 0.5 mg/kg IV bolus with an increase in the infusion rate to 1.75 mg/kg/hour. Ninety-nine percent of all patients underwent angiography within 19.6 hours after admission. PCI was performed in 56%, CABG was performed in 11%, and 33% received medical therapy.

Cardiac Surgery: Bivalirudin has been used as an anticoagulant in CABG surgery as documented by case reports, case series (Koster, 2003; 2004), and more recently larger clinical trials. Bivalirudin binds to both exosite 1 and the active site of thrombin, producing only transient inhibition of thrombin. This is because thrombin cleaves bivalirudin and allows the active site to function again. This may be problematic in cases where there is not continuous blood flow through catheters, autotransfusion machines (eg, cell-saver devices), or intravenous lines (eg, CABG).

A number of clinical trials have demonstrated effectiveness in cardiac surgery for patients **without** HIT/HITTS (Merry, 2004; Smedira, 2006; Dyke, 2006). However, higher rates of bleeding with the use of bivalirudin as an alternative to heparin/protamine during cardiac surgery preclude its routine use in this setting.

Two prospective, open-label, multicenter trials demonstrated the safety and efficacy of bivalirudin as an alternative to heparin in patients **with** HIT/HITTS requiring on pump (Koster, 2007) and off pump (Dyke, 2007) cardiac surgery.

On-Pump Trial (CHOOSE-ON): Forty-nine patients with HIT/HITTS requiring cardiac surgery (redo-CABG, single valve surgery, or CABG + single-valve surgery) were treated with bivalirudin during CPB. Patients were excluded if Cl_{cr} <30 mL/minute, dependent on dialysis, had an EF <30%, or required surgery on >1 heart valve. A bivalirudin bolus of 50 mg was added to the priming solution of the CPB circuit. The patient was administered a bivalirudin bolus of 1 mg/kg I.V., followed by a continuous infusion of 2.5 mg/kg/hour until ~15 minutes before end of CPB. Patients were considered adequately anticoagulated if the ACT was ≥2.5 times the baseline. The primary endpoint of the study was in-hospital acute procedural success (defined as absence of death, Q-wave MI, repeat coronary revascularization, or stroke). Mean ACT achieved was not reported. Twenty percent of the patients had a Cl_{cr} 30-60 mL/minute. Procedural success in hospital or at 7 days occurred in 46 (94%) of patients. Mean intraoperative and 24-hour blood loss was 575 ± 524 mL and 998 ± 595 mL, respectively. No differences in outcome were noted between patients overall versus patients with moderate renal impairment.

Off-Pump Trial (CHOOSE-OFF): Thirty-five patients with HIT/HITTS requiring off-pump coronary artery bypass (OPCAB) were treated with bivalirudin. Patients were excluded if Cl_{cr} <30 mL/minute, EF <30%, or recent stroke (within prior 6 months). A bivalirudin bolus of 0.75 mg/kg was administered to the patient upon the surgeon's request with a continuous infusion of 1.75 mg/kg/hour. The target ACT was >300 seconds. Additional boluses or infusion titration was discouraged. Mean maximum ACT post-baseline was 388.2 ± 53.2 seconds. Procedural success at 7 days/discharge occurred in 47 (92%) patients. Chest tube output within 24 hours after surgery was 936 ± 525 mL. Two patients required reexploration for persistent postoperative hemorrhage.

Hemofiltration during CPB can be used to reduce concentrations of bivalirudin at the end of the procedure if needed.

Heparin-Induced Thrombocytopenia (HIT): Because bivalirudin has no structural similarity to heparin, it may be safely administered to patients with HIT or heparin-induced thrombotic thrombocytopenia syndrome (HITTS) or a history of HIT or HITTS. The 2004 ACC/AHA guidelines for the management of patients with acute MI recommend use of bivalirudin in HIT patients. The ACC/AHA/SCAI 2005 PCI guidelines recommend bivalirudin or argatroban as a heparin alternative in patients with HIT.

Percutaneous Coronary Intervention (PCI): Compared with heparin, bivalirudin reduced the composite endpoint of death, myocardial infarction, or revascularization in patients undergoing PCI (Bittl, 2001). Bleeding complications were significantly decreased as well. REPLACE-2 is a randomized, double-blind, heparin/GP IIb/IIIa inhibitor-controlled, international trial in patients undergoing PCI. Patients requiring reperfusion for acute MI were excluded. Patients were randomized to receive I.V. bivalirudin (0.75 mg/kg bolus plus 1.75 mg/kg/hour infusion for the duration of PCI) with provisional GP IIb/IIIa inhibitor (abciximab or eptifibatide, using FDA-approved dosing) or heparin bolus (65 units/kg) and planned GP IIb/IIIa inhibitor. More than 85% of all patients received aspirin and a thienopyridine. The study composite endpoint was 30-day incidence of death, MI, refractory ischemia, or in-hospital major bleeding. The results showed that bivalirudin with provisional GP IIb/IIIa inhibitor (used in 7.2% of patients) was not inferior to heparin plus planned GP IIb/IIIa inhibitor. There were more non-Q-wave MIs, but fewer in-hospital major bleeding events in the bivalirudin group. Long-term (1 year) follow-up with bivalirudin and provisional GP IIb/IIIa blockade is comparable to that of heparin and planned GP IIb/IIIa blockade (Lincolf, 2004). The ACC/AHA/SCAI 2005 guidelines state that bivalirudin is a reasonable alternative to UFH and GPIIb/IIIa antagonists in low-risk patients undergoing elective PCI.

Anesthesia and Critical Care Concerns/Other Considerations

Heparin-induced thrombocytopenia (HIT): Because bivalirudin has no structural similarity to heparin, it may be safely administered to patients with HIT or heparin-induced thrombotic thrombocytopenia syndrome (HITTS), or a history of HIT or HITTS.

Index TermsHirulog

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Bleomycin may be confused with Cleocin®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(blee oh MYE sin)

U.S. Brand NamesBlenoxane® [DSC]

Canadian Brand NamesBlenoxane®; Bleomycin Injection, USP

Pharmacologic CategoryAntineoplastic Agent, Antibiotic

Use: Labeled IndicationsTreatment of squamous cell carcinomas, melanomas, sarcomas, testicular carcinoma, Hodgkin's lymphoma, and non-Hodgkin's lymphoma; sclerosing agent for malignant pleural effusion

Dosing: AdultsMaximum cumulative lifetime dose: 400 units; refer to individual protocols; 1 unit = 1 mg; may be administered I.M., I.V., SubQ, or intracavitary.

Test dose for lymphoma patient: I.M., I.V., SubQ: Because of the possibility of an anaphylactoid reaction, administer 1-2 units of bleomycin before the first 1-2 doses; monitor vital signs every 15 minutes; wait a minimum of 1 hour before administering remainder of dose; if no acute reaction occurs, then the regular dosage schedule may be followed. **Note:** Test doses may produce false-negative results.

Single agent therapy:

I.M./I.V./SubQ: Squamous cell carcinoma, lymphosarcoma, reticulum cell sarcoma, testicular carcinoma: 0.25-0.5 units/kg (10-20 units/m^2) 1-2 times/week

Continuous intravenous infusion: 15 units/m^2 over 24 hours/day for 4 days

Pleural sclerosing: Intrapleural: 60 units as a single instillation (some recommend limiting the dose in the elderly to 40 units/m^2; usual maximum: 60 units). Dose may be repeated at intervals of several days if fluid continues to accumulate (mix in 50-100 mL of NS); may add lidocaine 100-200 mg to reduce local discomfort.

Dosing: ElderlyRefer to adult dosing. Some recommend limiting the dose in the elderly to 40 units/m^2; usual maximum: 60 units.

Dosing: PediatricRefer to adult dosing.

Dosing: Renal Impairment

The FDA-approved labeling recommends the following adjustments:

Cl_{cr} 40-50 mL/minute: Administer 70% of normal dose

Cl_{cr} 30-40 mL/minute: Administer 60% of normal dose

Cl_{cr} 20-30 mL/minute: Administer 55% of normal dose

Cl_{cr} 10-20 mL/minute: Administer 45% of normal dose

Cl_{cr} 5-10 mL/minute: Administer 40% of normal dose

The following guidelines have been used by some clinicians:

Arnoff, 2007: Adults: Continuous renal replacement therapy (CRRT): Administer 75% of dose

Kintzel, 1995:

Cl_{cr} 46-60 mL/minute: Administer 70% of dose

Cl_{cr} 31-45 mL/minute: Administer 60% of dose

Cl_{cr} <30 mL/minute: Consider use of alternative drug

Dosing: Hepatic ImpairmentNot studied in patients with hepatic impairment; adjustment for hepatic impairment may be needed.

Dosing: Combination Regimens

Cervical cancer: BIP

Head and neck cancer: CABO

Lymphoma, Hodgkin's:

- ABVD
- BEACOPP
- CAD/MOPP/ABV
- MOPP/ABV Hybrid
- MOPP/ABVD
- Stanford V Regimen

Lymphoma, non-Hodgkin's:

- CEPP(B)
- COP-BLAM
- MACOP-B
- m-BACOD
- Pro-MACE-CytaBOM

Melanoma:

- BOLD
- BOLD + Interferon
- BOLD (Melanoma)

Osteosarcoma: POG-8651

Ovarian cancer:

- BEP (Ovarian Cancer)
- BEP (Ovarian Cancer, Testicular Cancer)

Testicular cancer:

- BEP (Ovarian Cancer, Testicular Cancer)
- BEP (Testicular Cancer)
- PVB
- VBP

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.May cause pain at injection site.

Administration: I.V.I.V. doses should be administered slowly (over 10-60 minutes).

Administration: I.V. DetailpH: 4-6 (reconstituted solution, varies depending on diluent)

Administration: Other

Intrapleural: 60 units in 50-100 mL NS; use of topical anesthetics or narcotic analgesia is usually not necessary

SubQ: May cause pain at injection site.

StorageRefrigerate intact vials of powder. Intact vials are stable for up to 1 month at 45°C. Solutions for infusion are stable for 96 hours at room temperature and 14 days under refrigeration.

ReconstitutionReconstitute powder with 1-5 mL BWFI or BNS which is stable at room temperature or under refrigeration for 28 days.

Standard I.V. dilution: Dose/50-1000 mL NS.

CompatibilityStable in NS; **variable stability (consult detailed reference)** in D_5W.

Y-site administration: Compatible: Allopurinol, amifostine, aztreonam, cefepime, cisplatin, cyclophosphamide, doxorubicin, doxorubicin liposome, droperidol, etoposide phosphate, filgrastim, fludarabine, fluorouracil, gemcitabine, granisetron, heparin, leucovorin, melphalan, methotrexate, metoclopramide, mitomycin, ondansetron, paclitaxel, piperacillin/tazobactam, sargramostim, teniposide, thiotepa, vinblastine, vincristine, vinorelbine.

Compatibility in syringe: Compatible: Cisplatin, cyclophosphamide, doxorubicin, droperidol, fluorouracil, furosemide, heparin, leucovorin, methotrexate, metoclopramide, mitomycin, vinblastine, vincristine.

Compatibility when admixed: Compatible: Amikacin, dexamethasone sodium phosphate, diphenhydramine, fluorouracil, gentamicin, heparin, hydrocortisone sodium phosphate, phenytoin, streptomycin, tobramycin, vinblastine, vincristine. **Incompatible:** Aminophylline, ascorbic acid injection, cefazolin, diazepam, hydrocortisone sodium succinate, methotrexate, mitomycin, nafcillin, penicillin G sodium, terbutaline.

ContraindicationsHypersensitivity to bleomycin or any component of the formulation; severe pulmonary disease; pregnancy
Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.
- Idiosyncratic reaction: See “Concerns related to adverse effects” below.
- Pulmonary fibrosis: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Hepatotoxicity: May cause hepatic toxicity.
- Idiosyncratic reaction: **[U.S. Boxed Warning]: A severe idiosyncratic reaction consisting of hypotension, mental confusion, fever, chills, and wheezing (similar to anaphylaxis) has been reported in 1% of lymphoma patients treated with bleomycin.** Since these reactions usually occur after the first or second dose, careful monitoring is essential after these doses.
- Pulmonary fibrosis: **[U.S. Boxed Warning]: Occurrence of pulmonary fibrosis (commonly presenting as pneumonitis) is higher in elderly patients, patients receiving >400 units total lifetime dose or single doses >30 units, smokers, and patients with prior radiation therapy or receiving concurrent oxygen.**
- Renal toxicity: May cause renal toxicity.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment, may require dose adjustment.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**
- O_2 during surgery: Use caution when administering O_2 during surgery to patients who have received bleomycin.

Geriatric ConsiderationsPulmonary toxicity has been reported more frequently in geriatric patients (>70 years of age).
Pregnancy Risk FactorD
Pregnancy ConsiderationsAnimal studies have demonstrated teratogenic and abortifacient effects. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should avoid becoming pregnant during treatment.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.
Adverse Reactions

>10%:

Dermatologic: Pain at the tumor site, phlebitis. About 50% of patients develop erythema, rash, striae, induration, hyperkeratosis, vesiculation, and peeling of the skin, particularly on the palmar and plantar surfaces of the hands and feet. Hyperpigmentation (50%), alopecia, nailbed changes may also occur. These effects appear dose related and reversible with discontinuation.

Gastrointestinal: Stomatitis and mucositis (30%), anorexia, weight loss

Respiratory: Tachypnea, rales, acute or chronic interstitial pneumonitis, and pulmonary fibrosis (5% to 10%); hypoxia and death (1%). Symptoms include cough, dyspnea, and bilateral pulmonary infiltrates. The pathogenesis is not certain, but may be due to damage of pulmonary, vascular, or connective tissue. Response to steroid therapy is variable and somewhat controversial.

Miscellaneous: Acute febrile reactions (25% to 50%)

1% to 10%:

Dermatologic: Skin thickening, diffuse scleroderma, onycholysis, pruritus

Miscellaneous: Anaphylactoid-like reactions (characterized by hypotension, confusion, fever, chills, and wheezing; onset may be immediate or delayed for several hours); idiosyncratic reactions (1% in lymphoma patients)

<1%: Angioedema, cerebrovascular accident, cerebral arteritis, hepatotoxicity, malaise, MI, nausea, Raynaud’s phenomenon, renal toxicity, scleroderma-like skin changes, thrombotic microangiopathy, vomiting; Myelosuppression (rare); Onset: 7 days, Nadir: 14 days, Recovery: 21

days

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Gemcitabine: May enhance the adverse/toxic effect of Bleomycin. The risk of pulmonary toxicity may be increased. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersPulmonary function tests (total lung volume, forced vital capacity, carbon monoxide diffusion), renal function, liver function, chest x-ray, temperature initially; check body weight at regular intervals

Nursing: Physical Assessment/MonitoringAssess pulmonary and pregnancy status prior to beginning therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions. Pulmonary status should be evaluated for fine rales prior to each treatment (may be the first symptom of pulmonary toxicity) and physician notified of any changes. Lymphoma patients should be closely monitored for 1 hour following test dose before remainder of dose is administered. Infusion or injection site must be monitored closely to avoid extravasation. Assess results of laboratory tests (pulmonary, renal, and hepatic function), therapeutic effectiveness, and adverse reactions regularly during therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsPulmonary function (total lung volume, forced vital capacity, carbon monoxide diffusion), renal function, chest x-ray, liver function

Patient EducationDo not take any new medications during treatment unless approved by physician. This medication can only be administered by injection or infusion; report immediately any redness, burning, pain, or swelling at injection/infusion site. May cause loss of appetite, nausea, or vomiting (small, frequent meals, sucking lozenges, or chewing gum may help); mouth sores (frequent mouth care with soft swabs and mouth rinses may help); fever or chills (will usually resolve); redness, peeling, or increased color of skin; or loss of hair (reversible after cessation of therapy). Report any change in respiratory status; respiratory difficulty; wheezing; air hunger; increased secretions; difficulty expectorating secretions; confusion; unresolved fever or chills; sores in mouth; vaginal itching, burning, or discharge; sudden onset of dizziness; acute headache; or burning, stinging, redness, or swelling at injection site. **Pregnancy/breast-feeding precautions:** Inform physician if you are pregnant. Do not get pregnant during or for 1 month following therapy. Consult physician for instruction on appropriate contraceptives. This drug may cause severe fetal defects. Breast-feeding is not recommended

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution, as sulfate: 15 units, 30 units

Blenoxane®: 15 units [DSC], 30 units [DSC]

Generic AvailableYes

Mechanism of ActionInhibits synthesis of DNA; binds to DNA leading to single- and double-strand breaks

Pharmacodynamics/Kinetics

Absorption: I.M. and intrapleural administration: 30% to 50% of I.V. serum concentrations; intraperitoneal and SubQ routes produce serum concentrations equal to those of I.V.

Distribution: V_d: 22 L/m^2; highest concentrations in skin, kidney, lung, heart tissues; lowest in testes and GI tract; does not cross blood-brain barrier

Protein binding: 1%

Metabolism: Via several tissues including hepatic, GI tract, skin, pulmonary, renal, and serum

Half-life elimination: Biphasic (renal function dependent):

Normal renal function: Initial: 1.3 hours; Terminal: 9 hours

End-stage renal disease: Initial: 2 hours; Terminal: 30 hours

Time to peak, serum: I.M.: Within 30 minutes

Excretion: Urine (50% to 70% as active drug)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis and mucositis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment May rarely produce myelosuppression; use caution with clozapine and carbamazepine

Anesthesia and Critical Care Concerns/Other Considerations The use of oxygen concentrations (>30%) in animals previously treated with bleomycin has been reported to promote pulmonary toxicity. Although this is still controversial, supplemental oxygen should be used judiciously in patients who have received bleomycin.

Index Terms Bleo; Bleomycin Sulfate; BLM; NSC-125066

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Bleomycin: SubQ: 7.5 units/day days 1 and 4 (cycle 1 only)

followed by SubQ: 15 units/day days 1 and 4 (subsequent cycles)

[total dose/cycle = 45 units; maximum total dose (all cycles) = 400 units]

Vincristine: I.V.: 1 mg/m^2/day days 1 and 5

[total dose/cycle = 2 mg/m^2]

Lomustine: Oral: 80 mg/m^2 (maximum 150 mg/dose) day 1

[total dose/cycle = 80 mg/m^2]

Dacarbazine: I.V.: 200 mg/m^2/day (maximum 400 mg/dose) days 1 to 5

[total dose/cycle = 1000 mg/m^2; maximum 2000 mg]

Repeat cycle every 4-6 weeks

Variation 2:

Bleomycin: I.V.: 15 units/day days 1 and 4

[total dose/cycle = 30 units]

Vincristine: I.V.: 1 mg/m^2/day days 1 and 5

[total dose/cycle = 2 mg/m^2]

Lomustine: Oral: 80 mg/m^2 (maximum 150 mg/dose) day 1

[total dose/cycle = 80 mg/m^2]

Dacarbazine: I.V.: 200 mg/m^2/day days 1 to 5

[total dose/cycle = 1000 mg/m^2]

Repeat cycle every 4 weeks

Variation 3:

Bleomycin: I.V.: 15 units/day days 1 and 4

[total dose/cycle = 30 units]

Vincristine: I.V.: 1 mg/m^2 day 1

[total dose/cycle = 1 mg/m^2]

Lomustine: Oral: 80 mg/m^2 day 3 (odd numbered cycles)

[total dose/cycle = 80 mg/m^2; every other cycle]

Dacarbazine: I.V.: 200 mg/m^2/day days 1 to 5

[total dose/cycle = 1000 mg/m^2]

Repeat cycle every 4 weeks

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Bleomycin: I.V.: 15 units/day days 2 and 5

[total dose/cycle = 30 units]

Vincristine: I.V.: 1 mg/m^2/day days 1 and 4

[total dose/cycle = 2 mg/m^2]

Lomustine: Oral: 80 mg day 1

[total dose/cycle = 80 mg]

Dacarbazine: I.V.: 200 mg/m^2/day days 1 to 5

[total dose/cycle = 1000 mg/m^2]

Interferon Alfa-2b: SubQ: 3 million units/day days 8 to 49 (cycles 1 and 2)

[total dose through day 49 = 126 million units]

followed by SubQ: 6 million units 3 times/week (beginning day 50 and subsequent cycles)

[total dose/cycle = 72 million units]

Repeat cycle every 4 weeks

Variation 2:

Bleomycin: I.V.: 30 units day 1

[total dose/cycle = 30 units]

Vincristine: I.V.: 2 mg day 1

[total dose/cycle = 2 mg]

Lomustine: Oral: 80 mg day 1

[total dose/cycle = 80 mg]

Dacarbazine: I.V.: 700 mg/m^2 day 1

[total dose/cycle = 700 mg/m^2]

Interferon Alfa-2b: SubQ: 3 million units 3 times/week

[total dose/cycle = 36 million units]

Repeat cycle every 4 weeks

Variation 3:

Bleomycin: I.V.: 15 units/day days 2 and 5

[total dose/cycle = 30 units]

Vincristine: I.V.: 1-2 mg/day days 1 and 4

[total dose/cycle = 2-4 mg]

Lomustine: Oral: 80 mg day 1

[total dose/cycle = 80 mg]

Dacarbazine: I.V.: 200 mg/m^2/day days 1 to 5

[total dose/cycle = 1000 mg/m^2]

Interferon Alfa-2b: SubQ: 6 million units 3 times/week, for 6 doses, starting day 8

[total dose/cycle = 36 million units]

Repeat cycle every 4 weeks

Variation 4:

Bleomycin: I.V.: 15 units/day days 2 and 5

[total dose/cycle = 30 units]

Vincristine: I.V.: 1 mg/m^2/day (maximum 2 mg/dose) days 1 and 4

[total dose/cycle = 2 mg/m^2]

Lomustine: Oral: 80 mg day 1

[total dose/cycle = 80 mg]

Dacarbazine: I.V.: 200 mg/m^2/day days 1 to 5

[total dose/cycle = 1000 mg/m^2]

Interferon Alfa-2b: SubQ: 3 million units/day days 8, 10, 12, 15, 17, and 19

[total dose/cycle = 18 million units]

Repeat cycle every 4 weeks

Bortezomib-Dexamethasone

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pharmacologic Category Chemotherapy Regimen, Multiple Myeloma

Regimen Use Multiple myeloma

Index Terms Dexamethasone-Bortezomib

Regimen NOTE: Multiple variations are listed below.

Variation 1:

Cycles 1 and 2:

Bortezomib: I.V.: 1.3 mg/m^2/day days 1, 4, 8, and 11

[total dose/cycle = 5.2 mg/m^2]

Dexamethasone: Oral: 40 mg/day days 1 to 4 and days 9 to 12

[total dose/cycle = 320 mg]

Treatment cycle is 21 days

Cycles 3 and 4:

Bortezomib: I.V.: 1.3 mg/m^2/day days 1, 4, 8, and 11

[total dose/cycle = 5.2 mg/m^2]

Dexamethasone: Oral: 40 mg/day days 1 to 4

[total dose/cycle = 160 mg]

Treatment cycle is 21 days

Variation 2:

Cycles 1 and 2:

Bortezomib: I.V.: 1.3 mg/m^2/day days 1, 4, 8, and 11

[total dose/cycle = 5.2 mg/m^2]

Treatment cycle is 21 days

Cycles 3 through 6 (begin dexamethasone after cycle 2 if partial response not achieved or after cycle 4 if complete response not achieved):

Bortezomib: I.V.: 1.3 mg/m^2/day days 1, 4, 8, and 11

[total dose/cycle = 5.2 mg/m^2]

Dexamethasone: Oral: 40 mg/day days 1 and 2

[total dose/cycle = 80 mg]

Treatment cycle is 21 days (for up to a total of 6 cycles)

[total dose/cycle = 480 mg]

Doxorubicin: I.V.: 9 mg/m^2/day days 1 to 4

[total dose/cycle = 36 mg/m^2]

Treatment cycle is 21 days

Cycles 2-4:

Bortezomib: I.V.: 1 mg/m^2/day days 1, 4, 8, and 11

[total dose/cycle = 4 mg/m^2]

Dexamethasone: Oral: 40 mg/day days 1 to 4

[total dose/cycle = 160 mg]

Doxorubicin: I.V.: 9 mg/m^2/day days 1 to 4

[total dose/cycle = 36 mg/m^2]

Treatment cycle is 21 days

Variation 3:

Bortezomib: I.V.: 1.3 mg/m^2/day days 1, 4, 8, and 11

[total dose/cycle = 5.2 mg/m^2]

Dexamethasone: Oral: 40 mg/day days 1 to 4

[total dose/cycle = 160 mg]

Doxorubicin: I.V.: 20 mg/m^2/day days 1 and 4

[total dose/cycle = 40 mg/m^2]

Repeat cycle every 28 days for up to 6 cycles

Regimen Use Multiple myeloma

Index Terms Melphalan-Prednisone-Bortezomib; VMP

Regimen NOTE: Multiple variations are listed below.

Variation 1:

Bortezomib: I.V.: 1.3 mg/m^2/day days 1, 4, 8, 11, 22, 25, 29, and 32

[total dose/cycle = 10.4 mg/m^2]

Melphalan: Oral: 9 mg/m^2/day days 1 to 4

[total dose/cycle = 36 mg/m^2]

Prednisone: Oral: 60 mg/m^2/day days 1 to 4

[total dose/cycle = 240 mg/m^2]

Repeat cycle every 42 days for 4 cycles

followed by

Bortezomib: I.V.: 1.3 mg/m^2/day days 1, 8, 22, and 29

[total dose/cycle = 5.2 mg/m^2]

Melphalan: Oral: 9 mg/m^2/day days 1 to 4

[total dose/cycle = 36 mg/m^2]

Prednisone: Oral: 60 mg/m^2/day days 1 to 4

[total dose/cycle = 240 mg/m^2]

Repeat cycle every 42 days for 5 cycles

Variation 2:

Bortezomib: I.V.: 1-1.3 mg/m^2/day days 1, 4, 8, 11, 22, 25, 29, and 32

[total dose/cycle = 8-10.4 mg/m^2]

Melphalan: Oral: 9 mg/m^2/day days 1 to 4

[total dose/cycle = 36 mg/m^2]

Prednisone: Oral: 60 mg/m^2/day days 1 to 4

[total dose/cycle = 240 mg/m^2]

Repeat cycle every 42 days for 4 cycles

followed by

Bortezomib: I.V.: 1-1.3 mg/m^2/day days 1, 8, 15, and 22

[total dose/cycle = 4-5.2 mg/m^2]

Melphalan: Oral: 9 mg/m^2/day days 1 to 4

[total dose/cycle = 36 mg/m^2]

Prednisone: Oral: 60 mg/m^2/day days 1 to 4

[total dose/cycle = 240 mg/m^2]

Repeat cycle every 35 days for 5 cycles

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(bore TEZ oh mib)

U.S. Brand NamesVelcade®

Canadian Brand NamesVelcade®

Pharmacologic CategoryAntineoplastic Agent; Proteasome Inhibitor

Use: Labeled IndicationsTreatment of multiple myeloma; treatment of relapsed or refractory mantle cell lymphoma

Use: Unlabeled/InvestigationalTreatment of non-Hodgkin’s lymphomas (other than mantle cell lymphoma)

Dosing: AdultsDetails concerning dosing in combination regimens should also be consulted.

Multiple myeloma (first-line therapy; in combination with melphalan and prednisone): I.V.: 1.3 mg/m^2 days 1, 4, 8, 11, 22, 25, 29, and 32 of a 42-day treatment cycle for 4 cycles, followed by 1.3 mg/m^2 days 1, 8, 22 and 29 of a 42-day treatment cycle for 5 cycles.

Relapsed multiple myeloma and mantle cell lymphoma: I.V.: 1.3 mg/m^2 twice weekly for 2 weeks on days 1, 4, 8, and 11 of a 21-day treatment cycle. Consecutive doses should be separated by at least 72 hours. Therapy extending beyond 8 cycles may be given once weekly for 4 weeks (days 1, 8, 15, and 22), followed by a 13-day rest (days 23 through 35).

Non-Hodgkin’s lymphoma, other than mantle cell (unlabeled use): I.V.: 1.3-1.5 mg/m^2 twice weekly for 2 weeks on days 1, 4, 8, and 11 of a 21-day treatment cycle.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment necessary. **Note:** Dialysis may reduce bortezomib concentrations; administer postdialysis.

Dosing: Hepatic ImpairmentSpecific guidelines are not available; clearance may be decreased; monitor closely for toxicity.

Dosing: Adjustment for Toxicity

Myeloma (first-line therapy):

Platelets should be ≥70,000/mm^3, ANC should be ≥1000/mm^3, and nonhematologic toxicities should resolve to grade 1 or baseline prior to therapy initiation.

Platelets ≤30,000/mm^3 or ANC <750/mm^3 on bortezomib day(s): Withhold bortezomib; if several consecutive bortezomib doses are withheld, reduce dose 1 level (1.3 mg/m^2/dose reduced to 1 mg/m^2/dose; 1 mg/m^2/dose reduced to 0.7 mg/m^2/dose)

Grade ≥3 nonhematological toxicity (other than neuropathy): Withhold bortezomib until toxicity resolves to grade 1 or baseline. May reinitiate bortezomib at 1 dose level reduction (1.3 mg/m^2/dose reduced to 1 mg/m^2/dose; 1 mg/m^2/dose reduced to 0.7 mg/m^2/dose).

Neuropathic pain and/or peripheral sensory neuropathy: See "Neuropathic pain and/or peripheral sensory neuropathy" toxicity adjustment guidelines below.

Relapsed multiple myeloma and mantle cell lymphoma:

Grade 3 nonhematological (excluding neuropathy) or Grade 4 hematological toxicity: Withhold until toxicity resolved; may reinitiate with a 25% dose reduction (1.3 mg/m^2/dose reduced to 1 mg/m^2/dose; 1 mg/m^2/dose reduced to 0.7 mg/m^2/dose)

Neuropathic pain and/or peripheral sensory neuropathy:

Grade 1 without pain or loss of function: No action needed

Grade 1 with pain or Grade 2 interfering with function but not activities of daily living: Reduce dose to 1 mg/m^2

Grade 2 with pain or Grade 3 interfering with activities of daily living: Withhold until toxicity resolved, may reinitiate at 0.7 mg/m^2 once weekly

Grade 4: Discontinue therapy

Dosing: Combination Regimens

Multiple myeloma:

Bortezomib-Dexamethasone

Bortezomib-Doxorubicin-Dexamethasone

Bortezomib-Doxorubicin (Liposomal)

Bortezomib-Doxorubicin (Liposomal)-Dexamethasone

Bortezomib-Melphalan-Prednisone

Bortezomib-Melphalan-Prednisone-Thalidomide

Calculations

- Body Surface Area: Adults

Administration: I.V.Administer via rapid I.V. push (3-5 seconds).
Administration: I.V. DetailpH: 2-6.5
StoragePrior to reconstitution, store at room temperature of 25°C (77°F); excursions permitted between 15°C to 30°C (59°F to 86°F). Protect from light. Once reconstituted, although the manufacturer recommends use within 8 hours, solution may be stored at room temperature for up to 3 days, or under refrigeration for up to 5 days, in vial or syringe (Andre, 2005). Protect from light.
ReconstitutionDilute each 3.5 mg vial with 3.5 mL NS to a final concentration of 1 mg/mL. Use appropriate precautions for handling and disposal.
ContraindicationsHypersensitivity to bortezomib, boron, mannitol, or any component of the formulation
Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Hematologic toxicity, including neutropenia and severe thrombocytopenia may occur; risk is increased in patients with pretreatment platelet counts <75,000/µL; frequent monitoring is required throughout treatment; may require dosage adjustments; withhold treatment for platelets <25,000/µL. Hemorrhage (gastrointestinal and intracerebral) due to low platelet count has been observed.

- Cardiovascular effects: May cause hypotension (including postural and orthostatic); use caution with dehydration, history of syncope, or medications associated with hypotension. Has been associated with the development or exacerbation of congestive heart failure and decreased left ventricular ejection fraction; use caution in patients with risk factors or existing heart disease. Has also been associated with QT_c prolongation.

- Hepatotoxicity: Acute liver failure has been reported (rarely) in patients receiving multiple concomitant medications; hepatitis, transaminase increases, and hyperbilirubinemia have also been reported. Use caution in patients with hepatic dysfunction; toxicities may be increased.

- Herpes reactivation: Herpes (zoster and simplex) reactivation has been reported with bortezomib; consider antiviral prophylaxis during therapy.

- Peripheral neuropathy: May cause peripheral neuropathy (usually sensory but may be mixed sensorimotor); risk may be increased with previous use of neurotoxic agents or pre-existing peripheral neuropathy; adjustment of dose and schedule may be required.

- Pulmonary toxicity: Pulmonary disorders including pneumonitis, interstitial pneumonia, lung infiltrates, and acute respiratory distress syndrome (ARDS) have been reported. Pulmonary hypertension (without left heart failure or significant pulmonary disease) has been reported rarely.

- Reversible posterior leukoencephalopathy syndrome (RPLS): Has been reported (rarely). Symptoms of RPLS include confusion, headache, hypertension, lethargy, seizure, blindness and/or other vision, or neurologic disturbances; discontinue if RPLS occurs. The safety of reinitiating bortezomib in patients previously experiencing RPLS is unknown.

- Tumor lysis syndrome: May cause tumor lysis syndrome; risk is increased in patients with high tumor burden prior to treatment

Disease-related concerns:

- Diabetes: Hyper-and hypoglycemia may occur in diabetic patients receiving oral hypoglycemics; monitor; may require adjustment of diabetes medications.

- Hepatic impairment: Use with caution in patients with hepatic impairment; clearance may be reduced; monitor for toxicity.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorD
Pregnancy ConsiderationsAdverse effects (fetal loss and decreased fetal weight) were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Effective contraception is recommended for women of childbearing potential.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.
Adverse Reactions

>10%:

Cardiovascular: Edema (11% to 28%), hypotension (12% to 15%; grades 3/4: 3%)

Central nervous system: Fever (19% to 37%), psychiatric disturbance (35%), headache (17% to 26%), dysesthesia (9% to 27%), insomnia (18%

to 21%), dizziness (14% to 23%; excludes vertigo), anxiety (5% to 11%)

Dermatologic: Rash (17% to 28%), pruritus (11%)

Endocrine & metabolic: Dehydration (7% to 11%)

Gastrointestinal: Diarrhea (47% to 57%), nausea (44% to 57%), constipation (40% to 50%), anorexia (34% to 39%), vomiting (27% to 35%), abdominal pain (14% to 16%), abnormal taste (13%), dyspepsia (13%)

Hematologic: Thrombocytopenia (21% to 38%; grade 4: 4% to 5%; nadir: day 11; recovery: by day 21), anemia (17% to 30%; grade 4: <1%), neutropenia (6% to 19%; grade 4: 2% to 3%; nadir: day 11; recovery: by day 21)

Neuromuscular & skeletal: Weakness (61% to 72%; grades 3/4: 12% to 19%), peripheral neuropathy (36% to 55%; grade 3: 7% to 11%; grade 4: <1%), paresthesia (9% to 27%), arthralgia (13% to 18%), limb pain (5% to 17%), bone pain (2% to 16%), back pain (<1 % to 15%), myalgia (10% to 12%), muscle cramps (5% to 12%), rigors (11%)

Ocular: Blurred vision (11%)

Respiratory: Dyspnea (20% to 23%), cough (19% to 21%), lower respiratory infection (15%), upper respiratory tract infection (11% to 15%), nasopharyngitis (8% to 14%), pneumonia (9% to 12%)

Miscellaneous: Herpesvirus infections (7% to 13%)

1% to 10%:

Cardiovascular: Syncope (2%)

Endocrine & metabolic: Hypercalcemia (grade 4: 2%)

Frequency not defined (including postmarketing and/or case reports; limited to important or life-threatening): Acute diffuse infiltrative pulmonary disease, acute respiratory distress syndrome, alkaline phosphatase increased, allergic reaction, amyloidosis, anaphylaxis, angina, angioedema, ascites, aspergillosis, atelectasis, atrial fibrillation, atrial flutter, AV block, bacteremia, bradycardia, cardiac amyloidosis, cardiac arrest, cardiac tamponade, cardiogenic shock, cardiopulmonary arrest, cerebral hemorrhage, cerebrovascular accident, CHF, cholestasis, coma, complete heart block, confusion, cranial palsy, deafness, deep venous thrombosis, diplopia, disseminated intravascular coagulation (DIC), duodenitis (hemorrhagic), dysautonomia, dysphagia, edema (facial), encephalopathy, embolism, epistaxis, fecal impaction, fracture, gastritis (hemorrhagic), gastroenteritis, GGT increased, glomerular nephritis, hematemesis, hematuria, hemoptysis, hemorrhagic cystitis, hepatic failure, hepatic hemorrhage, hepatitis, hepatocellular damage, herpes meningoencephalitis, hyperbilirubinemia, hyper-/hypoglycemia, hyper-/hypokalemia, hyper-/hyponatremia, hypersensitivity, hyperuricemia, hypocalcemia, hypoxia, immune complex hypersensitivity, injection site reaction, intestinal obstruction, intestinal perforation, intracerebral hemorrhage, ischemic colitis, ischemic stroke, laryngeal edema, leukocytoclastic vasculitis, leukopenia, listeriosis, lymphopenia, melena, mental status change, MI, myocardial ischemia, neuralgia, neutropenic fever, ophthalmic herpes, oral candidiasis, pancreatitis, paralytic ileus, paraplegia, pericardial effusion, pericarditis, peritonitis, pleural effusion, pneumonia, pneumonitis, portal vein thrombosis, proliferative glomerular nephritis, psychosis, pulmonary alveolar hemorrhage, pulmonary edema, pulmonary embolism, pulmonary hypertension, psychosis, QT_c prolongation, renal calculus, renal failure, respiratory failure, respiratory insufficiency, reversible posterior leukoencephalopathy syndrome (RPLS), seizure, septic shock, sepsis, sinus arrest, spinal cord compression, stomatitis, stroke (hemorrhagic), stroke, subarachnoid hemorrhage, subdural hematoma, suicidal ideation, tachycardia, torsade de pointes, toxic epidermal necrolysis, toxoplasmosis, transaminases increased, transient ischemic attack, tumor lysis syndrome, urinary incontinence, urinary retention, urinary tract infection, urticaria, ventricular tachycardia

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2C9 (minor), 2C19 (major), 2D6 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2C19 (moderate), 2D6 (weak), 3A4 (weak)

Drug Interactions

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid St John's wort (may decrease bortezomib levels).

Monitoring ParametersSigns/symptoms of peripheral neuropathy, dehydration, or hypotension; CBC with differential and platelets (monitor frequently throughout therapy); renal function, pulmonary function (with new or worsening pulmonary symptoms), liver function tests (in patients with existing hepatic impairment)

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, effectiveness of therapy, and adverse reactions on regular basis during therapy (eg, peripheral neuropathy, postural hypotension, dehydration, congestive heart failure, infections). Monitor for psychiatric disturbances. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelets (monitor frequently throughout therapy); liver function tests (in patients with existing hepatic impairment)

Patient EducationDo not take any new medication during therapy without consulting prescriber. This medication can only be administered intravenously; you will be monitored during and following infusion. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause headache, dizziness (use caution when changing positions), anxiety, sleep disturbances, fever, or fatigue (use caution when driving or engaging in hazardous tasks until response to drug is known); nausea, vomiting, loss of appetite, or abnormal taste (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation; or diarrhea (boiled milk, yogurt, or buttermilk may help). You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). Report immediately any chest pain, respiratory difficulty, itching, rash, acute headache, throat tightness, pain, redness, or swelling at infusion site. Report swelling in extremities, recent weight gain (>3-5 pounds/week), persistent headache; muscle, bone, or back pain; abdominal pain; cramping or loss of sensation or tingling of extremities; unusual bleeding; changes in vision; psychiatric disturbances; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant or cause a pregnancy (males) during therapy or for 1 month following therapy. Consult prescriber for instructions on appropriate nonhormonal contraceptive measures. This drug may cause fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Velcade®: 3.5 mg [contains mannitol 35 mg]

Generic AvailableNo

ManufacturerMillennium (Takeda Oncology Co)

Mechanism of ActionBortezomib inhibits proteasomes, enzyme complexes which regulate protein homeostasis within the cell. Specifically, it reversibly inhibits chymotrypsin-like activity at the 26S proteasome, leading to activation of signaling cascades, cell-cycle arrest, and apoptosis.

Pharmacodynamics/Kinetics

Distribution: 498-1884 L/m^2

Protein binding: ~83%

Metabolism: Hepatic primarily via CYP2C19 and 3A4 and to a lesser extent CYP1A2; forms metabolites (inactive) via deboronization followed by hydroxylation

Half-life elimination: Single dose: 9-15 hours; multiple dosing: 1 mg/m^2: 40-193 hours; 1.3 mg/m^2: 76-108 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Abnormal taste and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia, dizziness, and anxiety are common; may cause agitation, confusion, psychosis, and suicidal ideation

Mental Health: Effects on Psychiatric TreatmentGastrointestinal side effects are common; use caution with SSRIs. May cause neutropenia and thrombocytopenia; use caution with clozapine, carbamazepine, and valproic acid. Fluoxetine, fluvoxamine, and nefazodone may increase bortezomib serum levels, while carbamazepine and barbiturates may decrease its serum levels.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Tracleer® may be confused with TriCor©

Pronunciation(boe SEN tan)

U.S. Brand NamesTracleer®

Canadian Brand NamesTracleer®

Pharmacologic CategoryEndothelin Antagonist; Vasodilator

Use: Labeled IndicationsTreatment of pulmonary artery hypertension (PAH) (WHO Group I) in patients with World Health Organization (WHO) Class III or IV symptoms to improve exercise capacity and decrease the rate of clinical deterioration

Dosing: AdultsPulmonary artery hypertension: Oral: Initial: 62.5 mg twice daily for 4 weeks; increase to maintenance dose of 125 mg twice daily; adults <40 kg should be maintained at 62.5 mg twice daily. Doses >125 mg twice daily do not appear to confer additional clinical benefit but may increase risk of liver toxicity.

Note: When discontinuing treatment, consider a reduction in dosage to 62.5 mg twice daily for 3-7 days (to avoid clinical deterioration).

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricPulmonary artery hypertension:

Children ≤12 years (unlabeled use):

10-20 kg: Initial: 31.25 mg once daily for 4 weeks; increase to maintenance dose of 31.25 mg twice daily

>20-40 kg: Initial: 31.25 mg twice daily for 4 weeks; increase to maintenance dose of 62.5 mg twice daily

>40 kg: Initial: 62.5 mg twice daily for 4 weeks; increase to maintenance dose of 125 mg twice daily

Adolescents >12 years and ≥40 kg: Refer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment required.

Dosing: Hepatic ImpairmentAvoid use in patients with **pretreatment** moderate to severe hepatic insufficiency.

Modification based on transaminase elevation:

If any elevation, regardless of degree, is accompanied by clinical symptoms of hepatic injury (unusual fatigue, nausea, vomiting, abdominal pain, fever, or jaundice) or a serum bilirubin ≥2 times the upper limit of normal, treatment should be stopped.

AST/ALT >3 times but ≤5 times upper limit of normal: Confirm with additional test; if confirmed, reduce dose or interrupt treatment. Monitor transaminase levels at least every 2 weeks. May continue or reintroduce treatment, as appropriate, following return to pretreatment values. Begin with initial dose (above) and recheck transaminases within 3 days

AST/ALT >5 times but ≤8 times upper limit of normal: Confirm with additional test; if confirmed, stop treatment. Monitor transaminase levels at least every 2 weeks. May reintroduce treatment, as appropriate, at starting dose, following return to pretreatment values. Recheck within 3 days and thereafter following reinitiation.

AST/ALT >8 times upper limit of normal: Stop treatment and do not reintroduce.

Administration: OralMay be administered with or without food, once in the morning and once in the evening. Women of childbearing potential should avoid excessive handling broken tablets.

Dietary ConsiderationsMay be taken with or without food. Avoid grapefruit and grapefruit juice.

StorageStore at 15°C to 30°C (59°F to 86°F).

Extemporaneously PreparedUse a commercial pill cutter to prepare a 31.25 mg dose from the 62.5 mg tablet. Half-cut 62.5 mg tablets are stable for up to 4 weeks, when stored at room temperature in the high-density polyethylene plastic bottle provided by the manufacturer of the drug.

Women of childbearing potential should avoid exposure to dust generated from broken or split tablets, especially if repeated exposure is expected.

Suspension preparation: Dissolve the 62.5 mg tablet in 10-20 mL water. Tablets will disintegrate rapidly without crushing (within ~5 minutes); stirring will accelerate disintegration. Bosentan should not be mixed or dissolved in liquids with an acidic pH (eg, fruit juices) due to poor solubility; the drug is most soluble in solutions with a pH >8.5. Bosentan is soluble in water, and sediment will form quickly when left to rest. Homogeneity of suspension cannot be assured; therefore, the manufacturer emphasizes that division of the dose by volume of suspension may not be particularly accurate.

Restrictions Bosentan (Tracleer®) is available only through a limited distribution program directly from the manufacturer (Actelion Pharmaceuticals 1-866-228-3546). It will not be available through wholesalers or individual pharmacies. An FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

Contraindications Hypersensitivity to bosentan or any component of the formulation; concurrent use of cyclosporine or glyburide; pregnancy

Warnings/Precautions

Boxed Warnings:

- Hepatic effects: See “Concerns related to adverse effects” below.
- Pregnancy: See “Special populations” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Fluid retention: May cause fluid retention evidenced by signs and symptoms of peripheral edema, weight gain, and heart failure.
- Hepatic effects: **[U.S. Boxed Warning]:Has been associated with a high incidence (12%) of significant transaminase elevations, and rare cases of unexplained hepatic cirrhosis have occurred, including after long-term therapy.** Transaminase elevations are dose dependent, generally asymptomatic, occur both early and late in therapy, progress slowly, and are usually reversible after treatment interruption or discontinuation. Avoid use in moderate-to-severe hepatic impairment or patients with elevated serum transaminases (>3 times upper limit of normal) at baseline. Monitor hepatic function closely (at least monthly) for the duration of treatment. Treatment should be stopped in patients who develop elevated transaminases (ALT or AST) in combination with symptoms of hepatic injury (unusual fatigue, jaundice, nausea, vomiting, abdominal pain, and/or fever) or elevated serum bilirubin ≥2 times upper limit of normal. Safety of reintroduction is unknown.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with ischemic cardiovascular disease.
- Low hemoglobin: Use with caution in patients with low hemoglobin levels; may cause dose-related decreases in hemoglobin and hematocrit (monitoring of hemoglobin is recommended).
- Pulmonary veno-occlusive disease (PVOD): Discontinue in any patient with pulmonary edema suggestive of pulmonary veno-occlusive disease (PVOD).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children ≤12 years of age.
- Pregnancy: **[U.S. Boxed Warning]: Use in pregnancy is contraindicated;** exclude pregnancy prior to initiation of therapy and shipment of each monthly refill. Efficacy of hormonal contraceptive may be decreased, and should not be the sole contraceptive method in patients receiving bosentan. A missed menses should be reported to healthcare provider and prompt immediate pregnancy testing. Women of childbearing potential should avoid excessive handling of broken tablets.

Pregnancy Risk Factor X

Pregnancy Considerations **[U.S. Boxed Warning]: Use in pregnancy is contraindicated.** Based on animal studies, bosentan is likely to produce major birth defects if used by pregnant women. Pregnancy must be excluded prior to initiation of therapy and follow-up pregnancy tests should be obtained monthly. Effective contraception must be maintained throughout treatment. Hormonal contraception is not recommended as the sole contraceptive therapy due to a potential lack of efficacy in patients receiving bosentan. Women of childbearing potential should avoid exposure to dust generated from broken or split tablets, especially if repeated exposure is expected (tablet splitting is currently outside of product labeling). Irreversible testicular atrophy and decreased fertility in males was observed in animal studies with long-term exposure.

Lactation Excretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Central nervous system: Headache (16% to 22%)

Hematologic: Hemoglobin decreased (≥1 g/dL in up to 57%; <11 g/dL: 3% to 6%; typically in first 6 weeks of therapy)

Hepatic: Transaminases increased (>3 times upper limit of normal; up to 12%; dose-related)

Respiratory: Nasopharyngitis (11%)

1% to 10%:

Cardiovascular: Flushing (7% to 9%), edema (lower limb, 5% to 8%; generalized 4%), hypotension (7%), palpitation (5%)

Central nervous system: Fatigue (4%)

Dermatologic: Pruritus (4%)

Gastrointestinal: Dyspepsia (4%)

Hematologic: Anemia (3%)

Hepatic: Abnormal hepatic function (6% to 8%)

<1%, postmarketing, and/or case reports: Angioneurotic edema, heart failure (exacerbation), cirrhosis (prolonged therapy), hyperbilirubinemia, hypersensitivity, leukocytoclastic vasculitis, liver failure (rare), peripheral edema, rash, thrombocytopenia, weight gain

Metabolism/Transport Effects**Substrate** (major) of CYP2C9, 3A4; **Induces** CYP2C9 (strong), 3A4 (strong)

Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Bosentan. *Risk C: Monitor therapy*

CycloSPORINE: May increase the serum concentration of Bosentan. Bosentan may decrease the serum concentration of CycloSPORINE. *Risk X: Avoid combination*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inducers (Highly Effective) may increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

GlyBURIDE: May enhance the hepatotoxic effect of Bosentan. GlyBURIDE may increase the metabolism of Bosentan. Bosentan may increase the metabolism of GlyBURIDE. *Risk X: Avoid combination*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Bosentan may increase the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Pravastatin; Rosuvastatin. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Sildenafil: Bosentan may increase the metabolism of Sildenafil. Sildenafil may increase the serum concentration of Bosentan. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Bosentan may increase the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Bioavailability of bosentan is not affected by food.

Herb/Nutraceutical: Avoid St John's wort (may decrease serum concentrations of bosentan).

Monitoring ParametersSerum transaminase (AST and ALT) and bilirubin should be determined prior to the initiation of therapy and at monthly intervals thereafter. Monitor for clinical signs and symptoms of liver injury (eg, abdominal pain, fatigue, fever, jaundice, nausea, vomiting).

A woman of childbearing potential must have a negative pregnancy test prior to the initiation of therapy and monthly thereafter (prior to shipment of monthly refill). Hemoglobin and hematocrit should be measured at baseline, at 1 month and 3 months of treatment, and every 3 months thereafter (generally stabilizes after 4-12 weeks of treatment).

Monitor for clinical signs and symptoms of liver injury.

Nursing: Physical Assessment/MonitoringAssess interactions with other prescription, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions on a regular basis during therapy. Assess for fluid retention. Instruct patient on appropriate use, side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that female patient is not pregnant prior to beginning therapy and monthly during therapy. Do not give to a female patient of childbearing age unless patient is capable of adhering to specific contraceptive measures during therapy. Instruct patient in appropriate contraceptive measures.

Monitoring: Lab TestsSerum transaminase (AST and ALT) and bilirubin should be determined prior to the initiation of therapy and at monthly intervals thereafter. A woman of childbearing potential must have a negative pregnancy test prior to the initiation of therapy and monthly thereafter (prior to shipment of each refill). Hemoglobin and hematocrit should be measured at baseline, at 1 month and 3 months of treatment, and every 3 months thereafter (generally stabilizes after 4-12 weeks of treatment).

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, with or without food. You will need frequent laboratory tests to determine effectiveness of this medication. You may experience headache (consult prescriber for approved analgesic); or GI upset (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report persistent headache or GI problems, swelling of extremities, or unusual weight gain (>5 lb/week); runny nose or persistent signs of a cold, increased shortness of breath; chest pain or palpitations; unusual fatigue or weakness; yellowing of skin or eyes; change in color of stool or urine; or other persistent reactions. **Pregnancy/breast-feeding precautions:** Female patients must have a negative pregnancy test prior to beginning therapy. This drug may cause severe fetal abnormalities. Any delay of menses or other suspicion of pregnancy should be reported to prescriber immediately. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Tracleer®: 62.5 mg, 125 mg

Generic AvailableNo

ManufacturerActelion

Mechanism of ActionBlocks endothelin receptors on vascular endothelium and smooth muscle. Stimulation of these receptors is associated with vasoconstriction. Although bosentan blocks both ET_A and ET_B receptors, the affinity is higher for the A subtype. Improvement in symptoms of pulmonary artery hypertension and a decrease in the rate of clinical deterioration have been demonstrated in clinical trials.

Pharmacodynamics/Kinetics

Distribution: V_d: 18 L

Protein binding, plasma: >98% primarily to albumin

Metabolism: Hepatic via CYP2C9 and 3A4 to three primary metabolites (one contributing ~10% to 20% pharmacologic activity)

Bioavailability: 50%

Half-life elimination: 5 hours; prolonged with heart failure, possibly in PAH

Time to peak, plasma: 3-5 hours

Excretion: Feces (as metabolites); urine (<3% as unchanged drug)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Endothelin antagonists have caused bleeding gums; there have been no specific reports for bosentan

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentCarbamazepine, other anticonvulsants, and St John's wort may decrease the effects of bosentan. Conversely, nefazodone may increase the effects of bosentan.

Jump To Field (Select Field Name)

Pronunciation(BOT yoo lin num pen ta VAY lent [aye, bee, cee, dee, ee] TOKS oyd)
Pharmacologic CategoryToxoid
Use: Unlabeled/InvestigationalInvestigational: Prophylaxis for *C. botulinum* exposure (high-risk research laboratory personnel actively working with, or expect to work with, known cultures and purified botulinum toxin)
Dosing: AdultsDo not inject intracutaneously or into superficial structures.

Initial vaccination series: 0.5 mL deep SubQ at 0-, 2-, and 12 weeks

First booster: 0.5 mL deep SubQ 12 months after first injection of the initial series

Subsequent boosters: 0.5 mL deep SubQ at 2-year intervals based on antitoxin titers as checked by CDC

Dosing: ElderlyRefer to adult dosing.
Adverse ReactionsModerate-to-severe effects (initial series 5.6%, booster 12.3%, systemic 4.5% initial & booster)

Central nervous system: Fever, headache

Dermatologic: Rash

Local: Pain/soreness at injection site

Neuromuscular & skeletal: Muscle pain

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.
Pharmacotherapy PearlsEach vial contains 0.022% formaldehyde and 1:10,000 thimerosal as a preservative; manufactured by Michigan Biologic Products Institute, Lansing, Michigan, 48909.

Special Alerts

Botulinum Types A and B: Reports of Serious Adverse Events Including Fatalities - Updated March 2008

The U.S. Food and Drug Administration (FDA) and Health Canada have issued respective early communications to healthcare professionals alerting them of serious adverse events (including fatalities) in association with the use of botulinum types A (Botox®, Botox® Cosmetic) and type B (Myobloc®). Events reported are suggestive of botulism, indicating systemic spread of the botulinum toxin beyond the site of injection. Reactions were observed in both adult and pediatric patients treated for a variety of conditions with varying doses. However, the most serious outcomes, including respiratory failure and death, were associated with the use in children for cerebral palsy limb spasticity. In the U.S., the use of botulinum toxins for the treatment of limb spasticity or the use in children <12 years of age (for any condition) is **not** approved by the FDA. In Canada, botulinum toxin type A **is** approved for the treatment of limb spasticity in adults and pediatric patients who are ≥2 years of age. Botulinum toxin type B at this time is not marketed in Canada.

Presently, the warnings sections of botulinum toxins types A and B product labeling indicate that severe dysphagia and dyspnea have occurred after local injection of typical doses of botulinum toxin in patients afflicted with neuromuscular diseases. The FDA has evaluated postmarketing cases and now reports that systemic and potentially fatal toxicity may result from local injection of the botulinum toxins in the treatment of other underlying conditions such as cerebral palsy associated with limb spasticity. There have been no reports of systemic toxin spread in Canada.

The FDA and Health Canada continue to evaluate safety data regarding these reports. In the interim, healthcare professionals are reminded to be aware of the potency differences between the botulinum products; use for approved indications only; monitor patients closely for signs/symptoms of systemic toxic effects (possibly occurring 1 day to several weeks after treatment); and instruct patients to seek immediate medical attention with worsening symptoms or dysphagia, dyspnea, muscle weakness, or difficulty speaking.

Additional information can be found at:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#botox

http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_32_e.html

Pronunciation(BOT yoo lin num TOKS in type aye)

U.S. Brand NamesBotox®; Botox® Cosmetic

Canadian Brand NamesBotox®; Botox® Cosmetic

Pharmacologic CategoryNeuromuscular Blocker Agent, Toxin; Ophthalmic Agent, Toxin

Use: Labeled IndicationsTreatment of strabismus and blepharospasm associated with dystonia (including benign essential blepharospasm or VII nerve disorders) in patients ≥12 years of age; cervical dystonia (spasmodic torticollis) in patients ≥16 years of age; temporary improvement in the appearance of lines/wrinkles of the face (moderate to severe glabellar lines associated with corrugator and/or procerus muscle activity) in adult patients ≤65 years of age; treatment of severe primary axillary hyperhidrosis in adults not adequately controlled with topical treatments

Canadian labeling: Additional use (not in U.S. labeling): Focal spasticity, including treatment of stroke related upper limb spasticity; dynamic equines foot deformity in pediatric cerebral palsy patients

Use: Unlabeled/InvestigationalTreatment of oromandibular dystonia, spasmodic dysphonia (laryngeal dystonia) and other dystonias (ie, writer's cramp, focal task-specific dystonias); migraine treatment and prophylaxis; treatment of dynamic muscle contracture in pediatric cerebral palsy patients

Dosing: Adults

Cervical dystonia: I.M.: For dosing guidance, the mean dose is 236 units (25th to 75th percentile range 198-300 units) divided among the affected muscles in patients previously treated with botulinum toxin. Initial dose in previously untreated patients should be lower. Sequential dosing should be based on the patient's head and neck position, localization of pain, muscle hypertrophy, patient response, and previous adverse reactions. The total dose injected into the sternocleidomastoid muscles should be ≤100 units to decrease the occurrence of dysphagia.

Canadian labeling (not in U.S. labeling): Effective range of 200-360 units has been used in clinical practice; maximum dose: 6 units/kg every 2 months

Blepharospasm: I.M.: Initial dose: 1.25-2.5 units injected into the medial and lateral pretarsal orbicularis oculi of the upper lid and lateral pretarsal orbicularis oculi of lower lid; dose may be increased up to twice the previous dose if the response from the initial dose lasted ≤2 months; maximum dose per site: 5 units. Tolerance may occur if treatments are given more often than every 3 months, but the effect is not usually permanent. Cumulative dose:

U.S. labeling: ≤200 units in 30-day period

Canadian labeling (not in U.S. labeling): ≤200 units in 60-day period

Spasticity (focal):*Canadian labeling (not approved in U.S. labeling):* I.M.: Individualize dose based on patient size, extent, and location of muscle involvement, degree of spasticity, local muscle weakness, and response to prior treatment. In clinical trials total doses up to 360 units were administered as separate injections typically divided among flexor muscles of the elbow, wrist, and fingers; may repeat therapy at 3-4 months with appropriate dosage based upon the clinical condition of patient at time of retreatment.

Suggested guidelines for the treatment of stroke-related upper limb spasticity: **Note:** Dose listed is total dose administered as individual or separate intramuscular injection(s):

Biceps brachii: 100-200 units (up to 4 sites)

Flexor digitorum profundus: 15-50 units (1-2 sites)

Flexor digitorum sublimes: 15-50 units (1-2 sites)

Flexor carpi radialis: 15-60 units (1-2 sites)

Flexor carpi ulnaris: 10-50 units (1-2 sites)

Adductor pollicis: 20 units (1-2 sites)

Flexor pollicis longus: 20 units (1-2 sites)

Strabismus: I.M.: **Note:** Several minutes prior to injection, administration of local anesthetic and ocular decongestant drops are recommended.

Initial dose:

Vertical muscles and for horizontal strabismus <20 prism diopters: 1.25-2.5 units in any one muscle

Horizontal strabismus of 20-50 prism diopters: 2.5-5 units in any one muscle

Persistent VI nerve palsy ≥1 month: 1.25-2.5 units in the medial rectus muscle

Re-examine patients 7-14 days after each injection to assess the effect of that dose. Subsequent doses for patients experiencing incomplete paralysis of the target may be increased up to twice the previous administered dose. The maximum recommended dose as a single injection for any one muscle is 25 units. Do not administer subsequent injections until the effects of the previous dose are gone.

Primary axillary hyperhidrosis: Intradermal: 50 units/axilla. Injection area should be defined by standard staining techniques. Injections should be evenly distributed into multiple sites (10-15), administered in 0.1-0.2 mL aliquots, ~1-2 cm apart. May repeat when clinical effect diminishes.

Reduction of glabellar lines: Adults ≤65 years: I.M.: An effective dose is determined by gross observation of the patient's ability to activate the superficial muscles injected. The location, size and use of muscles may vary markedly among individuals. Inject 0.1 mL (4 units) dose into each of five sites, two in each corrugator muscle and one in the procerus muscle for a total dose 0.5 mL (20 units) administered no more frequently than every 3-4 months.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Blepharospasm/strabismus: Children ≥12 years: Refer to adult dosing.

Cervical dystonia: Children ≥16 years: Refer to adult dosing.

Spasticity (cerebral palsy related):*Canadian labeling (not approved in U.S. labeling):* Children ≥2 years: I.M.: 4 units/kg (total dose) divided into two injections into medial and lateral heads of the gastrocnemius of affected limb; if clinically indicated, may repeat every 2 months (maximum dose: 200 units)

Dosing: Renal ImpairmentNo adjustment is recommended.

Dosing: Hepatic ImpairmentNo adjustment necessary.

Administration: I.M.

Cervical dystonia: Use 25-, 27-, or 30-gauge needle for superficial muscles and a longer 22-gauge needle for deeper musculature; electromyography may help localize the involved muscles.

Blepharospasm: Use a 27- or 30-gauge needle without electromyography guidance. Avoid injecting near the levator palpebrae superioris (may decrease ptosis); avoid medial lower lid injections (may decrease diplopia). Apply pressure at the injection site to prevent ecchymosis in the soft eyelid tissues.

Spasticity (cerebral palsy related; Canadian labeling [not in U.S. labeling]): Use a 23 to 26-gauge needle for administration into the medial and lateral heads of the gastrocnemius muscle of the affected limb.

Spasticity (focal; Canadian labeling [not in U.S. labeling]): Use a 25, 27, or 30-gauge needle for superficial muscles and a longer 22-gauge needle for deeper musculature; electromyography or nerve stimulation may help localize the involved muscles.

Strabismus injections: Must use surgical exposure or electromyographic guidance; use the electrical activity recorded from the tip of the injections needle as a guide to placement within the target muscle. Local anesthetic and ocular decongestant should be given before injection. The volume of injection should be 0.05-0.15 mL per muscle. Many patients will require additional doses because of inadequate response to initial dose.

Reduction of glabellar lines (Botox® Cosmetic): Use a 30-gauge needle. Ensure injected volume/dose is accurate and where feasible keep to a minimum. Avoid injection near the levator palpebrae superioris. Medial corrugator injections should be at least 1 cm above the bony supraorbital ridge. Do not inject toxin closer than 1 cm above the central eyebrow.

Administration: OtherPrimary axillary hyperhidrosis: Inject each dose intradermally to a depth of ~2 mm and at a 45° angle. Do not inject directly into areas marked in ink (to avoid permanent tattoo effect). Prior to administration, injection area should be defined by standard staining techniques such as Minor's Iodine-Starch Test.

Instructions for Minor's Iodine-Starch Test: Patient should shave underarms and refrain from using deodorants or antiperspirants for 24 hours prior to test. At 30 minutes prior to test, patient should be at rest, no exercise, and not consume hot beverages. Underarm area should be dried and immediately painted with iodine solution. After area dries, lightly sprinkle with starch powder. Gently blow off excess powder. A deep blue-black color will develop over the hyperhidrotic area in ~10 minutes.

StorageStore undiluted vials under refrigeration at 2°C to 8°C for up to 24 months (Botox® Cosmetic) or up to 36 months (Botox®). After reconstitution, store in refrigerator (2°C to 8°C) and use within 4 hours (does not contain preservative).

ReconstitutionReconstitute with sterile, preservative free 0.9% sodium chloride.

Botox®: Reconstitute vials with 1 mL of diluent to obtain concentration of 10 units per 0.1 mL; 2 mL of diluent to obtain concentration of 5 units per 0.1 mL; 4 mL of diluent to obtain concentration of 2.5 units per 0.1 mL; 8 mL of diluent to obtain concentration of 1.25 units per 0.1 mL.

Botox® Cosmetic: Reconstitute vials with 2.5 mL of diluent to obtain concentration of 4 units per 0.1 mL (20 units per 0.5 mL).

ContraindicationsHypersensitivity to albumin, botulinum toxin, or any component of the formulation; infection at the proposed injection site(s)

Canadian labeling: Additional contraindications (not in U.S. labeling): Myasthenia gravis or Eaton-Lambert syndrome

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions may occur rarely; immediate treatment (including epinephrine 1:1000) should be available.
- Antibody formation: Higher doses or more frequent administration may result in neutralizing antibody formation and loss of efficacy.
- Cardiovascular events: Rarely, arrhythmia and myocardial infarction have been reported, sometimes in patients with preexisting cardiovascular disease.
- Dysphagia: Common when used for cervical dystonia and may persist anywhere from 2 weeks up to 5 months after administration. Risk of upper respiratory infection may be increased and, in severe cases, patients may require alternative feeding methods. Risk factors include smaller neck muscle mass, bilateral injections into the sternocleidomastoid muscle, or injections into the levator scapulae.

Disease-related concerns:

- Neuromuscular disease: Use with caution in patients with neuromuscular diseases such as myasthenia gravis or Eaton-Lambert syndrome (contraindicated in Canadian labeling) and neuropathic disorders (such as amyotrophic lateral sclerosis).
- Ocular diseases: Reduced blinking from injection of the orbicularis muscle can lead to corneal exposure and ulceration when treating blepharospasm. Retrobulbar hemorrhages may occur from needle penetration into orbit when treating strabismus; spatial disorientation, double vision, or past pointing may occur if one or more extraocular muscles are paralyzed. Covering the affected eye may help. Careful testing of corneal sensation, avoidance of lower lid injections, and treatment of epithelial defects are necessary. Use caution in patients with angle closure glaucoma.

Concurrent drug therapy issues:

- Neuromuscular transmission: Use with extreme caution in patients receiving other agents that may interfere with neuromuscular transmission (eg, aminoglycosides, neuromuscular-blocking agents)

Dosage form specific issues:

- Albumin: Product contains albumin and may carry a remote risk of virus transmission.

Other warnings/precautions:

- Chronic therapy: Long-term effects of chronic therapy unknown.
- Injection site: Use with caution if there is excessive weakness or atrophy at the proposed injection site(s); use is contraindicated if infection is present.
- Primary axillary hyperhidrosis: Appropriate use: Evaluate for secondary causes prior to treatment (eg, hyperthyroidism). Safety and efficacy for treatment of hyperhidrosis in other areas of the body have not been established.
- Temporary reduction in glabellar lines: Appropriate use: Do not use more frequently than every 3 months. Patients with marked facial asymmetry, ptosis, excessive dermatochalasis, deep dermal scarring, thick sebaceous skin, or the inability to substantially lessen glabellar lines by physically spreading them apart were excluded from clinical trials. Reduced blinking from injection of the orbicularis muscle can lead to corneal exposure and ulceration. Spatial disorientation, double vision, or past pointing may occur if one or more extraocular muscles are paralyzed.

Geriatric ConsiderationsNo specific dosing adjustment recommended.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDecreased fetal body weight, delayed ossification, maternal toxicity, abortions, and fetal malformations were observed in animal studies. Human reproduction studies have not been conducted. Avoid use in pregnancy. Based on limited case reports, adverse fetal effects have not been observed with inadvertent administration during pregnancy. It is currently recommended to ensure adequate contraception in women of childbearing potential.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsAdverse effects usually occur in 1 week and may last up to several months

>10%:

Cervical dystonia:

Central nervous system: Pain (32%), headache (up to 11%)

Gastrointestinal: Dysphagia (19%)

Neuromuscular & skeletal: Focal weakness (17%), neck pain (11%)

Respiratory: Upper respiratory infection (12%)

Other indications (blepharospasm, primary axillary hyperhidrosis, strabismus):

Neuromuscular & skeletal: Primary axillary hyperhidrosis (3% to 10%)

Ocular: Ptosis (blepharospasm 21%; strabismus 1% to 38%), vertical deviation (strabismus 17%)

2% to 10%:

Cervical dystonia:

Central nervous system: Dizziness, drowsiness, fever, malaise, speech disorder

Gastrointestinal: Nausea, xerostomia

Local: Injection site reaction: Soreness

Neuromuscular & skeletal: Back pain, hypertonia, weakness, stiffness

Respiratory: Cough, rhinitis

Miscellaneous: Flu-like syndrome

Cerebral palsy spasticity:

Central nervous system: Pain (1% to 2%), fever (1%), lethargy (1%)

Neuromuscular & skeletal: Falling, weakness

Focal spasticity:

Central nervous system: Arm pain (1% to 3%)

Dermatologic: Bruising (1% to 3%)

Local: Injection site reactions: burning, pain (1% to 3%)

Neuromuscular & skeletal: Hypertonia (1% to 3%), weakness (1% to 3%)

Other indications (blepharospasm, primary axillary hyperhidrosis, reduction of glabellar lines, strabismus):

Central nervous system: Anxiety, dizziness

Dermatologic: Pruritus

Gastrointestinal: Nausea

Local: Injection site reaction: Soreness

Neuromuscular & skeletal: Back pain, facial pain, weakness

Ocular: Irritation/tearing (includes dry eye, lagophthalmos, photophobia); ptosis, superficial punctate keratitis

Respiratory: Pharyngitis

Miscellaneous: Flu-like syndrome, infection, nonaxillary sweating

<2%, postmarketing, and/or case reports:*Any indication:* Abdominal pain, acute angle closure glaucoma, allergic reactions, anaphylaxis, ankle pain, anterior segment eye ischemia, appetite decreased, arrhythmia, arthralgia, aspiration pneumonia, blurred vision, brachial plexopathy, bruising, ciliary ganglion damage, corneal perforation, dermatitis, diaphoresis, diarrhea, diplopia, dyspepsia, dysphonia, dyspnea, ectropion, entropion, erythema multiforme, eyelid edema, facial weakness, focal facial paralysis, glaucoma, hearing loss, hypoesthesia, hypertension, knee pain, leg cramps, lethargy, malaise, MI, myalgia, myasthenia gravis exacerbation, neutralizing antibody formation, numbness, pneumonia, pruritus, psoriasiform eruption, ptosis, rash, reduced blinking leading to corneal ulceration, retinal vein occlusion, retrobulbar hemorrhage, seizure, skin tightness, syncope, tooth disorder, urticaria, vertigo with nystagmus, vitreous hemorrhage, vomiting

Drug Interactions

Aminoglycosides: May enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Botulinum Toxin Type A may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: May enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringUse with caution in presence of disease that affects neuromuscular transmission or coagulation. Prior to administration, assess potential for interactions with other medications patient may be taking (eg, anything that may affect neuromuscular transmission). See specific Dosing and Administration instructions according to purpose for use. Assess therapeutic effects and adverse response following each treatment (systemic toxic effects may occur 1 day to several weeks after treatment). Teach patient about necessary aftercare, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis medication is administered by injection. Follow aftercare instructions exactly. When used to improve appearance of lines/wrinkles in face: May cause headache; dry, painful, watery, or bloodshot eyes; a feeling of something in the eye; increased sensitivity to light; or slightly blurred vision. Other uses: May cause headache, dizziness, drowsiness (use caution when driving or engaged in tasks that require alertness until response to drug is known), gastrointestinal upset, neck pain, upper respiratory infection, sore throat, or rhinitis. Report immediately difficulty swallowing, breathing, or speaking; muscle weakness; worsening symptoms; or other persistent or acute adverse symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]: *Clostridium botulinum* toxin type A 100 units [contains human albumin]

Generic AvailableNo

ManufacturerAllergan, Inc

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Botox)

100 unit (1): $609.98

Mechanism of ActionBotulinum A toxin is a neurotoxin produced by *Clostridium botulinum*, spore-forming anaerobic bacillus, which appears to affect only the presynaptic membrane of the neuromuscular junction in humans, where it prevents calcium-dependent release of acetylcholine and produces a state of denervation. Muscle inactivation persists until new fibrils grow from the nerve and form junction plates on new areas of the muscle-cell walls. Intradermal injection results in temporary sweat gland denervation, reducing local sweating.

Pharmacodynamics/Kinetics

Onset of action (improvement):

Blepharospasm: ~3 days

Cervical dystonia: ~2 weeks

Reduction of glabellar lines (Botox® Cosmetic): 1-2 days, increasing in intensity during first week

Spasticity (focal and cerebral palsy related): <2 weeks

Strabismus: ~1-2 days

Duration:

Blepharospasm: ~3 months

Cervical dystonia: <3 months

Primary axillary hyperhidrosis: 201 days (mean)

Reduction of glabellar lines (Botox® Cosmetic): ~3-4 months

Spasticity (cerebral palsy related): ~3-3.5 months

Strabismus: ~2-6 weeks

Absorption: Not expected to be present in peripheral blood at recommended doses following intramuscular (I.M.) injection

Time to peak:

Blepharospasm: 1-2 weeks

Cervical dystonia: ~6 weeks

Spasticity (focal): 4-6 weeks

Strabismus: Within first week

Pharmacotherapy PearlsUnits of biological activity of Botox® cannot be compared with units of any other botulinum toxin.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes

upon discontinuation), facial pain, and facial weakness. Affects occur in ~1 week and may last up to several months.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Special Alerts

Botulinum Types A and B: Reports of Serious Adverse Events Including Fatalities - Updated March 2008

The U.S. Food and Drug Administration (FDA) and Health Canada have issued respective early communications to healthcare professionals alerting them of serious adverse events (including fatalities) in association with the use of botulinum types A (Botox®, Botox® Cosmetic) and type B (Myobloc®). Events reported are suggestive of botulism, indicating systemic spread of the botulinum toxin beyond the site of injection. Reactions were observed in both adult and pediatric patients treated for a variety of conditions with varying doses. However, the most serious outcomes, including respiratory failure and death, were associated with the use in children for cerebral palsy limb spasticity. In the U.S., the use of botulinum toxins for the treatment of limb spasticity or the use in children <12 years of age (for any condition) is **not** approved by the FDA. In Canada, botulinum toxin type A **is** approved for the treatment of limb spasticity in adults and pediatric patients who are ≥2 years of age. Botulinum toxin type B at this time is not marketed in Canada.

Presently, the warnings sections of botulinum toxins types A and B product labeling indicate that severe dysphagia and dyspnea have occurred after local injection of typical doses of botulinum toxin in patients afflicted with neuromuscular diseases. The FDA has evaluated postmarketing cases and now reports that systemic and potentially fatal toxicity may result from local injection of the botulinum toxins in the treatment of other underlying conditions such as cerebral palsy associated with limb spasticity. There have been no reports of systemic toxin spread in Canada.

The FDA and Health Canada continue to evaluate safety data regarding these reports. In the interim, healthcare professionals are reminded to be aware of the potency differences between the botulinum products; use for approved indications only; monitor patients closely for signs/symptoms of systemic toxic effects (possibly occurring 1 day to several weeks after treatment); and instruct patients to seek immediate medical attention with worsening symptoms or dysphagia, dyspnea, muscle weakness, or difficulty speaking.

Additional information can be found at:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#botox

http://www.hc-sc.gc.ca/ahc-asc/media/advisories-avis/_2008/2008_32_e.html

Pronunciation(BOT yoo lin num TOKS in type bee)

U.S. Brand NamesMyobloc®

Pharmacologic CategoryNeuromuscular Blocker Agent, Toxin

Use: Labeled IndicationsTreatment of cervical dystonia (spasmodic torticollis)

Use: Unlabeled/InvestigationalTreatment of cervical dystonia in patients who have developed resistance to botulinum toxin type A

Dosing: AdultsCervical dystonia: I.M.: Initial: 2500-5000 units divided among the affected muscles in patients **previously treated** with botulinum toxin; initial dose in **previously untreated** patients should be lower. Subsequent dosing should be optimized according to patient's response.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricNot established in pediatric patients

Dosing: Renal ImpairmentNo adjustment is recommended.

Dosing: Hepatic ImpairmentNo adjustment necessary.

StorageStore vials under refrigeration at 2°C to 8°C (36°F to 46°F) for up to 21 months. Once diluted, use within 4 hours. Does not contain preservative. Single use vial. Do not freeze.

ReconstitutionMay be diluted with normal saline. Do not shake.

CompatibilityDo not mix with any other medicines.

ContraindicationsHypersensitivity to albumin, botulinum toxin, or any component of the formulation; infection at the injection site(s). Relative contraindications include diseases of neuromuscular transmission; coagulopathy, including therapeutic anticoagulation; inability of patient to cooperate.

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions may occur; immediate treatment (including epinephrine 1:1000) should be available.
- Antibody formation: Higher doses or more frequent administration may result in neutralizing antibody formation and loss of efficacy.
- Dysphagia: Common when used for cervical dystonia. It may be severe requiring alternative feeding methods. Risk factors include smaller neck muscle mass, bilateral injections into the sternocleidomastoid muscle, or injections into the levator scapulae.

Dysphasia may be associated with increased risk of upper respiratory infection.

Disease-related concerns:

- Neuromuscular disease: Use with caution in patients with neuromuscular diseases (such as myasthenia gravis), neuropathic disorders (such as amyotrophic lateral sclerosis), or patients taking aminoglycosides or other drugs that interfere with neuromuscular transmission.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Albumin: Product contains albumin and may carry a remote risk of virus transmission.

Other warnings/precautions:

- Appropriate use: Concurrent use of botulinum toxin type A or within <4 months of type B is not recommended.
- Chronic therapy: Long-term effects of chronic therapy unknown.
- Injection site: Use with caution if there is inflammation, excessive weakness, or atrophy at the proposed injection site(s).

Geriatric ConsiderationsNo dosage adjustments required, but limited experience in patients ≥75 years of age.

Pregnancy Risk FactorC (manufacturer)

Pregnancy ConsiderationsReproduction studies have not been conducted. Based on limited case reports using botulinum toxin A, adverse fetal effects have not been observed with inadvertent administration during pregnancy. It is currently recommended to ensure adequate contraception in women of childbearing years.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Headache (10% to 16%), pain (6% to 13%; placebo 10%)

Gastrointestinal: Dysphagia (10% to 25%), xerostomia (3% to 34%)

Local: Injection site pain (12% to 16%)

Neuromuscular & skeletal: Neck pain (up to 17%; placebo: 16%)

Miscellaneous: Infection (13% to 19%; placebo: 15%)

1% to 10%:

Cardiovascular: Chest pain, vasodilation, peripheral edema

Central nervous system: Dizziness (3% to 6%), fever, malaise, migraine, anxiety, tremor, hyperesthesia, somnolence, confusion, vertigo

Dermatologic: Pruritus, bruising

Gastrointestinal: Nausea (3% to 10%; placebo: 5%), dyspepsia (up to 10%; placebo: 5%), vomiting, stomatitis, taste perversion

Genitourinary: Urinary tract infection, cystitis, vaginal moniliasis

Hematologic: Serum neutralizing activity

Neuromuscular & skeletal: Torticollis (up to 8%; placebo: 7%), arthralgia (up to 7%; placebo: 5%), back pain (3% to 7%; placebo: 3%), myasthenia (3% to 6%; placebo: 3%), weakness (up to 6%; placebo: 4%), arthritis

Ocular: Amblyopia, abnormal vision

Otic: Otitis media, tinnitus

Respiratory: Cough (3% to 7%; placebo: 3%), rhinitis (1% to 5%; placebo: 6%), dyspnea, pneumonia

Miscellaneous: Flu-syndrome (6% to 9%), allergic reaction, viral infection, abscess, cyst

Drug Interactions

Aminoglycosides: May enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Botulinum Toxin Type A: May enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: May enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringUse with caution in presence of disease that affects neuromuscular transmission or coagulation. Prior to administration, assess potential for interactions with other medications patient may be taking (eg, anything that may affect neuromuscular transmission). See specific Dosing and Administration instructions according to purpose for use. Assess therapeutic effects and adverse response following each treatment (systemic toxic effects may occur 1 day to several weeks after treatment). Teach patient about necessary aftercare, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis medication is administered by injection. Follow aftercare instructions exactly. When used to improve appearance of lines/wrinkles in face: May cause headache; dry, painful, watery, or bloodshot eyes; a feeling of something in the eye; increased sensitivity to light; or slightly blurred vision. Other uses: May cause headache, dizziness, drowsiness (use caution when driving or engaged in tasks that require alertness until response to drug is known), gastrointestinal upset, neck pain, upper respiratory infection, sore throat, or rhinitis. Report immediately difficulty swallowing, breathing, or speaking; muscle weakness; worsening symptoms; or other persistent or acute adverse symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Myobloc®: 5000 units/mL (0.5 mL, 1 mL, 2 mL) [contains albumin 0.05%]

Generic AvailableNo

ManufacturerElan Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Solution (Myobloc)

10000 units/2 mL (2): $1003.30

Mechanism of ActionBotulinum B toxin is a neurotoxin produced by *Clostridium botulinum*, spore-forming anaerobic bacillus. It cleaves synaptic Vesicle Association Membrane Protein (VAMP; synaptobrevin) which is a component of the protein complex responsible for docking and fusion of the synaptic vesicle to the presynaptic membrane. By blocking neurotransmitter release, botulinum B toxin paralyzes the muscle.

Pharmacodynamics/Kinetics

Duration: 12-16 weeks

Absorption: Not expected to be present in peripheral blood at recommended doses

Pharmacotherapy PearlsUnits of biological activity of Myobloc® cannot be compared with units of any other botulinum toxin.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), stomatitis, and abnormal taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, dizziness, sedation, or confusion

Mental Health: Effects on Psychiatric TreatmentMay cause torticollis, use atypical antipsychotics with caution; may cause flu-like syndrome (take this into consideration if also concerned about SSRI discontinuation syndrome)

Anesthesia and Critical Care Concerns/Other ConsiderationsUnits of biological activity of Myobloc® cannot be compared with units of any other botulinum toxin.

Botulism Immune Globulin (Intravenous-Human)

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

BabyBIG® may be confused with HBIG

Pronunciation(BOT yoo lism i MYUN GLOB you lin, in tra VEE nus, YU man)
U.S. Brand NamesBabyBIG®
Pharmacologic CategoryImmune Globulin
Use: Labeled IndicationsTreatment of infant botulism caused by toxin type A or B
Dosing: PediatricInfant botulism: Children <1 year: I.V.: 1 mL/kg (50 mg/kg) as a single dose; infuse at 0.5 mL/kg/hour (25 mg/kg/hour) for the first 15 minutes. If well tolerated, may increase to 1 mL/kg/hour (50 mg/kg/hour).
Administration: I.V.For I.V. infusion only. Do not administer if solution is turbid. Epinephrine should be available for the treatment of acute allergic reaction. Administer using low volume tubing and infusion pump with an in-line or syringe tip 18 µm filter. Infuse at 0.5 mL/kg/hour (25 mg/kg/hour) for the first 15 minutes; if well tolerated, may increase to 1 mL/kg/hour (50 mg/kg/hour). Infusion should take ~67.5 minutes. Infusion should be slowed or temporarily interrupted for minor side effects; discontinue in case of hypotension or anaphylaxis.
StoragePrior to reconstitution, store between 2°C to 8°C (35.6°F to 46.4°F). Infusion should begin within 2 hours of reconstitution and be completed within 4 hours of reconstitution.
ReconstitutionReconstitute with SWFI 2 mL. Swirl gently to wet powder; do not shake. Powder should dissolve in ~30 minutes.
CompatibilityAdministration with other medications is not recommended. If necessary, may be piggybacked into an existing I.V. line containing NS or the following dextrose solutions with or without sodium chloride: $D_{2.5}W$, D_5W, $D_{20}W$; do not dilute more than 1:2.
RestrictionsAvailable from the California Department of Health
ContraindicationsHypersensitivity to human immune globulin preparations or any component of the formulation; selective immunoglobulin A deficiency
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions can occur; immediate treatment (including epinephrine 1:1000) should be available.
- Aseptic meningitis: Aseptic meningitis syndrome (AMS) has been reported with intravenous immune globulin administration (rare); may occur with high doses (≥2 g/kg).
- Renal impairment: Acute renal dysfunction (increased serum creatinine, oliguria, acute renal failure) can rarely occur; usually within 7 days of use (more likely with products stabilized with sucrose). Use with caution in the elderly, patients with renal disease, diabetes mellitus, volume depletion, sepsis, paraproteinemia, and nephrotoxic medications due to risk of renal dysfunction. In patients at risk of renal dysfunction, the rate of infusion and concentration of solution should be minimized. discontinue if renal function deteriorates.

Disease-related concerns:

- Hypovolemia: Patients should not be volume depleted prior to therapy.

Special populations:

- Adults: Not indicated for use in adults.
- Pediatrics: Safety and efficacy established for infants <1 year of age; not indicated for children ≥ 1 year of age.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

Other warnings/precautions:

- Administration: For I.V. infusion only; do not exceed recommended rate of administration.

Pregnancy ConsiderationsReproduction studies have not been conducted.
Adverse ReactionsPercentages reported in open-label study except where otherwise noted; may reflect pathophysiology of infant botulism.

>10%:

Cardiovascular: Blood pressure increased (transient, 75%), pallor (28%), edema (18%), blood pressure decreased (transient, 16%); cardiac murmur (15%)

Central nervous system: Irritability (41%), pyrexia (17%), body temperature decreased (16%)

Dermatologic: Contact dermatitis (24%), erythematous rash (22%, reported as 14% vs 8% in placebo-controlled study)

Gastrointestinal: Dysphagia (65%), loose stools (25%), vomiting (20%), abdominal distension (11%)

Otic: Otitis media (11%, reported in placebo-controlled study)

Respiratory: Atelectasis (39%), rhonchi (34%), nasal congestion (18%), oxygen saturation decreased (17%), cough (13%), rales (13%)

1% to 10%:

Cardiovascular: Tachycardia (7%), peripheral coldness (7%)

Central nervous system: Agitation (10%)

Endocrine & metabolic: Dehydration (10%), hyponatremia (6%), metabolic acidosis (5%)

Hematologic: Hemoglobin decreased (9%), anemia (5%)

Local: Injection site reaction (7%), injection site erythema (5%)

Renal: Neurogenic bladder

Respiratory: Breath sounds decreased (10%), stridor (9%), lower respiratory tract infection (8%), dyspnea (6%), tachypnea (5%)

Miscellaneous: Oral candidiasis (8%), intubation (5%), infusion rate reactions (<5%, includes chills, back pain, fever, muscle cramps, nausea, vomiting, wheezing)

Drug Interactions

Vaccines (Live): Immune Globulins may diminish the therapeutic effect of Vaccines (Live). **Exceptions:** Influenza Virus Vaccine; Yellow Fever Vaccine. *Risk D: Consider therapy modification*

Monitoring ParametersRenal function (BUN, serum creatinine, urinary output); vital signs (continuously during infusion); aseptic meningitis syndrome (may occur hours to days following IGIV therapy); signs of relapse (may occur up to 1 month following recovery)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

BabyBIG®: ~100 mg [contains albumin and sucrose; packaged with SWFI]

Generic AvailableNo

Mechanism of ActionBIG-IV is purified immunoglobulin derived from the plasma of adults immunized with botulinum toxoid types A and B. BIG-IV provides antibodies to neutralize circulating toxins.

Pharmacodynamics/Kinetics

Duration: Protective neutralizing antibody levels: 6 months

Half-life elimination: 28 days

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral candidiasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusIrritability is common; may cause agitation

Mental Health: Effects on Psychiatric TreatmentRash is common; be mindful if patient is also receiving lamotrigine. GI side effects are common; concomitant use with SSRIs, lithium, or valproic acid may produce additive effects.

Medication Safety Issues

International issues:

Combigan® may be confused with Combivent® which is a brand name for ipratropium/albuterol in the U.S.; may be confused with Comtan® which is a brand name for entacapone in the U.S.

Pronunciation(bri MOE ni deen & TIM oh lol)

U.S. Brand NamesCombigan™

Canadian Brand NamesCombigan®

Pharmacologic CategoryAlpha$_2$ Agonist, Ophthalmic; Beta Blocker, Nonselective; Ophthalmic Agent, Antiglaucoma

Use: Labeled IndicationsReduction of intraocular pressure (IOP) in patients with glaucoma or ocular hypertension

Dosing: AdultsGlaucoma, ocular hypertension: Ophthalmic: Instill 1 drop into affected eye(s) twice daily

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricGlaucoma, ocular hypertension: Children ≥2 years: Ophthalmic: Instill 1 drop into affected eye(s) twice daily

Note: In the Canadian labeling, use in children (at any age) is not recommended

Administration: OtherAdminister approximately every 12 hours. Remove contact lenses prior to administration; wait 15 minutes before reinserting if using products containing benzalkonium chloride. Separate administration of other ophthalmic agents by 5-10 minutes.

StorageStore at 15°C to 25°C (59°F to 77°F). Protect from light.

Contraindications

Hypersensitivity to brimonidine, timolol, or any other component of the formulation; current or history of bronchial asthma, severe chronic obstructive pulmonary disease (COPD); sinus bradycardia, second- or third-degree atrioventricular block, overt cardiac failure, cardiogenic shock. Also see individual agents.

Canadian labeling: Additional contraindications (not in U.S. labeling): Monoamine oxidase (MAO) inhibitor therapy (concurrent or within 14 days)

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to a variety of allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.
- Bacterial keratitis: Inadvertent contamination of multiple-dose ophthalmic solutions has the potential to cause bacterial keratitis.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Ocular effects: Use of agents that reduce/suppress aqueous humor production has been associated with choroidal detachment after filtration procedures. Discontinue use in patients with chronic or recurrent choroidal detachment.
- Orthostatic hypotension: Use with caution. Signs and symptoms of hypotension may be enhanced.

Disease-related concerns:

- Angle-closure glaucoma: Appropriate use: Not for use alone to treat acute angle-closure glaucoma (has no effect on papillary constriction).
- Bronchospastic disease: In general, patients with bronchospastic disease (eg, asthma, COPD) should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.
- Conduction abnormalities: Consider pre-existing conditions such as sick sinus syndrome before initiating.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.
- Heart failure: Use with caution in patients with compensated heart failure and monitor for a worsening of the condition.
- Hepatic impairment: Use with caution in patients with hepatic impairment; not studied.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; may worsen myasthenia-related muscle weakness.
- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

- Renal Impairment: Use with caution in patients with renal impairment; not studied.
- Thyrotoxicosis: Signs of hyperthyroidism (eg, tachycardia) may be masked by beta-blockers. Avoid abrupt withdrawal if thyrotoxicosis is suspected (may precipitate thyroid storm).
- Vascular disease: Use with caution in patients with cerebral/coronary insufficiency as well as peripheral vascular disease (including Raynaud's, thromboangiitis obliterans).

Special populations:

- Contact lens wearers: Product contains benzalkonium chloride which may be absorbed by soft contact lenses; remove lens prior to administration and wait 15 minutes before reinserting.
- Pediatrics: Safety and efficacy have not been established in children <2 years of age; use in children <2 years of age is not recommended. **Note:** In the Canadian labeling, use in children (at any age) is not recommended. Serious adverse reactions (eg, bradycardia, hypotension, apnea, dyspnea, cyanosis) resulting in hospitalization have been reported in association with brimonidine administration in infants ages 28 days to 3 months.

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.
- Absorption: Systemic absorption and adverse effects may occur with ophthalmic use, including bradycardia and/or hypotension.
- General anesthesia: Use with caution in patients undergoing general anesthesia; severe hypotension, difficulty in restarting/maintaining heartbeat and/or impaired ability of the heart to respond to stimuli may occur; withdrawal of beta-blockade prior to elective surgery may be advised.

Also see individual agents.

Pregnancy Risk FactorC

Pregnancy Considerations There are no adequate and well-controlled studies in pregnant women with the combination product. Use only if benefit outweighs risk. Also see individual agents.

LactationEnters breast milk (timolol)/not recommended

Breast-Feeding ConsiderationsTimolol has been detected in human breast milk following ophthalmic administration. It is not known if brimonidine is excreted in human milk.

Adverse ReactionsPercentages as reported with combination product. Also see individual agents.

>10%: Ocular: Conjunctival hyperemia (15%), burning sensation (11%)

1% to 10%:

Cardiovascular: Hypertension

Central nervous system: Somnolence (2%; children 25% to 83%), headache (1%), depression

Gastrointestinal: Xerostomia (2%)

Neuromuscular & skeletal: Weakness (2%)

Ocular: Stinging (6%), pruritus (6%), allergic conjunctivitis (5%), conjunctival folliculosis (5%), blurred vision (4%), blepharitis (3%), corneal erosion (3%), dry eyes (3%), epiphora (3%), eye discharge (3%), eyelid edema (3%), eyelid erythema (3%), superficial punctuate keratitis (3%), eye pain (2%), foreign body sensation (1%), eye irritation, eyelid pruritus

<1%: Conjunctival edema, follicular conjunctivitis

Metabolism/Transport EffectsTimolol: **Substrate** of CYP2D6 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Alpha2-Agonists (Ophthalmic). *Risk X: Avoid combination*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Monitoring ParametersIntraocular pressure; monitor for systemic effect of beta-blockade with ophthalmic administration; blood pressure
Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian availability

Solution, ophthalmic [drops]:

Combigan™: Brimonidine tartrate 0.2% and timolol maleate 0.5% (5 mL,10 mL) [contains benzalkonium chloride]

Combigan® [CAN]: Brimonidine tartrate 0.2% and timolol maleate 0.5% (2.5 mL, 5 mL,10 mL) [contains benzalkonium chloride]

Generic AvailableNo
ManufacturerAllergan, Inc
Pricing: U.S. (www.drugstore.com)

Solution (Combigan)

0.2-0.5% (5): $67.99

Mechanism of Action

Brimonidine: Selective agonism for alpha$_2$-receptors; causes reduction of aqueous humor formation and increased uveoscleral outflow

Timolol: Blocks both beta$_1$- and beta$_2$-adrenergic receptors, reduces intraocular pressure by reducing aqueous humor production or possibly outflow; reduces blood pressure by blocking adrenergic receptors and decreasing sympathetic outflow, produces a negative chronotropic and inotropic activity by blocking beta$_1$-adrenergic receptors

Pharmacodynamics/KineticsSee individual agents.

Index TermsBrimonidine Tartrate and Timolol Maleate; Timolol and Brimonidine

Medication Safety Issues

Sound-alike/look-alike issues:

Brimonidine may be confused with bromocriptine

Pronunciation(bri MOE ni deen)
U.S. Brand NamesAlphagan® P
Canadian Brand NamesAlphagan®; Apo-Brimonidine®; PMS-Brimonidine Tartrate; ratio-Brimonidine; Sandoz-Brimonidine
Pharmacologic CategoryAlpha$_2$ Agonist, Ophthalmic; Ophthalmic Agent, Antiglaucoma
Use: Labeled IndicationsLowering of intraocular pressure (IOP) in patients with open-angle glaucoma or ocular hypertension
Dosing: AdultsGlaucoma: Ophthalmic: Instill 1 drop in affected eye(s) 3 times/day (approximately every 8 hours)
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren ≥2 years of age: Refer to adult dosing.
Administration: OtherRemove contact lenses prior to administration; wait 15 minutes before reinserting if using products containing benzalkonium chloride. Separate administration of other ophthalmic agents by 5 minutes.
StorageStore between 15°C to 25°C (59°F to 77°F).
ContraindicationsHypersensitivity to brimonidine tartrate or any component of the formulation; during or within 14 days of MAO inhibitor therapy
Allergy Considerations

- Brimonidine Allergy

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.
- Cerebrovascular insufficiency: Use with caution in patients with cerebral insufficiency.
- Depression: Use with caution in patients with depression.
- Orthostatic hypotension: Use with caution in patients with orthostatic hypotension.
- Raynaud's phenomenon: Use with caution in patients with Raynaud's phenomenon.
- Thromboangiitis obliterans: Use with caution in patients with thromboangiitis obliterans.

Special populations:

- Contact lens wearers: Contains benzalkonium chloride which may be adsorbed by contact lenses; remove contacts prior to administration and wait 15 minutes before reinserting.
- Pediatrics: Safety and efficacy have not been established in children <2 years of age. Systemic absorption has been reported; children are at higher risk of systemic adverse events.

Other warnings/precautions:

- Monitoring efficacy: The IOP-lowering efficacy observed during the first month of therapy may not always reflect the long-term level of IOP reduction; routinely monitor IOP.

Geriatric ConsiderationsAssess patient's ability to self-administer eye drops.
Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsActual frequency of adverse reactions may be formulation dependent; percentages reported with Alphagan® P:

>10%:

Central nervous system: Somnolence (adults 1% to 4%; children 25% to 83%)

Ocular: Allergic conjunctivitis, conjunctival hyperemia, eye pruritus

1% to 10% (unless otherwise noted 1% to 4%):

Cardiovascular: Hypertension (5% to 9%), hypotension

Central nervous system: Alertness decreased (children), dizziness, fatigue, headache, insomnia

Dermatologic: Rash

Endocrine & metabolic: Hypercholesterolemia

Gastrointestinal: Xerostomia (5% to 9%), dyspepsia

Neuromuscular & skeletal: Weakness

Ocular: Burning sensation (5% to 9%), conjunctival folliculosis (5% to 9%), ocular allergic reaction (5% to 9%), visual disturbance (5% to 9%), blepharitis, blepharoconjunctivitis, blurred vision, cataract, conjunctival edema, conjunctival hemorrhage, conjunctivitis, dry eye, epiphora, eye discharge, eyelid disorder, eyelid edema, eyelid erythema, follicular conjunctivitis, foreign body sensation, irritation, keratitis, pain, photophobia, stinging, superficial punctate keratopathy, visual acuity worsened, visual field defect, vitreous detachment, vitreous floaters, watery eyes

Respiratory: Bronchitis, cough, dyspnea, pharyngitis, rhinitis, sinus infection, sinusitis

Miscellaneous: Allergic reaction, flu-like syndrome, infection

<1%: Corneal erosion, hordeolum, nasal dryness, taste perversion

Postmarketing and/or case reports: Anterior uveitis, bradycardia, depression, iritis, keratoconjunctivitis sicca, miosis, nausea, skin reactions (erythema, eyelid pruritus, vasodilation), tachycardia; apnea, bradycardia, hypothermia, and hypotonia have been reported in infants

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Alpha2-Agonists (Ophthalmic). *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid herbs with **hypertensive** properties (bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng, gotu kola, licorice); may diminish antihypertensive effect. Avoid herbs with **hypotensive** properties (black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse); may enhance hypotensive effect.

Monitoring ParametersClosely monitor patients who develop fatigue or drowsiness; IOP

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Monitor intraocular pressure periodically. Assess therapeutic response and adverse effects. Teach patient proper use, side effects/appropriate interventions, and symptoms to report.

Patient EducationFor use in eyes only. Wash hands before instilling. Remove contacts prior to administration and wait 15 minutes before reinserting. Sit or lie down to instill. Open eye, look at ceiling, and instill prescribed amount of solution. Apply gentle pressure to inner corner of eye. Do not let tip of applicator touch eyes; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Brimonidine tartrate may cause fatigue or drowsiness in some patients. Avoid engaging in hazardous activities due to potential for decreased mental alertness. Wait at least 15 minutes after instilling brimonidine tartrate before reinserting soft contact lenses. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic, as tartrate: 0.2% (5 mL, 10 mL, 15 mL) [may contain benzalkonium chloride]

Alphagan® P: 0.1% (5 mL, 10 mL, 15 mL) [contains Purite® as preservative]; 0.15% (5 mL, 10 mL, 15 mL) [contains Purite® as preservative]

Generic AvailableYes

ManufacturerAllergan, Inc

Pricing: U.S. (www.drugstore.com)

Solution (Alphagan P)

0.1% (15): $175.47

0.15% (5): $63.12

0.15% (10): $115.55

0.15% (15): $167.98

Solution (Brimonidine Tartrate)

0.2% (5): $31.99

0.2% (10): $51.99

0.2% (15): $93.02

Mechanism of Action Selective agonism for alpha$_2$-receptors; causes reduction of aqueous humor formation and increased uveoscleral outflow

Pharmacodynamics/Kinetics

Onset of action: Peak effect: 2 hours

Metabolism: Hepatic

Half-life elimination: 2-3 hours

Time to peak, plasma: 0.5-2.5 hours

Excretion: Urine (74%)

Related Information

- Glaucoma Drug Therapy

Pharmacotherapy Pearls The use of Purite® as a preservative in Alphagan® P has lead to a reduced incidence of certain adverse effects associated with products using benzalkonium chloride as a preservative. The 0.1% and 0.15% solutions are comparable to the 0.2% solution in lowering intraocular pressure.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Drowsiness is common

Mental Health: Effects on Psychiatric Treatment Contraindicated with MAO inhibitors; concurrent use with psychotropics may produce additive sedation

Index Terms Brimonidine Tartrate

Brinzolamide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(brin ZOH la mide)
U.S. Brand NamesAzopt®
Canadian Brand NamesAzopt®
Pharmacologic CategoryCarbonic Anhydrase Inhibitor; Ophthalmic Agent, Antiglaucoma
Use: Labeled IndicationsLowers intraocular pressure in patients with ocular hypertension or open-angle glaucoma
Dosing: AdultsGlaucoma: Ophthalmic: Instill 1 drop in affected eye(s) 3 times/day
Dosing: ElderlyRefer to adult dosing.
Administration: OtherMay be used concomitantly with other topical ophthalmic drug products to lower intraocular pressure. If more than one topical ophthalmic drug is being used, administer drugs at least 10 minutes apart.
StorageStore at 4°C to 30°C (39°F to 86°F). Shake well before use.
ContraindicationsHypersensitivity to brinzolamide, sulfonamides, or any component of the formulation
Allergy Considerations

- Carbonic Anhydrase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Systemic absorption may cause serious hypersensitivity reactions to recur.
- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.
- Systemic effects: Systemic absorption and adverse effects (similar to sulfonamides) including, blood dyscrasias, Stevens-Johnson syndrome, toxic epidermal necrolysis, and fulminant hepatic necrosis may occur with ophthalmic use.

Disease-related concerns:

- Acute angle-closure glaucoma: Has not been studied in acute angle-closure glaucoma.
- Hepatic impairment: Safety and efficacy have not been established with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment; parent and metabolite may accumulate.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Prolonged use: Effects of prolonged use on corneal epithelial cells have not been evaluated.

Geriatric ConsiderationsThe oral carbonic anhydrase inhibitors are useful for patients who have difficulty administering ophthalmic drugs, who do not achieve sufficient lowering of intraocular pressure, or who cannot tolerate other agents. Brinzolamide is a useful agent apart from those who need a carbonic anhydrase inhibitor and can administer ophthalmic drops.
Pregnancy Risk FactorC
Pregnancy ConsiderationsDevelopmental toxicities have been observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if the potential benefit to the mother outweighs the possible risk to the fetus.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

1% to 10%:

Dermatologic: Dermatitis (1% to 5%)

Gastrointestinal: Taste disturbances (5% to 10%)

Ocular: Blurred vision (5% to 10%), blepharitis (1% to 5%), dry eye (1% to 5%), foreign body sensation (1% to 5%), eye discharge (1% to 5%), eye pain (1% to 5%), itching of eye (1% to 5%)

Respiratory: Rhinitis (1% to 5%)

<1%: Allergic reactions alopecia, chest pain, conjunctivitis, diarrhea, diplopia, dizziness, dyspnea, eye fatigue, headache, lid crusting, nausea, pharyngitis, urticaria, xerostomia

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)
Drug Interactions

Memantine: Carbonic Anhydrase Inhibitors may decrease the excretion of Memantine. *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Monitoring ParametersIntraocular pressure
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic response and adverse effects. Measure intraocular pressure periodically. Teach patient proper use, side effects/appropriate interventions, and symptoms to report
Patient EducationFor use in eyes only. Tilt head back, place medication in conjunctival sac, and close eyes. Apply finger pressure at corner of eye for 1 minute following application. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). If using other ophthalmic preparations, administer 10 minutes apart. Avoid excessive use of aspirin or aspirin-containing medications (may cause toxicity). May cause taste changes; runny nose; or vision changes (blurred vision, dry eye, foreign body sensation, eye discharge, temporary sensitivity to bright light, blurring or stinging, altered distance perception, reduced night vision acuity). Report persistent dizziness or headache, skin rash, loss of hair, unresolved GI disturbance, difficulty breathing, or persistent sore throat. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Suspension, ophthalmic:

Azopt®: 1% (5 mL [DSC], 10 mL, 15 mL) [contains benzalkonium chloride]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Suspension (Azopt)

1% (10): $85.99

1% (15): $119.99

Mechanism of ActionBrinzolamide inhibits carbonic anhydrase, leading to decreased aqueous humor secretion. This results in a reduction of intraocular pressure.
Pharmacodynamics/Kinetics

Onset of action: Peak effect: 2 hours

Duration: 8-12 hours

Absorption: Topical: Into systemic circulation

Distribution: Accumulates in red blood cells, binding to carbonic anhydrase (brinzolamide and metabolite)

Metabolism: To N-desmethyl brinzolamide

Excretion: Urine (as unchanged drug and metabolites)

Related Information

- Glaucoma Drug Therapy

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste disturbances.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay rarely cause dizziness
Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

International issues:

Lexotan® [multiple international markets] may be confused with Cefotan® which is a brand name for cefotetan in the U.S.

Lexotan® [multiple international markets] may be confused with Cefiton® which is a brand name for cefixime in Portugal

Lexotan® [multiple international markets] may be confused with Loxitane® which is a brand name for loxapine in the U.S.

Pronunciation(broe MA ze pam)

Canadian Brand NamesApo-Bromazepam®; Gen-Bromazepam; Lectopam®; Novo-Bromazepam; Nu-Bromazepam; Pro Doc Limitee Bromazepam

Pharmacologic CategoryBenzodiazepine

Use: Labeled IndicationsShort-term, symptomatic treatment of anxiety

Dosing: AdultsAnxiety: Oral: Initial: 6-18 mg/day in equally divided doses. Initial course of treatment should not last longer than 1 week. Optimal dosage range: 6-30 mg/day.

Debilitated patients: Initial dose: 3 mg/day in divided doses

Dosing: ElderlyInitial dose: 3 mg/day in divided doses

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at 20°C to 25°C (68°F to 77°F).

RestrictionsCDSA IV; Not available in U.S.

ContraindicationsHypersensitivity to bromazepam or any component of the formulation (cross-sensitivity with other benzodiazepines may exist); myasthenia gravis; narrow-angle glaucoma; severe hepatic or respiratory disease; sleep apnea; pregnancy

Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.
- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury.

- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.

- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Pregnancy Risk FactorD (based on other benzodiazepines)
Pregnancy ConsiderationsCrosses the placenta. Oral clefts reported, however, more recent data does not support an association between drug and oral clefts; inguinal hernia, cardiac defects, spina bifida, dysmorphic facial features, skeletal defects, multiple other malformations reported; hypotonia and withdrawal symptoms reported following use near time of delivery.
LactationEnters breast milk/contraindicated (AAP rates other benzodiazepines “of concern”)
Breast-Feeding ConsiderationsCrosses into breast milk. Clinical effects on the infant: Sedation; AAP reports benzodiazepine use MAY BE OF CONCERN.
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension, palpitation, tachycardia

Central nervous system: Drowsiness, ataxia, dizziness, confusion, depression, euphoria, lethargy, slurred speech, stupor, headache, seizure, anterograde amnesia. In addition, paradoxical reactions (including excitation, agitation, hallucinations, and psychosis) are known to occur with benzodiazepines.

Dermatologic: Rash, pruritus

Endocrine & metabolic: Hyperglycemia, hypoglycemia

Gastrointestinal: Xerostomia, nausea, vomiting

Genitourinary: Incontinence, libido decreased

Hematologic: Hemoglobin decreased, hematocrit decreased, WBCs increased/decreased

Hepatic: Transaminases increased, alkaline phosphatase increased, bilirubin increased

Neuromuscular & skeletal: Weakness, muscle spasm

Ocular: Blurred vision, depth perception decreased

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP2E1 (weak)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Serum concentration may be increased by grapefruit juice.

Herb/Nutraceutical: St John's wort may decrease bromazepam serum concentrations. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Nursing: Physical Assessment/MonitoringFor inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions (see Adverse Reactions) at beginning of therapy and periodically with long-term use.

Patient EducationTake exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, loss of appetite, or dry mouth (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help). Report CNS changes (eg, confusion, depression, increased sedation, excitation, headache, agitation, insomnia or nightmares, dizziness, fatigue, or impaired coordination) or changes in cognition; respiratory difficulty or shortness of breath; changes in urinary pattern; changes in sexual activity; muscle cramping, weakness, tremors, or rigidity; ringing in ears or visual disturbances, excessive perspiration, or excessive GI symptoms (eg, cramping, constipation, vomiting, anorexia). **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet: 1.5 mg, 3 mg, 6 mg [not available in the U.S.]

Generic AvailableYes

ManufacturerHoffman-La Roche Ltd

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Protein binding: 70%

Metabolism: Hepatic

Bioavailability: 60%

Half-life elimination: 20 hours

Excretion: Urine (69%), as metabolites

Related Information

- Discontinuation of Psychotropic Drugs
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsNot available in U.S.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Bromfenac

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(BROME fen ak)
U.S. Brand NamesXibrom™
Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Ophthalmic
Use: Labeled IndicationsTreatment of postoperative inflammation and reduction in ocular pain following cataract removal
Dosing: AdultsOphthalmic: Instill 1 drop into affected eye(s) twice daily beginning 24 hours after surgery and continuing for 2 weeks postoperatively
Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo adjustment required.
StorageStore at 15°C to 25°C (59°F to 77°F).
Warnings/Precautions

Concerns related to adverse effects:

- Aspirin/NSAID sensitivity: Use with caution in patients with previous sensitivity to acetylsalicylic acid and phenylacetic acid derivatives, including patients who experience bronchospasm, asthma, rhinitis, or urticaria following NSAID or aspirin.

- Keratitis: May cause keratitis; continued use in a patient with keratitis may cause severe corneal adverse reactions, potentially resulting in loss of vision. Immediately discontinue use in patients with evidence of corneal epithelial damage.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with a predisposition to bleeding (bleeding tendencies or medications which interfere with coagulation).

- Diabetes: Use with caution in patients with diabetes mellitus; may be at risk of corneal adverse events, potentially resulting in loss of vision.

- Ocular disease: Use with caution in patients with complicated ocular surgeries, corneal denervation, corneal epithelial defects, ocular surface disease, or repeat ocular surgeries (within a short timeframe); may be at risk of corneal adverse events, potentially resulting in loss of vision.

- Rheumatoid arthritis: Use with caution in patients with rheumatoid arthritis; may be at risk of corneal adverse events, potentially resulting in loss of vision.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Surgery patients: May slow/delay healing or prolong bleeding time following surgery.

Dosage form specific issues:

- Sulfites: Contains sulfites, which may cause allergic reactions.

Other warnings/precautions:

- Duration of therapy: Use for more than 1 day prior to surgery or for 14 days beyond surgery may increase risk and severity of corneal adverse events.

- Soft contact lenses: Patients using ophthalmic drops should not wear soft contact lenses.

Geriatric ConsiderationsNo differences in safety and efficacy noted between elderly and younger adults. No dosage adjustment necessary. Elderly may be taking other medications that will increase bleeding.
Pregnancy Risk FactorC/D (3rd trimester)
Pregnancy ConsiderationsSafety and efficacy in pregnant women have not been established. In animal studies, at exposures much higher than those which would result from ophthalmic use, embryo-fetal lethality and increased postimplantation loss occurred. Exposure to nonsteroidal anti-inflammatory drugs late in pregnancy may lead to premature closure of the ductus arteriosus and may inhibit uterine contractions.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

2% to 7%:

Central nervous system: Headache

Ocular: Abnormal vision, abnormal sensation, conjunctival hyperemia, eye pain, iritis, pruritus

Postmarketing and/or case reports: Corneal erosion, corneal thinning, corneal perforation, epithelial breakdown

Drug Interactions

Latanoprost: NSAID (Ophthalmic) may diminish the therapeutic effect of Latanoprost. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringAssess for intraocular bleeding. Evaluate allergy history with aspirin or other NSAIDs. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationDo not wear contact lenses while using this medication. Report any abnormal sensation in eye, redness, severe headache, or pain.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic:

Xibrom™: 0.09% (2.5 mL, 5 mL) [contains benzalkonium chloride and sodium sulfite]

Generic AvailableNo

ManufacturerISTA Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Solution (Xibrom)

0.09% (2.5): $104.70

0.09% (5): $194.44

Mechanism of ActionInhibits prostaglandin synthesis by decreasing the activity of the enzyme, cyclooxygenase, which results in decreased formation of prostaglandin precursors.

Pharmacodynamics/Kinetics

Absorption: Theoretically, systemic absorption may occur following ophthalmic use (not characterized); anticipated levels are below the limits of assay detection

Metabolism: Hepatic

Half-life elimination: 0.5-4 hours (following oral administration)

Pharmacotherapy PearlsAn oral formulation of bromfenac was previously available and was withdrawn from the market following reports of idiosyncratic hepatotoxicity.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsBromfenac Sodium

International Brand NamesNatax (AR)

Bromocriptine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Bromocriptine may be confused with benztropine, brimonidine

Parlodel® may be confused with pindolol, Provera®

Pronunciation(broe moe KRIP teen)

U.S. Brand NamesParlodel®; Parlodel® SnapTabs®

Canadian Brand NamesApo-Bromocriptine®; Parlodel®; PMS-Bromocriptine

Pharmacologic CategoryAnti-Parkinson's Agent, Dopamine Agonist; Ergot Derivative

Use: Labeled IndicationsTreatment of hyperprolactinemia associated with amenorrhea with or without galactorrhea, infertility, or hypogonadism; treatment of prolactin-secreting adenomas; treatment of acromegaly; treatment of Parkinson's disease

Use: Unlabeled/InvestigationalNeuroleptic malignant syndrome

Dosing: Adults

Parkinsonism: Oral: 1.25 mg twice daily, increased by 2.5 mg/day in 2- to 4-week intervals (usual dose range is 30-90 mg/day in 3 divided doses; maximum: 100 mg/day), though elderly patients can usually be managed on lower doses.

Neuroleptic malignant syndrome (unlabeled use): Oral: 2.5-5 mg 3 times/day

Acromegaly: Oral: Initial: 1.25-2.5 mg daily increasing by 1.25-2.5 mg daily as necessary every 3-7 days; usual dose: 20-30 mg/day (maximum: 100 mg/day)

Hyperprolactinemia: Oral: Initial: 1.25-2.5 mg/day; may be increased by 2.5 mg/day as tolerated every 2-7 days until optimal response (range: 2.5-15 mg/day)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Hyperprolactinemia: Oral:

Children 11-15 years (based on limited information): Initial: 1.25-2.5 mg daily. Dosage may be increased as tolerated to achieve a therapeutic response (range 2.5-10 mg daily).

Children ≥16 years: Refer to adult dosing.

Dosing: Hepatic ImpairmentNo guidelines are available, however, adjustment may be necessary.

Dietary ConsiderationsMay be taken with food to decrease GI distress.

ContraindicationsHypersensitivity to bromocriptine, ergot alkaloids, or any component of the formulation; ergot alkaloids are contraindicated with potent inhibitors of CYP3A4 (includes protease inhibitors, azole antifungals, and some macrolide antibiotics); uncontrolled hypertension; severe ischemic heart disease or peripheral vascular disorders; pregnancy (risk to benefit evaluation must be performed in women who become pregnant during treatment for acromegaly, prolactinoma, or Parkinson's disease - hypertension during treatment should generally result in efforts to withdraw)

Allergy Considerations

- Ergot Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac valvular fibrosis: Ergot alkaloids and derivatives have been associated with fibrotic valve thickening (eg, aortic, mitral, tricuspid); usually associated with long-term, chronic use.
- Cardiovascular effects: Symptomatic hypotension may occur in a significant number of patients. In addition, hypertension, seizures, MI, and stroke have been rarely associated with therapy. Severe headache or visual changes may precede events. The onset of reactions may be immediate or delayed (often may occur in the second week of therapy).
- Impulsive control disorders: Dopamine agonists used for Parkinson’s disease or restless legs syndrome have been associated with compulsive behaviors and/or loss of impulse control, which has manifested as pathological gambling, libido increases (hypersexuality), and/or binge eating. Causality has not been established, and controversy exists as to whether this phenomenon is related to the underlying disease, prior behaviors/addictions and/or drug therapy. Dose reduction or discontinuation of therapy has been reported to reverse these behaviors in some, but not all cases.
- Pleural/retroperitoneal fibrosis: Rare cases of pleural and/or retroperitoneal fibrosis have been reported with prolonged daily use.

- Sedation: Sudden sleep onset and somnolence have been reported with use, primarily in patients with Parkinson's disease. Patients must be cautioned about performing tasks which require mental alertness.

Disease-related concerns:

- Acromegaly: Appropriate use: In the treatment of acromegaly, discontinuation is recommended if tumor expansion occurs during therapy. Digital vasospasm (cold sensitive) may occur in some patients with acromegaly; may require dosage reduction.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (myocardial infarction, arrhythmia). Should not be used postpartum in women with coronary artery disease or other cardiovascular disease; use to control or prevent lactation or in patients with uncontrolled hypertension is not recommended.
- Dementia: Use with caution in patients with dementia.
- Hepatic impairment: Safety and efficacy have not been established in patients with hepatic impairment.
- Macroadenomas: Discontinuation of therapy in patients with macroadenomas has been associated with rapid regrowth of tumor and increased prolactin serum levels.
- Parkinson's disease: Safety has not been established for use >2 years in patients with Parkinson's disease.
- Peptic ulcer disease: Use with caution in patients with peptic ulcer disease.
- Psychosis: Use with caution in patients with psychosis.
- Renal disease: Safety and efficacy have not been established in patients with renal impairment.

Concurrent drug therapy issues:

- Antihypertensives: Concurrent antihypertensives or drugs which may alter blood pressure should be used with caution.
- Levodopa: Concurrent use with levodopa has been associated with an increased risk of hallucinations; consider dosage reduction and/or discontinuation in patients with hallucinations. Hallucinations may require weeks to months before resolution.

Special populations:

- Pediatrics: Safety and effectiveness have not been established in children <11 years of age for pituitary adenoma.
- Pregnancy: Patients who receive during and immediately following pregnancy as a continuation of previous therapy (eg, acromegaly) should be closely monitored for cardiovascular effects.

Other warnings/precautions:

- Pituitary function evaluation: Complete evaluation of pituitary function should be completed prior to initiation of treatment.
- Visual monitoring: Monitoring and careful evaluation of visual changes during the treatment of hyperprolactinemia is recommended to differentiate between tumor shrinkage and traction on the optic chiasm; rapidly progressing visual field loss requires neurosurgical consultation.

Geriatric ConsiderationsNo special considerations are recommended since drug is dosed to response; however, elderly may have concomitant diseases or drug therapy which may complicate therapy.

Pregnancy Risk FactorB

Pregnancy ConsiderationsNo evidence of teratogenicity or fetal toxicity in animal studies. Bromocriptine is used for ovulation induction in women with hyperprolactinemia. In general, therapy should be discontinued if pregnancy is confirmed unless needed for treatment of macroprolactinoma. Data collected from women taking bromocriptine during pregnancy suggest the incidence of birth defects is not increased with use. However, the majority of women discontinued use within 8 weeks of pregnancy. Women not seeking pregnancy should be advised to use appropriate contraception.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsA previous indication for prevention of postpartum lactation was withdrawn voluntarily by the manufacturer following reports of serious adverse reactions, including stroke, MI, seizures, and severe hypertension. Based on the risk/benefit assessment, other treatments should be considered for lactation suppression.

Adverse Reactions**Note:** Frequency of adverse effects may vary by dose and/or indication.

>10%:

Central nervous system: Dizziness, headache

Gastrointestinal: Constipation, nausea

1% to 10%:

Cardiovascular: Hypotension (including postural/orthostatic), Raynaud's syndrome exacerbation, syncope

Central nervous system: Drowsiness, fatigue, lightheadedness

Gastrointestinal: Abdominal cramps, anorexia, diarrhea, dyspepsia, GI bleeding, vomiting, xerostomia

Neuromuscular & skeletal: Digital vasospasm

Respiratory: Nasal congestion

Frequency not defined, postmarketing, and/or case reports: Abdominal discomfort, alcohol potentiation, alopecia, anxiety, arrhythmia, ataxia, blepharospasm, blurred vision, bradycardia, cerebrospinal fluid rhinorrhea, cold tolerance decreased, confusion, constrictive pericarditis, delusional psychosis, depression, dyskinesia, dysphagia, dyspnea, ear tingling, epileptiform seizure, ergotism, erythromelalgia, facial pallor, faintness, hallucinations, heavy headedness, insomnia, involuntary movements, lassitude, lethargy, lightheadedness, mottling of skin, muscle cramps, nervousness, nightmares, “on-off” phenomenon, paranoia, paresthesia, pericardial effusion, peripheral edema, pleural effusion, pleural/pulmonary fibrosis, psychomotor agitation/excitation, rash, sleep requirement decreased, sluggishness, urinary frequency, urinary retention, vasovagal attack, ventricular tachycardia, vertigo, visual disturbance, weakness

Withdrawal reactions: Abrupt discontinuation has resulted in rare cases of a withdrawal reaction with symptoms similar to neuroleptic malignant syndrome.

Postmarketing and/or case reports: Reported with dopamine agonists: Impulsive/compulsive behaviors (eg, pathological gambling, hypersexuality, binge eating)

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (weak), 3A4 (weak)

Drug Interactions

Alpha-/Beta-Agonists: May enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Antipsychotics (Atypical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Antipsychotics (Typical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

CycloSPORINE: Bromocriptine may increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Efavirenz: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically, the risk for peripheral vasospasm and ischemia may be increased. *Risk X: Avoid combination*

Macrolide Antibiotics: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically leading the development of ergotism. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Metoclopramide: May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk C: Monitor therapy*

Posaconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Protease Inhibitors: May decrease the metabolism of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: Ergot Derivatives may enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Ergot Derivatives. This may cause serotonin syndrome. *Risk X: Avoid combination*

Voriconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase GI side effects or ethanol intolerance).

Herb/Nutraceutical: St John's wort may decrease bromocriptine levels.

Monitoring ParametersMonitor blood pressure closely as well as hepatic, hematopoietic, and cardiovascular function; visual field monitoring is recommended (prolactinoma); pregnancy test during amenorrheic period; growth hormone and prolactin levels.

Nursing: Physical Assessment/MonitoringMonitor blood pressure at beginning of therapy and periodically during course of treatment. Assess therapeutic effectiveness (eg, mental status, involuntary movements) and adverse reactions at beginning of therapy and periodically throughout therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsPregnancy test during amenorrheic period; growth hormone and prolactin levels

Patient EducationTake exactly as directed (may be prescribed in conjunction with levodopa/carbidopa); do not change dosage or discontinue this medicine without consulting prescriber. Therapeutic effects may take several weeks or months to achieve and you may need frequent monitoring during first weeks of therapy. Take with meals if GI upset occurs, before meals if dry mouth occurs, or after eating if drooling or if nausea occurs. Take at the same time each day. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake; void before taking medication. Do not use alcohol, prescription or OTC sedatives, or CNS depressants without consulting prescriber. Urine or perspiration may appear darker. You may experience drowsiness (can be sudden onset), dizziness, confusion, or vision changes (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); loss of impulse control (possibly manifested as pathological gambling, libido increases, and/or binge eating); orthostatic hypotension (use caution when rising from sitting or lying position); constipation (increased exercise, fluids, fruit, or fiber may help); nasal congestion (consult prescriber for appropriate relief); or nausea, vomiting, loss of appetite, or stomach discomfort (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report unresolved constipation or vomiting; chest pain or irregular heartbeat; acute headache or dizziness; CNS changes (eg, hallucination, loss of memory, seizures, acute headache, nervousness); suicide ideation; painful or difficult urination; increased muscle spasticity, rigidity, or involuntary movements; skin rash; or significant worsening of condition. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as mesylate: 5 mg

Parlodel®: 5 mg

Tablet, as mesylate: 2.5 mg

Parlodel® SnapTabs®: 2.5 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Parlodel)

5 mg (30): $213.65

Tablets (Bromocriptine Mesylate)

2.5 mg (30): $61.99

Tablets (Parlodel)

2.5 mg (30): $135.37

Mechanism of ActionSemisynthetic ergot alkaloid derivative and a dopamine receptor agonist which activates postsynaptic dopamine receptors in the tuberoinfundibular (inhibiting pituitary prolactin secretion) and nigrostriatal pathways (enhancing coordinated motor control).

Pharmacodynamics/Kinetics

Onset of action: Prolactin decreasing effect: 1-2 hours

Protein binding: 90% to 96%

Metabolism: Primarily hepatic via CYP3A; extensive first-pass biotransformation

Bioavailability: 28%

Half-life elimination: Biphasic: Terminal: 15 hours (range 8-20 hours)

Time to peak, serum: 1-3 hours

Excretion: Feces; urine (2% to 6% as unchanged drug and metabolites)

Related Information

- Antiparkinsonian Agents
- Discontinuation of Psychotropic Drugs

Pharmacotherapy PearlsUsually used with levodopa or levodopa/carbidopa to treat Parkinson's disease. When adding bromocriptine, the dose of levodopa/carbidopa can usually be decreased.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause hallucinations

Mental Health: Effects on Psychiatric TreatmentUsed to treat neuroleptic malignant syndrome and cocaine abuse; fluvoxamine and nefazodone may increase bromocriptine concentrations; monitor for hypotension, headache, nausea

Index TermsBromocriptine Mesylate

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Pronunciation(brome fen IR a meen, soo doe e FED rin, & deks troe meth OR fan)

U.S. Brand NamesAccuHist® PDX Drops; AllanHist PDX; Anaplex® DM; Anaplex® DMX; Andehist DM NR; Bromaline® DM [OTC]; Bromatane DX; Brometane DX [DSC]; Bromhist DM; Bromhist PDX; Bromphenex DM; Bromplex DX; Brotapp-DM; Carbofed DM; EndaCof-DM; EndaCof-PD; Histacol™ BD; Myphetane DX; PediaHist DM

Pharmacologic CategoryAlpha/Beta Agonist; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsRelief of cough and upper respiratory symptoms (including nasal congestion) associated with allergy or the common cold

Dosing: Adults

Cough and upper respiratory symptoms associated with common cold: Oral:

Anaplex® DM: 5 mL every 4-6 hours (maximum: 4 doses/24 hours)

Anaplex® DMX: 5 mL every 12 hours (maximum: 10 mL/24 hours)

Bromaline® DM: 20 mL every 4-6 hours (maximum: 4 doses/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Cough and upper respiratory symptoms: Oral:

1-3 months (AccuHist® PDX, EndaCof-PD): 0.25 mL 4 times/day

3-6 months (AccuHist® PDX, EndaCof-PD): 0.5 mL 4 times/day

6-12 months (AccuHist® PDX, EndaCof-PD): 0.75 mL 4 times/day

12-24 months (AccuHist® PDX, EndaCof-PD): 1 mL 4 times/day

2-6 years:

Anaplex® DM, EndaCof-DM: 1.25 mL every 4-6 hours (maximum: 4 doses/24 hours)

Anaplex® DMX: 1.25 mL every 12 hours (maximum: 2.5 mL/24 hours)

6-12 years:

Anaplex® DM, EndaCof-DM: 2.5 mL every 4-6 hours (maximum: 4 doses/24 hours)

Anaplex® DMX: 2.5 mL every 12 hours (maximum: 5 mL/24 hours)

Bromaline® DM: 10 mL every 4-6 hours (maximum: 4 doses/24 hours)

≥12 years: Refer to adult dosing.

Administration: OralAnaplex® DMX: Shake well prior to use.

StorageStore between 8°C to 30°C (46°F to 86°F). Avoid exposure to heat; keep tightly closed.

ContraindicationsHypersensitivity to brompheniramine, pseudoephedrine, dextromethorphan or any component of the formulation; severe hypertension or coronary artery disease; MAO inhibitor therapy; GI or GU obstruction; peptic ulcer disease; narrow-angle glaucoma; acute asthma attack

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Asthma: Use with caution in patients with a history of asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in sedated, debilitated patients confined to supine position.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children. Use with caution in atopic children.

Pregnancy Risk FactorC

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsSmall amounts of antihistamines and pseudoephedrine are excreted in breast milk. Premature infants and newborns have a higher risk of intolerance to antihistamines. Antihistamines may inhibit lactation.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, flushing, hypertension, pallor, palpitation, tachycardia

Central nervous system: Convulsions, CNS stimulation, dizziness, drowsiness, excitability (children; rare), giddiness, hallucinations, headache, insomnia, irritability, lassitude, nervousness, sedation

Dermatologic: Photosensitivity, pruritus, rash, urticaria

Gastrointestinal: Anorexia, constipation, diarrhea, dyspepsia, GI upset, nausea, vomiting, xerostomia

Hematologic: Agranulocytosis, hemolytic anemia, thrombocytopenia

Neuromuscular skeletal: Tremors, weakness

Ocular: Diplopia

Renal: Dysuria, polyuria, urinary retention (with BPH)

Respiratory: Respiratory difficulty

Metabolism/Transport EffectsDextromethorphan: **Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QuiNIDine: May decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Dextromethorphan. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Elixir:

Bromaline® DM: Brompheniramine maleate 1 mg, pseudoephedrine hydrochloride 15 mg, and dextromethorphan hydrobromide 5 mg per 5 mL (120 mL, 480 mL) [alcohol free; contains sodium benzoate; grape flavor]

Liquid:

Bromplex DM: Brompheniramine maleate 4 mg, pseudoephedrine hydrochloride 60 mg, and dextromethorphan hydrobromide 30 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free]

Brotapp-DM: Brompheniramine maleate 1 mg, pseudoephedrine hydrochloride 15 mg, and dextromethorphan hydrobromide 5 mg per 5 mL (120 mL, 240 mL) [grape flavor]

Solution, oral [drops]:

AccuHist® PDX, AllanHist PDX: Brompheniramine maleate 1 mg, pseudoephedrine hydrochloride 12.5 mg, and dextromethorphan hydrobromide 3 mg per 1 mL (30 mL) [alcohol free, sugar free; contains sodium benzoate; grape flavor]

Bromhist DM, PediaHist DM: Brompheniramine maleate 1 mg, pseudoephedrine hydrochloride 15 mg, and dextromethorphan hydrobromide 4 mg per 1 mL (30 mL) [grape flavor]

Bromhist PDX, EndaCof-PD: Brompheniramine maleate 1 mg, pseudoephedrine hydrochloride 12.5 mg, and dextromethorphan hydrobromide 3 mg per 1 mL (30 mL) [grape flavor]

Histacol™ BD: Brompheniramine maleate 1 mg, pseudoephedrine hydrochloride 12.5 mg, and dextromethorphan hydrobromide 3 mg per 1 mL (30 mL) [contains sodium benzoate; grape flavor]

Suspension: Brompheniramine tannate 8 mg, pseudoephedrine tannate 90 mg, and dextromethorphan tannate 60 mg per 5 mL (480 mL)

Anaplex® DMX: Brompheniramine tannate 8 mg, pseudoephedrine tannate 90 mg, and dextromethorphan tannate 60 mg per 5 mL (480 mL) [alcohol free, sugar free; grape flavor]

Syrup: Brompheniramine maleate 4 mg, pseudoephedrine hydrochloride 60 mg, and dextromethorphan hydrobromide 30 mg per 5 mL (480 mL)

Anaplex® DM: Brompheniramine maleate 4 mg, pseudoephedrine hydrochloride 60 mg, and dextromethorphan hydrobromide 30 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; fruit flavor]

Andehist DM NR: Brompheniramine maleate 4 mg, pseudoephedrine hydrochloride 45 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [grape flavor]

Bromatane DX, Brometane DX [DSC]: Brompheniramine maleate 2 mg, pseudoephedrine hydrochloride 30 mg, and dextromethorphan hydrobromide 10 mg per 5 mL (480 mL)

Bromphenex DM: Brompheniramine maleate 4 mg, pseudoephedrine hydrochloride 60 mg, and dextromethorphan hydrobromide 30 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; fruit flavor]

Carbofed DM: Brompheniramine maleate 4 mg, pseudoephedrine hydrochloride 45 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [alcohol free, sugar free; grape flavor]

EndaCof-DM: Brompheniramine maleate 4 mg, pseudoephedrine hydrochloride 60 mg, and dextromethorphan hydrobromide 30 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; fruit flavor]

Myphetane DX: Brompheniramine maleate 2 mg, pseudoephedrine hydrochloride 30 mg, and dextromethorphan hydrobromide 10 mg per 5 mL (480 mL) [contains alcohol <1%; butterscotch flavor]

Sildec-DM: Brompheniramine maleate 4 mg, pseudoephedrine hydrochloride 45 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [grape flavor]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Syrup (Bromaxefed DM RF)

45-4-15 mg/5 mL (118): $18.00

Syrup (Rondec DM)

45-4-15 mg/5 mL (480): $103.10

Mechanism of ActionBrompheniramine maleate is an antihistamine with H_1-receptor activity; pseudoephedrine, a sympathomimetic amine and isomer of ephedrine, acts as a decongestant in respiratory tract mucous membranes with less vasoconstrictor action than ephedrine in normotensive individuals; dextromethorphan, a non-narcotic antitussive, increases cough threshold by its activity on the medulla oblongata.

Related Information

- Dextromethorphan
- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusMay cause CNS stimulation, insomnia, dizziness, hallucinations, irritability, nervousness, and drowsiness

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors

Index TermsDextromethorphan Hydrobromide, Brompheniramine Maleate, and Pseudoephedrine Hydrochloride; Pseudoephedrine Tannate, Dextromethorphan Tannate, and Brompheniramine Tannate

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state "Do not use in children under four years of age." In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Use: Labeled IndicationsTemporary relief of symptoms of seasonal and perennial allergic rhinitis, and vasomotor rhinitis, including nasal obstruction

Dosing: AdultsRhinitis and nasal congestion: Oral:

Capsule, long acting:

Based on 60 mg pseudoephedrine: 1-2 capsules every 12 hours

Based on 120 mg pseudoephedrine: 1 capsule every 12 hours

Liquid:

Based on brompheniramine 1 mg/pseudoephedrine 15 mg per 5 mL: 20 mL every 4 hours (maximum: 4 doses/24 hours)

Based on brompheniramine 4 mg/pseudoephedrine 30 mg: 5 mL 3 times/day

Brompheniramine 4 mg/pseudoephedrine 45 mg per 5 mL: 5 mL 4 times/day

Tablet, extended release: Based on pseudoephedrine 45 mg: 1-2 tablets every 12 hours

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRhinitis/nasal congestion: Oral:

Capsule, long acting:

Based on 60 mg pseudoephedrine:

Children 6-12 years: 1 capsule every 12 hours

Children ≥12 years: Refer to adult dosing.

Based on 120 mg pseudoephedrine: Children ≥12 years: Refer to adult dosing.

Liquid:

Based on brompheniramine 1 mg/pseudoephedrine 15 mg per 1 mL: Children:

1-3 months: 0.25 mL 4 times/day

3-6 months: 0.5 mL 4 times/day

6-12 months: 0.75 mL 4 times/day

12-24 months: 1 mL 4 times/day

Based on brompheniramine 1 mg/pseudoephedrine 15 mg per 5 mL: Children:

6-11 months (6-8 kg): 2.5 mL every 6-8 hours (maximum: 4 doses/24 hours)

12-23 months (8-10 kg): 3.75 mL every 6-8 hours (maximum: 4 doses/24 hours)

2-6 years: 5 mL every 6-8 hours (maximum: 4 doses/24 hours)

6-12 years: 10 mL every 6-8 hours (maximum: 4 doses/24 hours)

>12 years: Refer to adult dosing.

Based on brompheniramine 4 mg/pseudoephedrine 30 mg:

Children 2-6 years: 2.5 mL 3 times/day

Children >6 years: Refer to adult dosing.

Brompheniramine 4 mg/pseudoephedrine 45 mg per 5 mL:

Children 2-6 years: 2.5 mL 4 times/day

Children >6 years: Refer to adult dosing.

Tablet, extended release: Based on pseudoephedrine 45 mg:

Children 6-12 years: 1 tablet every 12 hours

Children ≥12 years: Refer to adult dosing.

Administration: OralDo not crush, break, or chew sustained-release dosage forms.
StorageStore at room temperature.
ContraindicationsHypersensitivity or idiosyncrasy to brompheniramine, pseudoephedrine, or any component of the formulation; severe hypertension, severe coronary artery disease; MAO inhibitor therapy; GI or GU obstruction; peptic ulcer disease; narrow-angle glaucoma; acute asthmatic attack
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Asthma: Use with caution in patients with a history of asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children. Not labeled for OTC use in children <6 years of age.

Other warnings/precautions:

- Self-medication (OTC use): When used for self-medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or are accompanied by fever. Discontinue and contact healthcare provider if nervousness, dizziness, or sleeplessness occur.

Pregnancy Risk FactorC
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsSmall amounts of antihistamines and pseudoephedrine are excreted in breast milk. Premature infants and newborns have a higher risk of intolerance to antihistamines. Antihistamines may inhibit lactation.
Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, flushing, hypertension, pallor, palpitation, tachycardia

Central nervous system: Convulsions, CNS stimulation, dizziness, excitability (children; rare), giddiness, hallucinations, headache, insomnia, irritability, lassitude, nervousness, sedation

Neuromuscular skeletal: Tremors, weakness

Ocular: Diplopia

Renal: Dysuria, polyuria, urinary retention (with BPH)

Respiratory: Respiratory difficulty

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Caplet, extended release:

Histex® SR: Brompheniramine maleate 10 mg and pseudoephedrine hydrochloride 120 mg

Capsule, extended release:

Bromfenex®: Brompheniramine maleate 12 mg and pseudoephedrine hydrochloride 120 mg [DSC]

Bromfenex® PD: Brompheniramine maleate 6 mg and pseudoephedrine hydrochloride 60 mg [DSC]

Lodrane® 24D: Brompheniramine maleate 12 mg and pseudoephedrine hydrochloride 90 mg

Capsule, sustained release:

Brovex SR: Brompheniramine maleate 9 mg and pseudoephedrine hydrochloride 90 mg

Respahist®: Brompheniramine maleate 6 mg and pseudoephedrine hydrochloride 60 mg

Touro® Allergy: Brompheniramine maleate 5.75 mg and pseudoephedrine hydrochloride 60 mg [DSC]

Elixir:

Dimaphen: Brompheniramine maleate 1 mg and pseudoephedrine hydrochloride 15 mg per 5 mL (120 mL, 480 mL)

Liquid: Brompheniramine maleate 4 mg and pseudoephedrine hydrochloride 60 mg per 5 mL (480 mL)

Brotapp: Brompheniramine maleate 1 mg and pseudoephedrine hydrochloride 15 mg per 5 mL (120 mL, 240 mL, 480 mL) [grape flavor]

Lodrane®: Brompheniramine maleate 4 mg and pseudoephedrine hydrochloride 60 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; cherry flavor] [DSC]

LoHist LQ: Brompheniramine maleate 4 mg and pseudoephedrine hydrochloride 60 mg per 5 mL (480 mL) [cherry flavor]

Liquid, oral [drops]:

AccuHist®: Brompheniramine maleate 1 mg and pseudoephedrine hydrochloride 12.5 mg per 1 mL (30 mL) [sugar free; cherry flavor]

Bromhist NR: Brompheniramine maleate 1 mg and pseudoephedrine hydrochloride 12.5 mg per 1 mL (30 mL) [cherry flavor]

Bromhist Pediatric: Brompheniramine maleate 1 mg and pseudoephedrine hydrochloride 15 mg per 1 mL (30 mL) [cherry flavor]

LoHist PD: Brompheniramine maleate 1 mg and pseudoephedrine hydrochloride 12.5 mg per 1 mL (30 mL) [cherry flavor]

Solution:

Bromaline®: Brompheniramine maleate 1 mg and pseudoephedrine hydrochloride 15 mg per 5 mL (120 mL, 480 mL) [alcohol free; contains sodium benzoate; grape flavor]

Suspension:

Lodrane® D: Brompheniramine tannate 8 mg and pseudoephedrine tannate 90 mg per 5 mL (480 mL) [alcohol free, sugar free; strawberry flavor]

Syrup:

Andehist NR: Brompheniramine maleate 4 mg and pseudoephedrine sulfate 45 mg per 5 mL (473 mL) [raspberry flavor]

Sildec: Brompheniramine maleate 4 mg and pseudoephedrine hydrochloride 45 mg per 5 mL (480 mL) [raspberry flavor]

Tablet, extended release:

Lodrane® 12D: Brompheniramine maleate 6 mg and pseudoephedrine hydrochloride 45 mg [dye free]

LoHist 12D: Brompheniramine maleate 6 mg and pseudoephedrine hydrochloride 45 mg

Tablet, prolonged release:

Touro® Allergy: Brompheniramine maleate 6 mg and pseudoephedrine hydrochloride 45 mg

Tablet, sustained release: Brompheniramine maleate 6 mg and pseudoephedrine hydrochloride 45 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Syrup (Bromaxefed RF)

4-45 mg/5 mL (473): $39.97

Tablet, 12-hour (Lodrane 12D)

6-45 mg (30): $12.81

Mechanism of ActionBrompheniramine maleate is an antihistamine with H_1-receptor activity; pseudoephedrine, a sympathomimetic amine and isomer of ephedrine, acts as a decongestant in respiratory tract mucous membranes with less vasoconstrictor action than ephedrine in normotensive individuals.

Pharmacodynamics/Kinetics

See Pseudoephedrine.

Brompheniramine:

Metabolism: Hepatic

Time to peak: Syrup: 5 hours

Excretion: Urine

Related Information

- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Brompheniramine: Prolonged use may decrease salivary flow.

Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusDrowsiness, nervousness, insomnia, and slight stimulation are common; may cause fatigue or dizziness; may rarely cause depression or hallucinations

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics and other CNS depressants may produce additive adverse effects; tachycardia is common; use caution with clozapine and TCAs

Index TermsBrompheniramine Maleate and Pseudoephedrine Hydrochloride; Brompheniramine Maleate and Pseudoephedrine Sulfate; Pseudoephedrine and Brompheniramine

International Brand NamesDimetapp (MX)

Special Alerts

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state "Do not use in children under four years of age." In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

Pronunciation(brome fen IR a meen)

U.S. Brand NamesB-Vex; Bidhist; BroveX™; BroveX™ CT ; Lodrane® 12 Hour ; Lodrane® 24; Lodrane® XR ; LoHist-12; TanaCof-XR

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of perennial and seasonal allergic rhinitis, vasomotor rhinitis, and other respiratory allergies

Dosing: AdultsAllergic rhinitis, allergic symptoms, vasomotor rhinitis: Oral:

B-Vex, BroveX™: 5-10 mL every 12 hours (maximum: 20 mL/day)

BroveX™ CT: 1-2 tablets every 12 hours (maximum: 4 tablets/day)

Lodrane® 12 Hour, LoHist: 1-2 tablets every 12 hours (maximum: 4 tablets/day)

Lodrane® 24: 1-2 capsules once daily

Lodrane® XR, TanaCof-XR: 5 mL every 12 hours (maximum: 10 mL/day)

Dosing: Elderly

Initial (also refer to adult dosing):

- B-Vex, BroveX™: 5 mL every 12 hours
- BroveX™ CT, Lodrane® 12 Hour, LoHist: 1 tablet every 12 hours
- Lodrane® 24: 1 capsule/24 hours
- Lodrane® XR, TanaCof-XR: 2.5 mL every 12 hours

Dosing: PediatricAllergic rhinitis, allergic symptoms, vasomotor rhinitis: Oral: Children:

1-2 years (B-Vex, BroveX™): 1.25 mL every 12 hours (maximum: 2.5 mL/day)

2-6 years:

- B-Vex, BroveX™: 2.5 mL every 12 hours (maximum: 5 mL/day)
- BroveX™ CT: $^1/_2$ tablet every 12 hours (maximum: 1 tablet/day)
- Lodrane® XR, TanaCof-XR: 1.25 mL every 12 hours (maximum: 2.5 mL/day)

6-12 years:

- B-Vex, BroveX™: 5 mL every 12 hours (maximum: 10 mL/day)
- BroveX™ CT: $^1/_2$ to 1 tablet every 12 hours (maximum: 2 tablets/day)
- Lodrane® 12 Hour, LoHist-12: One tablet every 12 hours (maximum: 2 tablets/day)
- Lodrane® 24: One capsule once daily
- Lodrane® XR, TanaCof-XR: 2.5 mL every 12 hours (maximum: 5 mL/day)

>12 years (B-Vex, BroveX™, BroveX™ CT, Lodrane® 12 Hour, Lodrane® 24, Lodrane® XR, LoHist-12, TanaCof-XR): Refer to adult dosing.

Administration: OralExtended release tablets are to be swallowed whole; do not crush or chew.

Dietary ConsiderationsMay be taken with food, water, or milk. TanaCof-XR contains phenylalanine.

StorageStore between 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to brompheniramine or any component of the formulation; use with or within 14 days of MAO inhibitor therapy; narrow-angle glaucoma; urinary retention; peptic ulcer disease; during acute asthmatic attacks

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Asthma: Use with caution in patients with a history of asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.
- Tartrazine: Some products may contain tartrazine.

Geriatric ConsiderationsAnticholinergic action may cause significant confusional symptoms, constipation, or problems voiding urine. If an antihistamine is indicated, a second generation nonsedating antihistamine would be a more appropriate choice.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use in pregnancy only when clearly needed. May cause severe reactions (convulsions) in newborns and premature infants; avoid use in 3rd trimester.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsSome antihistamines are excreted in breast milk. Premature infants and newborns have a higher risk of intolerance to antihistamines. Use while breast-feeding is contraindicated by the manufacturer.

Adverse ReactionsFrequency not defined.

Cardiovascular: Angina, blood pressure increased, circulatory collapse, extrasystoles, hypotension, palpitation, tachycardia

Central nervous system: Anxiety, chills, confusion, coordination impaired, dizziness, drowsiness, euphoria, excitation, fatigue, headache, hysteria, insomnia, irritability, nervousness, neuritis, restlessness, sedation, seizure, sleepiness, stimulation, tension, vertigo

Dermatologic: Photosensitivity, rash, urticaria

Endocrine & metabolic: Early menses

Gastrointestinal: Abdominal cramps, anorexia, constipation, diarrhea, dry throat, epigastric distress, nausea, vomiting, xerostomia

Genitourinary: Dysuria, polyuria, urinary retention

Hematologic: Agranulocytosis, hemolytic anemia, hypoplastic anemia, thrombocytopenia

Neuromuscular & skeletal: Paresthesia, tremor, weakness

Ocular: Blurred vision, diplopia, mydriasis

Otic: Labyrinthitis (acute), tinnitus

Respiratory: Dry nose, nasal congestion, thickening of bronchial secretions, wheezing

Miscellaneous: Anaphylactic shock, diaphoresis

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Test InteractionsMay interfere with skin tests using allergen extracts.

Nursing: Physical Assessment/MonitoringMonitor therapeutic response and adverse reactions. Assess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Patient EducationInform prescriber of all prescription medications, OTC medications, or herbal products you are taking. Avoid alcohol, depressants, and sleep inducing medication unless approved by prescriber. You may experience drowsiness or dizziness (use caution when driving or engaging in activities requiring alertness until response to drug is known). Report persistent sedation, confusion, or agitation; changes in urinary pattern, blurred vision, chest pain, rapid heart beat, or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release:

Lodrane® 24: 12 mg [dye free]

Suspension, as tannate:

B-Vex, BroveX™: 12 mg/5 mL (120 mL) [contains sodium benzoate and tartrazine; banana flavor]

Lodrane® XR: 8 mg/5 mL (480 mL) [alcohol free, sugar free; strawberry flavor]

TanaCof-XR: 8 mg/5 mL (480 mL) [alcohol free, sugar free; contains phenylalanine; strawberry creme flavor]

Tablet, chewable, as tannate: 12 mg

BroveX™ CT: 12 mg [banana flavor]

Tablet, extended release, as maleate:

Bidhist: 6 mg

Tablet, extended release, as maleate [scored]:

Lodrane® 12 Hour, LoHist-12: 6 mg [dye free]

Tablet, timed release, as maleate: 6 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Lodrane 24)

12 mg (60): $59.99

Chewable (Brovex CT)

12 mg (60): $79.99

Tablet, 12-hour (Lodrane 12 Hour)

6 mg (100): $47.22

Mechanism of ActionCompetes with histamine for H_1-receptor sites on effector cells

Pharmacodynamics/Kinetics

Metabolism: Hepatic

Excretion: Urine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Chronic use of antihistamines will inhibit salivary flow, particularly in elderly patients; this may contribute to periodontal disease and oral discomfort.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause agitation, confusion, dizziness, drowsiness, or fatigue. May cause paradoxical excitation in pediatric patients; may cause hallucinations in overdose.

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive anticholinergic and/or sedative effects; monitor

Index TermsBrompheniramine Maleate; Brompheniramine Tannate

Budesonide and Formoterol

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(byoo DES oh nide & for MOH te rol)

U.S. Brand NamesSymbicort®

Canadian Brand NamesSymbicort®

Pharmacologic CategoryBeta$_2$ Agonist; Beta$_2$ Agonist, Long-Acting; Corticosteroid, Inhalant (Oral)

Use: Labeled IndicationsTreatment of asthma in patients ≥12 years of age where combination therapy is indicated

Use: Unlabeled/InvestigationalTreatment of asthma in children 5-11 years of age where combination therapy is indicated

Dosing: Adults**Asthma:** Oral inhalation:

U.S. labeling: Symbicort® 80/4.5, Symbicort® 160/4.5: 2 inhalations twice daily. Patients currently receiving a low-to-medium dose inhaled corticosteroid may be started on the lower strength combination; those receiving a medium-to-high dose inhaled corticosteroid may be started on the higher strength combination. Consider the higher dose combination for patients not adequately controlled on the lower combination following 1-2 weeks of therapy. Do not use more than 2 inhalations twice daily of either strength.

Canadian labeling:

Symbicort® 100 Turbuhaler® [CAN; not available in U.S.], Symbicort® 200 Turbuhaler® [CAN; not available in U.S.]:

Initial: 1-2 inhalations twice daily until symptom control, then titrate to lowest effective dosage to maintain control

Maintenance: 1-2 inhalations once or twice daily (maximum: 8 inhalations/day as temporary treatment in periods of worsening asthma)

Symbicort® Maintenance and Reliever Therapy (Symbicort® SMART): **Note:** Not approved in the U.S.:

Maintenance: Symbicort® 100 Turbuhaler® [CAN] **or** Symbicort® 200 Turbuhaler® [CAN]: 1-2 inhalations twice daily **or** 2 inhalations once daily

Reliever therapy: Symbicort® 100 Turbuhaler [CAN] **or** Symbicort® 200 Turbuhaler® [CAN.]: 1 additional inhalation as needed, may repeat if no relief for up to 6 inhalations total (maximum: 8 inhalations/day)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Asthma:**Oral inhalation:

Children 5-11 years (NIH Guidelines): Symbicort® 80/4.5: 2 inhalations twice daily. Do not exceed 4 inhalations per day.

Children ≥12 years: Refer to adult dosing.

Administration: Inhalation

Symbicort® 80/4.5, Symbicort® 160/4.5: Prior to first use, inhaler must be primed by releasing 2 test sprays into the air; shake well for 5 seconds before each spray. Inhaler must be reprimed if not used for >7 days or if it has been dropped. Shake well for 5 seconds before each use. Discard inhaler after the labeled number of inhalations have been used or within 3 months after removal from foil pouch (do not use the “float test” to determine amount remaining in canister).

Symbicort® Turbuhaler® [CAN; not available in U.S.]:

To “load” inhaler: Turn grip on inhaler as far as it will move in one direction, then turn in opposite direction as far as it will go (inhaler is “loaded” with a dose, indicated by a “click”). Prior to first use, this procedure should be done twice, it does not need to be repeated with subsequent uses even when not used regularly.

Delivery of dose: Instruct patient to place mouthpiece gently between teeth, closing lips around inhaler. Instruct patient to inhale deeply and hold breath held for 5-10 seconds. The amount of drug delivered is small, and the individual will not sense the medication as it is inhaled. Remove mouthpiece prior to exhalation. Patient should not breathe out through the mouthpiece. After use of the inhaler, patient should rinse mouth/oropharynx with water and spit out rinse solution.

Storage

Symbicort® 80/4.5, Symbicort® 160/4.5: Store at room temperature of 20°C to 25°C (68°F to 77°F) with mouthpiece down. Discard inhaler after the labeled number of inhalations have been used or within 3 months after removal from foil pouch.

Symbicort® Turbuhaler®: Store at room temperature of 15°C to 30°C. Protect from heat and moisture.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to adrenergic amines, formoterol, budesonide, or any component of the formulation; need for acute bronchodilation (including status asthmaticus)

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Boxed warnings:

- Asthma-related deaths: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections. Do not use this product to transfer patients from oral corticosteroid therapy.

- Asthma-related deaths: **[U.S. Boxed Warning]: Long-acting beta$_2$-agonists may increase the risk of asthma-related deaths.** In a large, randomized clinical trial (SMART, 2006), salmeterol was associated with a small, but statistically significant increase in asthma-related deaths (when added to usual asthma therapy); risk may be greater in African-American patients versus Caucasians.

- Bone density: Long-term use may affect bone mineral density in adults.

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.

- Hypersensitivity reactions: Immediate hypersensitivity reactions (urticaria, angioedema, rash, bronchospasm) have been reported.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox should be avoided; corticosteroids should not be used to treat ocular herpes simplex. Corticosteroids should not be used for cerebral malaria. Close observation is required in patients with latent tuberculosis and/or TB reactivity. Restrict use in active TB (only in conjunction with antituberculosis treatment).

- Oral candidiasis: Infections with *Candida albicans* in the mouth and throat (thrush) have been reported with use.

- Serious effects/fatalities: Do not exceed recommended dose; serious adverse events, including fatalities, have been associated with excessive use of inhaled sympathomimetics.

Disease-related concerns:

- Asthma: Appropriate use: Should only be used as adjuvant therapy in patients not adequately controlled on other asthma-controller medications. Formoterol is generally not meant to relieve acute asthmatic symptoms or to relieve rapidly-deteriorating symptoms. Acute episodes should be treated with short-acting beta$_2$ agonist.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (arrhythmia or hypertension or HF); beta agonists may cause elevation in blood pressure, heart rate and result in CNS stimulation/excitation. Beta$_2$ agonists may also increase risk of arrhythmias.

- Diabetes: Use with caution in patients with diabetes mellitus; beta$_2$ agonists may increase serum glucose.

- Hypokalemia: Use with caution in patients with hypokalemia; beta$_2$ agonists may decrease serum potassium.

- Ocular disease: Use with caution in patients with cataracts and/or glaucoma; increased intraocular pressure, open-angle glaucoma, and cataracts have occurred with prolonged use. Consider routine eye exams in chronic users.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Seizure disorders: Use with caution in patients with seizure disorders; beta agonists may result in CNS stimulation/excitation.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Pediatrics: Orally-inhaled and intranasal corticosteroids may cause a reduction in growth velocity in pediatric patients (~1 centimeter per year [range 0.3-1.8 cm per year] and related to dose and duration of exposure). To minimize the systemic effects of orally-inhaled and intranasal corticosteroids, each patient should be titrated to the lowest effective dose. Growth should be routinely monitored in pediatric patients.

Dosage form specific issues:

- Lactose: Some products (available in Canada) contain lactose; very rare anaphylactic reactions have been reported in patients with severe milk protein allergy.

Other warnings/precautions:

- Discontinuation of therapy: Withdraw systemic therapy with gradual tapering of dose. There have been reports of systemic corticosteroid withdrawal symptoms (eg, joint/muscle pain, lassitude, depression) when withdrawing oral inhalation therapy.

- Patient information: Patients must be instructed to seek medical attention in cases where acute symptoms are not relieved by short-acting beta-agonist (not formoterol) or a previous level of response is diminished. Treatment must not be delayed. Patients using inhaled, short acting beta$_2$ agonists should be instructed to discontinue routine use of these medications prior to beginning treatment with Symbicort®; short acting agents should be reserved for symptomatic relief of acute symptoms. Patients should not use additional long-acting beta$_2$-adrenergic agonists.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic and embryocidal effects were observed in animal studies when administered by inhalation at doses less than the maximum equivalent human dose. Also see individual agents.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**Note:** Percentage of adverse events may be dose related; causation not established. Also see individual agents.

>10%:

Central nervous system: Headache (7% to 11%)

Respiratory: Nasopharyngitis (10% to 11%), upper respiratory tract infections (8% to 11%)

3% to 10%:

Gastrointestinal: Stomach discomfort (1% to 7%), oral candidiasis (1% to 3%), vomiting (1% to 3%)

Neuromuscular & skeletal: Back pain (2% to 3%)

Respiratory: Pharyngolaryngeal pain (6% to 9%), sinusitis (5% to 6%), bronchitis (<4%), cough (<4%), nasal congestion (3%), influenza (2% to 3%)

≥1% to <3%: Abdominal pain (upper), allergic rhinitis, arthralgia, asthma, bronchitis, diarrhea, dizziness, dyspepsia, dysphonia, gastroenteritis (viral), lower respiratory tract infection, migraine, muscle spasms, myalgia, nausea, pain (extremity), palpitation, pharyngitis, post procedural pain, pyrexia, rhinitis, sinus congestion, sinus headache, tension headache, tremor, urinary tract infection

<1%, postmarketing, and/or case reports: Agitation, anaphylaxis, anxiety, atrial arrhythmia, bronchospasm, bruising, cataract, coronary ischemia, depression, glaucoma, hyper-/hypocorticism symptoms, hyper-/hypotension, hyperglycemia, hypersensitivity reactions, hypertensive crisis, hypokalemia, irritability, nervousness, psychiatric symptoms (eg, aggression, behavioral disturbances, psychosis), restlessness, tachycardia, taste disturbance, ventricular arrhythmia

Metabolism/Transport Effects

Budesonide: **Substrate** (minor) of CYP3A4

Formoterol: **Substrate** (minor) of CYP2A6, 2C9, 2C19, 2D6

Drug Interactions

Alpha-/Beta-Blockers: May diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Amphotericin B: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Orally Inhaled) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Orally Inhaled). *Risk C: Monitor therapy*

Atomoxetine: May enhance the tachycardic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Betahistine: May diminish the therapeutic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Loop Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Corticosteroids (Orally Inhaled). *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Monitoring ParametersPeak flow meter and/or other pulmonary function tests; monitor growth in pediatric patients, symptom relief, monitor for increased use if short-acting beta$_2$-adrenergic agonists (may be a sign of asthma deterioration)

Monitoring: Lab TestsPeak flow meter; growth (in pediatric patients)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian product

Aerosol for oral inhalation:

Symbicort® 80/4.5: Budesonide 80 mcg and formoterol fumarate dihydrate 4.5 mcg per actuation (6.9 g) [60 metered inhalations]; budesonide 80 mcg and formoterol fumarate dihydrate 4.5 mcg per actuation (10.2 g) [120 metered inhalations]

Symbicort® 160/4.5: Budesonide 160 mcg and formoterol fumarate dihydrate 4.5 mcg per actuation (6 g) [60 metered inhalations]; budesonide 160 mcg and formoterol fumarate dihydrate 4.5 mcg per actuation (10.2 g) [120 metered inhalations]

Powder for oral inhalation:

Symbicort® 100 Turbuhaler® [CAN]: Budesonide 100 mcg and formoterol dihydrate 6 mcg per inhalation (available in 60 or 120 metered doses) [delivers ~80 mcg budesonide and 4.5 mcg formoterol per inhalation; contains lactose] [not available in the U.S]

Symbicort® 200 Turbuhaler® [CAN]: Budesonide 200 mcg and formoterol dihydrate 6 mcg per inhalation (available in 60 or 120 metered doses) [delivers ~160 mcg budesonide and 4.5 mcg formoterol per inhalation; contains lactose] [not available in the U.S]

Pricing: U.S. (www.drugstore.com)

Aerosol (Symbicort)

80-4.5 mcg/ACT (6.9): $114.09

80-4.5 mcg/ACT (10.2): $163.79

160-4.5 mcg/ACT (10.2): $192.73

Mechanism of ActionFormoterol relaxes bronchial smooth muscle by selective action on beta$_2$ receptors with little effect on heart rate. Formoterol has a long-acting effect. Budesonide is a corticosteroid which controls the rate of protein synthesis, depresses the migration of polymorphonuclear leukocytes/fibroblasts, reverses capillary permeability and lysosomal stabilization at the cellular level to prevent or control inflammation.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Budesonide
- Formoterol

Pharmacotherapy PearlsEffects of inhaled/intranasal steroids on growth have been observed in the absence of laboratory evidence of HPA axis suppression, suggesting that growth velocity is a more sensitive indicator of systemic corticosteroid exposure in pediatric patients than some commonly used tests of HPA axis function. The long-term effects of this reduction in growth velocity associated with orally-inhaled and intranasal corticosteroids, including the impact on final adult height, are unknown. The potential for “catch up” growth following discontinuation of treatment with inhaled corticosteroids has not been adequately studied.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Formoterol: Xerostomia (normal salivary flow resumes upon discontinuation). Localized infections with *Candida albicans* or *Aspergillus niger* have occurred frequently in the mouth and pharynx with repetitive use of oral inhaler of corticosteroids. These infections may require treatment with appropriate antifungal therapy or discontinuance of treatment with corticosteroid inhaler.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness, dizziness, or insomnia

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor treatment. Concurrent use with TCAs, pimozide, thioridazine, or mesoridazine may potentiate cardiovascular effects.

Index TermsBudesonide and Eformoterol; Eformoterol and Budesonide; Formoterol Fumarate Dihydrate and Budesonide

English English

Jump To Field (Select Field Name)

Pronunciation(byoo DES oh nide)

U.S. Brand NamesEntocort® EC; Pulmicort Flexhaler™; Pulmicort Respules®; Rhinocort® Aqua®

Canadian Brand NamesEntocort®; Gen-Budesonide AQ; Pulmicort®; Rhinocort® Aqua™; Rhinocort® Turbuhaler®

Pharmacologic CategoryCorticosteroid, Inhalant (Oral); Corticosteroid, Nasal; Corticosteroid, Systemic

Use: Labeled Indications

Intranasal: Management of symptoms of seasonal or perennial rhinitis

Canadian labeling: Additional use (not in U.S. labeling): Prevention and treatment of nasal polyps

Nebulization: Maintenance and prophylactic treatment of asthma

Oral capsule: Treatment of active Crohn's disease (mild-to-moderate) involving the ileum and/or ascending colon; maintenance of remission (for up to 3 months) of Crohn's disease (mild-to-moderate) involving the ileum and/or ascending colon

Oral inhalation: Maintenance and prophylactic treatment of asthma; includes patients who require oral corticosteroids and those who may benefit from systemic dose reduction/elimination

Dosing: Adults

Asthma:*Oral inhalation:*

Pulmicort Flexhaler™: Initial: 360 mcg twice daily (selected patients may be initiated at 180 mcg twice daily); maximum 720 mcg twice daily

NIH Asthma Guidelines (NIH, 2007) (administer in divided doses twice daily):

"Low" dose: 180-600 mcg/day

"Medium" dose: >600-1200 mcg/day

"High" dose: >1200 mcg/day

Pulmicort® Turbuhaler®: [CAN, not available in the U.S.]: Initial (during periods of severe asthma or when switching from oral corticosteroid therapy): 400-2400 mcg daily in 2-4 divided doses; Maintenance: 200-400 mcg twice daily (higher doses may be needed for short periods of time). **Note:** Patients taking 400 mcg/day may take as a single daily dose

Crohn's disease (active):*Oral:* 9 mg once daily in the morning for up to 8 weeks; recurring episodes may be treated with a repeat 8-week course of treatment. **Note:** Patients receiving CYP3A4 inhibitors should be monitored closely for signs and symptoms of hypercorticism; dosage reduction may be required. If switching from oral prednisolone, prednisolone dosage should be tapered while budesonide (Entocort™ EC) treatment is initiated.

Maintenance of remission: Following treatment of active disease (control of symptoms with CDAI <150), treatment may be continued at a dosage of 6 mg once daily for up to 3 months. If symptom control is maintained for 3 months, tapering of the dosage to complete cessation is recommended. Continued dosing beyond 3 months has not been demonstrated to result in substantial benefit.

Nasal polyps:*Nasal inhalation:*

Canadian labeling:

Rhinocort® Aqua®: 256 mcg/day administered as a single 64 mcg spray in each nostril twice daily; maximum dose: 256 mcg/day

Rhinocort® Turbuhaler®: 100 mcg into each nostril twice daily; maximum: 400 mcg/day

Rhinitis:*Nasal inhalation:*

U.S. labeling (Rhinocort® Aqua®): 64 mcg/day as a single 32 mcg spray in each nostril. Some patients who do not achieve adequate control may benefit from increased dosage. A reduced dosage may be effective after initial control is achieved

Maximum dose: Children <12 years: 128 mcg/day; Adults: 256 mcg/day)

Canadian labeling:

Rhinocort® Aqua®: Initial: 256 mcg/day administered as two 64 mcg sprays in each nostril once daily or a single 64 mcg spray in each nostril twice daily; Maintenance: Individualize, lowest effective dose (maximum dose: 256 mcg/day)

Rhinocort® Turbuhaler®: Initial: 200 mcg into each nostril once daily; Maintenance: Individualize, lowest effective dose (maximum: 400 mcg/day)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Asthma:

Oral inhalation:

Pulmicort Flexhaler™: ≥6 years: Initial: 180 mcg twice daily (some patients may be initiated at 360 mcg twice daily); maximum 360 mcg twice daily

NIH Asthma Guidelines (NIH, 2007) (administer in divided doses twice daily):

Children 5-11 years:

“Low” dose: 180-400 mcg/day

“Medium” dose: >400-800 mcg/day

“High” dose: >800 mcg/day

Children ≥12 years: Refer to adult dosing.

Pulmicort® Turbuhaler®: [CAN, not available in the U.S.]: Initial (during periods of severe asthma or when switching from oral corticosteroid therapy): 200-400 mcg daily in 2 divided doses; Maintenance: Individualized, lowest effective dose.

Nebulization: Children 12 months to 8 years: Pulmicort Respules®: Titrate to lowest effective dose once patient is stable; start at 0.25 mg/day or use as follows:

Previous therapy of bronchodilators alone: 0.5 mg/day administered as a single dose or divided twice daily (maximum daily dose: 0.5 mg)

Previous therapy of inhaled corticosteroids: 0.5 mg/day administered as a single dose or divided twice daily (maximum daily dose: 1 mg)

Previous therapy of oral corticosteroids: 1 mg/day administered as a single dose or divided twice daily (maximum daily dose: 1 mg)

NIH Asthma Guidelines (NIH, 2007):

Children 0-4 years:

“Low” dose: 0.25-0.5 mg/day

“Medium” dose: >0.5-1 mg/day

“High” dose: >1 mg/day

Children 5-11 years:

“Low” dose: 0.5 mg/day

“Medium” dose: 1 mg/day

“High” dose: 2 mg/day

Nasal polyps:*Nasal inhalation:*

Canadian labeling: Children ≥6 years: Refer to adult dosing.

Rhinitis:*Nasal inhalation:*

U.S. labeling (Rhinocort® Aqua®): Children ≥6 years: Refer to adult dosing.

Canadian labeling (Rhinocort® Aqua®, Rhinocort® Turbuhaler®): Children ≥6 years: Refer to adult dosing.

Dosing: Hepatic ImpairmentMonitor closely for signs and symptoms of hypercorticism; dosage reduction may be required.

Administration: OralOral capsule: Capsule should be swallowed whole; do not crush or chew.

Administration: Inhalation

Powder for inhalation:

Pulmicort Flexhaler™: Hold inhaler in upright position (mouthpiece up) to load dose. Do not shake prior to use. Unit should be primed prior to first use only. It will not need primed again, even if not used for a long time. Place mouthpiece between lips and inhale forcefully and deeply. Do not exhale through inhaler; do not use a spacer. Dose indicator does not move with every dose, usually only after 5 doses. Discard when dose indicator reads “0”. Rinse mouth with water after each use to reduce incidence of candidiasis.

Pulmicort Turbuhaler® [CAN, not available in the U.S.]: Hold inhaler in upright position (mouthpiece up) to load dose. Do not shake inhaler after dose is loaded. Unit should be primed prior to first use. Place mouthpiece between lips and inhale forcefully and deeply; mouthpiece should face up. Do not exhale through inhaler; do not use a spacer. When a red mark appears in the dose indicator window, 20 doses are left. When the red mark reaches the bottom of the window, the inhaler should be discarded. Rinse mouth with water after use to reduce incidence of candidiasis.

Rhinocort® Turbuhaler® [CAN, not available in the U.S.]: Hold inhaler in upright position and turn grey grip as far as it will go in one direction and then back to original position. Clicking sound means inhaler is loaded with dose and ready for use. Place nasal adapter into nostril and ensure firm fit. Cover opposite nostril with finger and inhale (sniff) quickly and forcefully. Do not exhale through inhaler. When a red mark appears in the dose indicator window, 20 doses are left. When the red mark reaches the bottom of the window, the inhaler should be discarded

Suspension for nebulization: Shake well before using. Use Pulmicort Respules® with jet nebulizer connected to an air compressor; administer with mouthpiece or facemask. Do not use ultrasonic nebulizer. Do not mix with other medications in nebulizer. Rinse mouth following treatments to decrease risk of oral candidiasis (wash face if using face mask).

Suspension for nasal inhalation: Shake gently before use. Prime before first use; discard after 120 sprays.

Dietary Considerations Avoid grapefruit juice when using oral capsules.

Storage

Suspension for nebulization: Store upright at 20°C to 25°C (68°F to 77°F). Protect from light. Do not refrigerate or freeze. Once aluminum package is opened, solution should be used within 2 weeks. Continue to protect from light.

Nasal inhaler: Store with valve up at 15°C to 30°C (59°F to 86°F). Protect from high humidity.

Nasal spray: Store with valve up at 20°C to 25°C (68°F to 77°F); do not freeze. Protect from light.

Oral inhaler (Pulmicort Flexhaler™): Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from moisture.

Contraindications Hypersensitivity to budesonide or any component of the formulation

Inhalation: Contraindicated in primary treatment of status asthmaticus, acute episodes of asthma; not for relief of acute bronchospasm

Canadian labeling: Additional contraindications (not in U.S. labeling): Moderate-to-severe bronchiectasis, pulmonary tuberculosis (active or quiescent), untreated respiratory infection (bacterial, fungal, or viral); use of Rhinocort® Aqua™ and Rhinocort® Turbuhaler® in patients <6 years of age

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections. Do not use this product to transfer patients directly from oral corticosteroid therapy.

- Bronchospasm: May occur with wheezing after inhalation; if this occurs stop steroid and treat with a fast-acting bronchodilator (eg, albuterol).

- Delayed wound healing: Avoid nasal corticosteroid use in patients with recent nasal septal ulcers, nasal surgery or nasal trauma until healing has occurred.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox should be avoided; corticosteroids should not be used to treat ocular herpes simplex. Corticosteroids should not be used for cerebral malaria or viral hepatitis. Close observation is required in patients with latent tuberculosis and/or TB reactivity restrict use in active TB (only in conjunction with antituberculosis treatment).

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Local oral infections: *Candida albicans* infections may occur in the mouth and pharynx; rinsing (and spitting) with water after inhaler use may decrease risk.

- Myopathy: Acute myopathy has been reported with high-dose corticosteroids, usually in patients with neuromuscular transmission disorders; may involve ocular and/or respiratory muscles; monitor creatine kinase; recovery may be delayed.

- Psychiatric disturbances: Corticosteroid use may cause psychiatric disturbances, including depression, euphoria, insomnia, mood swings, and personality changes. Pre-existing psychiatric conditions may be exacerbated by corticosteroid use.

Disease-related concerns:

- Asthma: Supplemental steroids (oral or parenteral) may be needed during stress or severe asthma attacks. Not to be used in status asthmaticus or for the relief of acute bronchospasm.

- Cardiovascular disease: Use with caution in patients with HF or hypertension; long-term use has been associated with fluid retention and hypertension.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose production/regulation leading to hyperglycemia.

- Gastrointestinal disease: Use with caution in patients with GI diseases (diverticulitis, peptic ulcer, ulcerative colitis) due to perforation risk.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including cirrhosis; long-term use has been associated with fluid retention.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms has occurred especially during initial treatment with corticosteroids.

- Myocardial infarct (MI): Use with caution following acute MI; corticosteroids have been associated with myocardial rupture.

- Ocular disease: Use with caution in patients with cataracts and/or glaucoma; increased intraocular pressure, open-angle glaucoma, and cataracts have occurred with prolonged use. Consider routine eye exams in chronic users.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Renal impairment: Use with caution in patients with renal impairment; fluid retention may occur.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Elderly: Because of the risk of adverse effects, systemic corticosteroids should be used cautiously in the elderly in the smallest possible effective dose for the shortest duration.

- Pediatrics: Orally-inhaled and intranasal corticosteroids may cause a reduction in growth velocity in pediatric patients (~1 centimeter per year [range 0.3-1.8 cm per year] and related to dose and duration of exposure). To minimize the systemic effects of orally-inhaled and intranasal corticosteroids, each patient should be titrated to the lowest effective dose. Growth should be routinely monitored in pediatric patients.

Dosage form specific issues:

- Lactose: Pulmicort Flexhaler™ contains lactose; very rare anaphylactic reactions have been reported in patients with severe milk protein allergy.

Other warnings/precautions:

- Discontinuation of therapy: Withdraw systemic therapy with gradual tapering of dose. There have been reports of systemic corticosteroid withdrawal symptoms (eg, joint/muscle pain, lassitude, depression) when withdrawing oral inhalation therapy.

Geriatric ConsiderationsEnsure that patients can correctly use nasal inhaler.
Pregnancy Risk FactorC (capsule)/B (inhalation)
Pregnancy ConsiderationsAdverse events have been observed with corticosteroids in animal reproduction studies. Studies of pregnant women using inhaled budesonide have not demonstrated an increased risk of abnormalities. Some studies have shown an association between first trimester systemic corticosteroid use and oral clefts; adverse events in the fetus/neonate have been noted in case reports following large doses of systemic corticosteroids during pregnancy. Budesonide is the preferred inhaled corticosteroid for the treatment of asthma in pregnant women.
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsFollowing use of the powder for oral inhalation, ~0.3% to 1% of the maternal dose was found in breast milk. The maximum concentration appeared within 45 minutes of dosing. Plasma budesonide levels obtained from infants ~90 minutes after breast-feeding (~140 minutes after maternal dose) were below the limit of quantification.
Adverse ReactionsReaction severity varies by dose and duration; not all adverse reactions have been reported with each dosage form.
>10%:

Central nervous system: Headache (≤21%)

Gastrointestinal: Nausea (≤11%)

Respiratory: Respiratory infection, rhinitis

Miscellaneous: Symptoms of HPA axis suppression and/or hypercorticism may occur in >10% of patients following administration of dosage forms which result in higher systemic exposure (ie, oral capsule), but may be less frequent than rates observed with comparator drugs (prednisolone). These symptoms may be rare (<1%) following administration via methods which result in lower exposures (topical).

1% to 10%:

Cardiovascular: Chest pain, edema, flushing, hypertension, palpitation, syncope, tachycardia

Central nervous system: Dizziness, dysphonia, emotional lability, fatigue, fever, insomnia, migraine, nervousness, pain, vertigo

Dermatologic: Acne, alopecia, bruising, contact dermatitis, eczema, hirsutism, pruritus, pustular rash, rash, striae

Endocrine & metabolic: Adrenal insufficiency, hypokalemia, menstrual disorder

Gastrointestinal: Abdominal pain, anorexia, diarrhea, dyspepsia, flatulence, gastroenteritis (including viral), oral candidiasis, taste perversion, vomiting, weight gain, xerostomia

Genitourinary: Dysuria, hematuria, nocturia, pyuria

Hematologic: Cervical lymphadenopathy, leukocytosis, purpura

Hepatic: Alkaline phosphatase increased

Neuromuscular & skeletal: Arthralgia, back pain, fracture, hyperkinesis, hypertonia, myalgia, neck pain, paresthesia, weakness

Ocular: Conjunctivitis, eye infection

Otic: Earache, ear infection, external ear infection

Respiratory: Bronchitis, bronchospasm, cough, epistaxis, hoarseness, nasal congestion, nasal irritation, pharyngitis, sinusitis, stridor, throat irritation

Miscellaneous: Abscess, allergic reaction, C-reactive protein increased, erythrocyte sedimentation rate increased, fat distribution (moon face, buffalo hump); flu-like syndrome, herpes simplex, infection, moniliasis, viral infection, voice alteration

<1%, postmarketing, and/or case reports: Aggressive reactions, alopecia, angioedema, anxiety, avascular necrosis of the femoral head, benign intracranial hypertension, bone mineral density decreased, cataracts, depression, dyspnea, glaucoma, growth suppression, hypersensitivity reactions (immediate and delayed [includes rash, contact dermatitis, angioedema, bronchospasm]), hypocorticism, intermenstrual bleeding, irritability, nasal septum perforation, osteoporosis, psychosis, somnolence, urticaria, wheezing (patients with severe milk allergy)

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)
Drug Interactions

Amphotericin B: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Orally Inhaled) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Orally Inhaled). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Corticosteroids (Orally Inhaled). *Risk D: Consider therapy modification*

Thiazide Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Grapefruit juice may double systemic exposure of orally-administered budesonide. Administration of capsules with a high-fat meal delays peak concentration, but does not alter the extent of absorption.
Monitoring ParametersMonitor growth in pediatric patients; blood pressure, serum glucose, weight with high-dose or long-term oral use

Asthma: FEV_1, peak flow, and/or other pulmonary function tests

Nursing: Physical Assessment/MonitoringMonitor therapeutic effectiveness and adverse reactions. When changing from systemic steroids to inhalational steroids, taper reduction of systemic medication slowly (may take several months). Growth should be routinely monitored in pediatric patients. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Patient EducationUse as directed; do not increase dosage or discontinue abruptly without consulting prescriber. May take 1-2 weeks or longer before full effects are seen. Avoid grapefruit juice while taking this medication. May be more susceptible to infection; avoid exposure to chickenpox and measles unless immunity has been established. If exposure to measles or chickenpox occurs, notify your prescriber immediately. Report acute nervousness or inability to sleep; severe sneezing or nosebleed; respiratory difficulty, sore throat, hoarseness, bronchitis, or bronchospasms; disturbed menstrual pattern; vision changes; loss of taste or smell perception; or worsening of condition or lack of improvement. Regular eye exams should be considered with long-term use (risk of cataracts or glaucoma). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Oral capsule: Swallow whole; do not crush or chew capsule.

Inhalation/nebulization: This is not a bronchodilator and will not relieve acute asthma attacks. It may take several days for you to realize full effects of treatment. If you are also using an inhaled bronchodilator, wait 10 minutes before using this steroid aerosol. Take 5-10 deep breaths. Use inhaler on inspiration. Hold breath for 5-10 seconds after inhalation. Allow 1 full minute between inhalations. You may experience dizziness, anxiety, or blurred vision (rise slowly from sitting or lying position and use caution when driving or engaging in tasks requiring alertness until response to drug is known); or taste disturbance or aftertaste (frequent mouth care and mouth rinses may help). Rinse mouth with water following oral treatments to decrease risk of oral candidiasis (wash face if using a face mask).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name; [DSC] = Discontinued product

Capsule, enteric coated:

Entocort® EC: 3 mg

Powder for nasal inhalation:

Rhinocort® Turbuhaler® [CAN]: 100 mcg/inhalation [delivers 200 metered actuations] [not available in the U.S.]

Powder for oral inhalation:

Pulmicort Flexhaler™: 90 mcg/inhalation (165 mg) [contains lactose; delivers ~80 mcg/inhalation; 60 actuations]

Pulmicort Flexhaler™: 180 mcg/inhalation (225 mg) [contains lactose; delivers ~160 mcg/inhalation; 120 actuations]

Pulmicort Turbuhaler® [CAN]: 100 mcg/inhalation [delivers 200 metered actuations]; 200 mcg/inhalation [delivers 200 metered actuations]; 400 mcg/inhalation [delivers 200 metered actuations] [not available in the U.S.]

Suspension, intranasal [spray]:

Rhinocort® Aqua®: 32 mcg/inhalation (8.6 g) [120 metered actuations]

Rhinocort® Aqua® [CAN]: 64 mcg/inhalation [120 metered actuations] [not available in the U.S.]

Suspension for nebulization:

Pulmicort Respules®: 0.25 mg/2 mL (2 mL); 0.5 mg/2 mL (2 mL); 1 mg/2 mL (2 mL)

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Entocort EC)

3 mg (30): $190.73

Inhalation (Pulmicort Flexhaler)

90 mcg/ACT (1): $99.84

180 mcg/ACT (1): $132.35

Suspension (Pulmicort)

0.25 mg/2 mL (60): $176.96

0.5 mg/2 mL (60): $208.12

Suspension (Rhinocort Aqua)

32 mcg/ACT (8.6): $101.55

Mechanism of ActionControls the rate of protein synthesis; depresses the migration of polymorphonuclear leukocytes, fibroblasts; reverses capillary permeability and lysosomal stabilization at the cellular level to prevent or control inflammation. Has potent glucocorticoid activity and weak mineralocorticoid activity.

Pharmacodynamics/Kinetics

Onset of action: Pulmicort Respules®: 2-8 days; Rhinocort® Aqua®: ~10 hours; Inhalation: 24 hours

Peak effect: Pulmicort Respules®: 4-6 weeks; Rhinocort® Aqua®: ~2 weeks; Inhalation: 1-2 weeks

Distribution: 2.2-3.9 L/kg

Protein binding: 85% to 90%

Metabolism: Hepatic via CYP3A4 to two metabolites: 16 alpha-hydroxyprednisolone and 6 beta-hydroxybudesonide; minor activity

Bioavailability: Limited by high first-pass effect; Capsule: 9% to 21%; Pulmicort Respules®: 6%; Inhalation: 6% to 13%; Nasal: 34%

Half-life elimination: 2-3.6 hours

Time to peak: Capsule: 0.5-10 hours (variable in Crohn's disease); Pulmicort Respules®: 10-30 minutes; Inhalation: 1-2 hours; Nasal: 1 hour

Excretion: Urine (60%) and feces as metabolites

Related Information

- Asthma
- Inhalant Agents
- Status Epilepticus

Pharmacotherapy PearlsEffects of inhaled/intranasal steroids on growth have been observed in the absence of laboratory evidence of HPA axis suppression, suggesting that growth velocity is a more sensitive indicator of systemic corticosteroid exposure in pediatric patients than some commonly used tests of HPA axis function. The long-term effects of this reduction in growth velocity associated with orally-inhaled and intranasal corticosteroids, including the impact on final adult height, are unknown. The potential for “catch up” growth following discontinuation of treatment with inhaled corticosteroids has not been adequately studied.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), dry throat, abnormal taste, and herpes simplex. Localized infections with *Candida albicans* or *Aspergillus niger* have occurred frequently in the mouth and pharynx with repetitive use of oral inhaler of corticosteroids. These infections may require treatment with appropriate antifungal therapy or discontinuance of treatment with corticosteroid inhaler.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness and insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other Considerations

Surgery: For patients who have received oral systemic corticosteroids during the past 6 months and for selected patients on long-term, high-dose, inhaled corticosteroid (ICS), give stress doses of hydrocortisone intravenously during the surgical period and reduce the dose rapidly within 24 hours after surgery (Expert Panel Report 3, 2007). Clinically important adrenal suppression has been reported in patients receiving high doses of an ICS, particularly children.

Bumetanide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Bumetanide may be confused with Buminate®

Bumex® may be confused with Brevibloc®, Buprenex®, Permax®

Pronunciation(byoo MET a nide)

U.S. Brand NamesBumex®

Canadian Brand NamesBumex®; Burinex®

Pharmacologic CategoryDiuretic, Loop

Use: Labeled IndicationsManagement of edema secondary to congestive heart failure or hepatic or renal disease including nephrotic syndrome; may be used alone or in combination with antihypertensives in the treatment of hypertension; can be used in furosemide-allergic patients

Dosing: Adults

Edema:

Oral: 0.5-2 mg/dose (maximum dose: 10 mg/day) 1-2 times/day

I.M., I.V.: 0.5-1 mg/dose; may repeat in 2-3 hours for up to 2 doses if needed (maximum dose: 10 mg/day)

Continuous I.V. infusion: Initial: 1 mg load then 0.5-2 mg/hour (ACC/AHA 2005 practice guidelines for chronic heart failure)

Hypertension: Oral: 0.5 mg daily (maximum dose: 5 mg/day)

Usual dosage range (JNC 7): 0.5-2 mg/day in 2 divided doses

Dosing: ElderlyInitial: Oral: 0.5 mg once daily, increase as necessary.

Dosing: PediatricEdema (diuresis): Oral, I.M., I.V.:

Neonates (see Warnings/Precautions): 0.01-0.05 mg/kg/dose every 24-48 hours

Infants and Children: 0.015-0.1 mg/kg/dose every 6-24 hours (maximum dose: 10 mg/day)

Administration: I.V.Administer I.V. slowly, over 1-2 minutes. An alternate-day schedule or a 3-4 daily dosing regimen with rest periods of 1-2 days in between may be the most tolerable and effective regimen for the continued control of edema. Reserve I.V. administration for those unable to take oral medications.

Administration: I.V. DetailpH: 6.8-7.8 (adjusted)

Dietary ConsiderationsMay require increased intake of potassium-rich foods.

Storage

I.V.: Store vials at 15°C to 30°C (59°F to 86°F). Infusion solutions should be used within 24 hours after preparation. Light sensitive; discoloration may occur when exposed to light.

Tablet: Store at 15°C to 30°C (59°F to 86°F).

CompatibilityStable in D_5W, NS, LR.

Y-site administration: Compatible: Allopurinol, amifostine, aztreonam, cefepime, cisatracurium, cladribine, clarithromycin, diltiazem, docetaxel, etoposide, filgrastim, gemcitabine, granisetron, lorazepam, melphalan, meperidine, milrinone, morphine, piperacillin/tazobactam, propofol, remifentanil, teniposide, thiotepa, vinorelbine. **Incompatible:** Midazolam.

Compatibility in syringe: Compatible: Doxapram.

Compatibility when admixed: Compatible: Floxacillin, furosemide. **Incompatible:** Dobutamine, milrinone.

ContraindicationsHypersensitivity to bumetanide, any component of the formulation, or sulfonylureas; anuria; patients with hepatic coma or in states of severe electrolyte depletion until the condition improves or is corrected; pregnancy (based on expert analysis)

Allergy Considerations

- Loop Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Fluid/electrolyte loss: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Fluid/electrolyte loss: **[U.S. Boxed Warning]: Loop diuretics are potent diuretics; excess amounts can lead to profound diuresis with fluid and electrolyte loss; close medical supervision and dose evaluation are required.** Watch for and correct electrolyte disturbances; adjust dose to avoid dehydration.

- Hyperuricemia: Asymptomatic hyperuricemia has been reported with use.

- Nephrotoxicity: Monitor fluid status and renal function in an attempt to prevent oliguria, azotemia, and reversible increases in BUN and creatinine; close medical supervision of aggressive diuresis required.

- Ototoxicity: Rapid I.V. administration, renal impairment, excessive doses, and concurrent use of other ototoxins is associated with ototoxicity.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonylurea allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Cirrhosis: In cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

Concurrent drug therapy issues:

- Antihypertensives: Coadministration of antihypertensives may increase the risk of hypotension.

Special populations:

- Neonates: *In vitro* studies using pooled sera from critically-ill neonates have shown bumetanide to be a potent displacer of bilirubin; avoid use in neonates at risk for kernicterus.

Geriatric ConsiderationsLoop diuretics are potent diuretics; excess amounts can lead to profound diuresis with fluid and electrolyte loss; close medical supervision and dose evaluation is required, particularly in the elderly. Severe loss of sodium and/or increases in BUN can cause confusion; for any change in mental status in patients on bumetanide, monitor electrolytes and renal function.

Pregnancy Risk FactorC (manufacturer); D (expert analysis)

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Endocrine & metabolic: Hyperuricemia (18%), hypochloremia (15%), hypokalemia (15%)

Renal: Azotemia (11%)

1% to 10%:

Central nervous system: Dizziness (1%)

Endocrine & metabolic: Hyponatremia (9%); hyperglycemia (7%); variations in phosphorus (5%), CO_2 content (4%), bicarbonate (3%), and calcium (2%)

Neuromuscular & skeletal: Muscle cramps (1%)

Otic: Ototoxicity (1%)

Renal: Serum creatinine increased (7%)

<1% (Limited to important or life-threatening): Hypotension, orthostatic hypotension, headache, nausea, encephalopathy (in patients with pre-existing liver disease), hearing impaired, pruritus, weakness, hives, abdominal pain, arthritic pain, musculoskeletal pain, rash, vomiting, vertigo, chest pain, ear discomfort, fatigue, dehydration, diaphoresis, hyperventilation, dry mouth, upset stomach, renal failure, asterixis, itching, nipple tenderness, diarrhea, premature ejaculation, hypernatremia

Drug Interactions

ACE Inhibitors: Loop Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Loop Diuretics may enhance the adverse/toxic effect of Allopurinol. Loop Diuretics may increase the serum concentration of Allopurinol. Specifically, Loop Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoglycosides: Loop Diuretics may enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Loop Diuretics. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dofetilide: Loop Diuretics may enhance the QTc-prolonging effect of Dofetilide. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Loop Diuretics may diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Loop Diuretics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Phenytoin: May diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid dong quai if using for hypertension (has estrogenic activity). Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure, serum electrolytes, renal function

Nursing: Physical Assessment/MonitoringAssess history of allergies, renal, electrolyte, hepatic, and pregnancy status prior to beginning treatment. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, increased risk of hyperglycemia, hypotension, arrhythmias, ototoxicity). Blood pressure, weight, and fluid status should be monitored at beginning of therapy and periodically during therapy. Glucose levels for patients with diabetes should be monitored closely (glucose tolerance may be decreased by loop diuretics, requiring adjustment of hypoglycemic agents). Assess results of laboratory tests (electrolytes and renal function), therapeutic effectiveness (reduced edema and cardiopulmonary symptoms), and adverse effects (hypotension, electrolyte imbalance, ototoxicity). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum electrolytes, renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. May be taken with food to reduce GI effects. If taking one dose daily, take single dose early in day; if taking twice daily, take last dose early in afternoon to prevent sleep interruptions. Include orange juice or bananas (or other sources of potassium-rich foods) in your daily diet, but do not take supplemental potassium without consulting prescriber. If you have diabetes, monitor glucose levels closely (glucose tolerance may be decreased by loop diuretics), and notify prescriber of noted changes (hypoglycemic agent may need to be adjusted). May cause dizziness, hypotension, lightheadedness, or weakness (use caution when changing position from sitting or lying position, when driving, exercising, climbing stairs, or performing hazardous tasks until response to drug is known). Report palpitations or chest pain; swelling of ankles or feet; weight increase or decrease (>3 lb in any one day); increased fatigue, muscle cramps, or trembling; and any changes in hearing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant; contraceptives may be recommended. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution: 0.25 mg/mL (2 mL, 4 mL, 10 mL)

Tablet: 0.5 mg, 1 mg, 2 mg

Bumex®: 0.5 mg [DSC]; 1 mg; 2 mg [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Bumetanide)

2 mg (100): $82.39

Mechanism of ActionInhibits reabsorption of sodium and chloride in the ascending loop of Henle and proximal renal tubule, interfering with the chloride-binding cotransport system, thus causing increased excretion of water, sodium, chloride, magnesium, phosphate, and calcium; it does not appear to act on the distal tubule

Pharmacodynamics/Kinetics

Onset of action: Oral, I.M.: 0.5-1 hour; I.V.: 2-3 minutes

Duration: 4-6 hours

Distribution: V_d: 13-25 L/kg

Protein binding: 95%

Metabolism: Partially hepatic

Half-life elimination: Neonates: ~6 hours; Infants (1 month): ~2.4 hours; Adults: 1-1.5 hours

Excretion: Primarily urine (as unchanged drug and metabolites)

Related Information

- Heart Failure (Systolic)
- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness
Mental Health: Effects on Psychiatric TreatmentLithium excretion may be decreased; monitor serum lithium levels
Cardiovascular ConsiderationsIt is important that patients be closely followed for hypokalemia, hypomagnesemia, and volume depletion because of significant diuresis.
Anesthesia and Critical Care Concerns/Other ConsiderationsIf given the morning of surgery, it may render the patient volume depleted and blood pressure may be labile during general anesthesia.

Patients with impaired hepatic function must be monitored carefully, often requiring reduced doses. Larger doses may be necessary in patients with impaired renal function to obtain the same therapeutic response.

It is important that patients be closely followed for hypokalemia, hypomagnesemia, and volume depletion because of significant diuresis.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (epidural administration) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(byoo PIV a kane & ep i NEF rin)

U.S. Brand NamesMarcaine® with Epinephrine; Sensorcaine® with Epinephrine; Sensorcaine®-MPF with Epinephrine; Vivacaine™

Canadian Brand NamesSensorcaine® with Epinephrine

Pharmacologic CategoryLocal Anesthetic

Use: Labeled IndicationsLocal anesthetic (injectable) for peripheral nerve block, infiltration, sympathetic block, caudal or epidural block, retrobulbar block

Use: DentalLocal anesthesia

Dosing: AdultsDose varies with procedure, depth of anesthesia, vascularity of tissues, duration of anesthesia, and condition of patient. Do not use solutions containing preservatives for caudal or epidural block.

Caudal block (preservative free): 15-30 mL of 0.25% or 0.5%

Epidural block (other than caudal block, preservative free): 10-20 mL of 0.25% or 0.5%. Administer in 3-5 mL increments, allowing sufficient time to detect toxic manifestations of inadvertent I.V. or I.T. administration.

Surgical procedures requiring a high degree of muscle relaxation and prolonged effects only: 10-20 mL of 0.75% (**Note:** Not to be used in obstetrical cases)

Local anesthesia: Infiltration: 0.25% infiltrated locally (maximum: 175 mg of bupivacaine)

Peripheral nerve block: 5 mL of 0.25 or 0.5% (maximum: 400 mg/day of bupivacaine)

Retrobulbar anesthesia: 2-4 mL of 0.75%

Sympathetic nerve block: 20-50 mL of 0.25%

Infiltration and nerve block in maxillary and mandibular area: 9 mg (1.8 mL) of bupivacaine as a 0.5% solution with epinephrine 1:200,000 per injection site. A second dose may be administered if necessary to produce adequate anesthesia after allowing up to 10 minutes for onset. Up to a maximum of 90 mg of bupivacaine hydrochloride per dental appointment. The effective anesthetic dose varies with procedure, intensity of anesthesia needed, duration of anesthesia required, and physical condition of the patient; always use the lowest effective dose along with careful aspiration.

The following numbers of dental carpules (1.8 mL) provide the indicated amounts of bupivacaine hydrochloride 0.5% and vasoconstrictor (epinephrine 1:200,000). See table.

# of Cartridges (1.8 mL)	Mg Bupivacaine (0.5%)	Mg Vasoconstrictor (Epinephrine 1:200,000)
1	9	0.009
2	18	0.018
3	27	0.027
4	36	0.036
5	45	0.045
6	54	0.054
7	63	0.063

8	72	0.072
9	81	0.081
10	90	0.090

Note: Adult and children doses of bupivacaine hydrochloride with epinephrine cited from USP Dispensing Information (USP DI), 17th ed, The United States Pharmacopeial Convention, Inc, Rockville, MD, 1997, 134.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Children >12 years: Refer to adult dosing.

Administration: I.V. DetailpH: 3:3-5.5
StorageStore at controlled room temperature of 15°C to 30°C (59° to 86°F) and protect from light. Do not autoclave.
ContraindicationsHypersensitivity to bupivacaine, epinephrine, amide-type local anesthetics, or any component of the formulation
Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Boxed warnings:

- Obstetrical anesthesia: See “Dosage form specific issues” below.

Concerns related to adverse effects:

- Respiratory arrest: Local anesthetics have been associated with rare occurrences of sudden respiratory arrest, especially when administered near the head or neck.
- Seizures: Convulsions due to systemic toxicity leading to cardiac arrest have also been reported, presumably following unintentional intravascular injection or administration near the head or neck.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease or compromised blood supply.
- Hepatic impairment: Use with caution in patients with hepatic impairment.

Special populations:

- Acutely ill patients: Use with caution in acutely ill patients; dose reduction may be required.
- Debilitated patients: Use with caution in debilitated patients; dose reduction may be required.
- Elderly: Use with caution in the elderly; dose reduction may be required.
- Pediatrics: Not recommended for use in children <12 years of age.

Dosage form specific issues:

- Obstetrical anesthesia: **[U.S. Boxed Warning]: The 0.75% is not recommended for obstetrical anesthesia.**
- Preservative-containing solutions: Do not use solutions containing preservatives for caudal or epidural block.
- Sodium metabisulfite: Some commercially available formulations contain sodium metabisulfite, which may cause allergic-type reactions.

Other warnings/precautions:

- Administration: Intravascular injections should be avoided; aspiration should be performed prior to administration; the needle must be repositioned until no return of blood can be elicited by aspiration; however, absence of blood in the syringe does not guarantee that intravascular injection has been avoided.
- Test dose: A test dose is recommended prior to epidural administration (prior to initial dose) and all reinforcing doses with continuous catheter technique.
- Trained personnel: Dental practitioners and/or clinicians using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorC
Pregnancy ConsiderationsSee individual agents.
LactationEnters breast milk/not recommended
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsBupivacaine: **Substrate** (minor) of CYP1A2, 2C19, 2D6, 3A4

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. *Risk D: Consider therapy modification*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

COMT Inhibitors: May decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

Inhalational Anesthetics: May enhance the arrhythmogenic effect of EPINEPHrine. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). *Risk D: Consider therapy modification*

Monitoring Parameters

Vital signs, state of consciousness; signs of CNS toxicity; fetal heart rate during paracervical anesthesia

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: Bupivacaine hydrochloride 0.25% and epinephrine bitartrate 1:200,000 (10 mL, 30 mL); bupivacaine hydrochloride 0.5% and epinephrine bitartrate 1:200,000 (1.8 mL, 10 mL, 30 mL)

> Marcaine® with Epinephrine: Bupivacaine hydrochloride 0.25% and epinephrine bitartrate 1:200,000 (10 mL, 30 mL) [contains edetate calcium disodium and sodium metabisulfite]; bupivacaine hydrochloride 0.5% and epinephrine bitartrate 1:200,000 (1.8 mL, 3 mL, 10 mL, 30 mL) [contains edetate calcium disodium and sodium metabisulfite]; bupivacaine hydrochloride 0.75% and epinephrine bitartrate 1:200,000 (30 mL) [contains edetate calcium disodiam and sodium metabisulfite]
>
> Sensorcaine® MPF with Epinephrine: Bupivacaine hydrochloride 0.25% and epinephrine bitartrate 1:200,000 (10 mL, 30 mL) [contains sodium metabisulfite]; bupivacaine hydrochloride 0.5% and epinephrine bitartrate 1:200,000 (10 mL, 30 mL) [contains sodium metabisulfite]
>
> Vivacaine™: Bupivacaine hydrochloride 0.5% and epinephrine bitartrate 1:200,000 (1.8 mL) [contains edetate calcium disodium, sodium metabisulfite]

Injection, solution: Bupivacaine hydrochloride 0.25% and epinephrine bitartrate 1:200,000 (50 mL); bupivacaine hydrochloride 0.5% and epinephrine bitartrate 1:200,000 (50 mL)

> Marcaine® with Epinephrine: Bupivacaine hydrochloride 0.25% and epinephrine bitartrate 1:200,000 (50 mL) [contains methylparaben, edetate calcium disodium, and sodium metabisulfite]; bupivacaine hydrochloride 0.5% and epinephrine bitartrate 1:200,000 (50 mL) [contains methylparaben, edetate calcium disodium, and sodium metabisulfite]
>
> Sensorcaine® with Epinephrine: Bupivacaine hydrochloride 0.25% and epinephrine bitartrate 1:200,000 (50 mL) [contains methylparaben and sodium metabisulfite]; bupivacaine hydrochloride 0.5% and epinephrine bitartrate 1:200,000 (50 mL) [contains methylparaben and sodium metabisulfite]

Generic Available

Yes

Mechanism of Action

Local anesthetics bind selectively to the intracellular surface of sodium channels to block influx of sodium into the axon. As a result, depolarization necessary for action potential propagation and subsequent nerve function is prevented. The block at the sodium channel is reversible. When drug diffuses away from the axon, sodium channel function is restored and nerve propagation returns.

Epinephrine prolongs the duration of the anesthetic actions of bupivacaine by causing vasoconstriction (alpha-adrenergic receptor agonist) of the vasculature surrounding the nerve axons. This prevents the diffusion of bupivacaine away from the nerves resulting in a longer retention in the axon

Pharmacodynamics/Kinetics

Refer to Bupivacaine; epinephrine reduces the rate of absorption and peak plasma concentration of bupivacaine

Related Information

- Bupivacaine
- EPINEPHrine

Dental Health: Effects on Dental Treatment

It is common to misinterpret psychogenic responses to local anesthetic injection as an allergic reaction. Intraoral injections are perceived by many patients as a stressful procedure in dentistry. Common symptoms to this stress are diaphoresis, palpitations, and hyperventilation. Patients may exhibit hypersensitivity to bisulfites contained in local anesthetic solution to prevent oxidation of epinephrine. In general, patients reacting to bisulfites have a history of asthma and their airways are hyper-reactive to asthmatic syndrome.

Degree of adverse effects in the CNS and cardiovascular system is directly related to the blood levels of bupivacaine: Bradycardia, hypersensitivity reactions (rare; may be manifest as dermatologic reactions and edema at injection site), asthmatic syndromes.

High blood levels: Anxiety, restlessness, disorientation, confusion, dizziness, tremors, seizures, CNS depression (resulting in somnolence, unconsciousness and possible respiratory arrest), nausea, and vomiting.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, restlessness, confusion, dizziness, and sedation

Mental Health: Effects on Psychiatric TreatmentUse with caution in patients receiving phenothiazines, MAO inhibitors, or TCAs; severe hypertension or hypotension may result

Index TermsEpinephrine Bitartrate and Bupivacaine Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Bupivacaine may be confused with mepivacaine, ropivacaine

Marcaine® may be confused with Narcan®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (epidural administration) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(byoo PIV a kane)

U.S. Brand NamesMarcaine®; Marcaine® Spinal; Sensorcaine®; Sensorcaine®-MPF; Sensorcaine®-MPF Spinal

Canadian Brand NamesMarcaine®; Sensorcaine®

Pharmacologic CategoryLocal Anesthetic

Use: Labeled IndicationsLocal anesthetic (injectable) for peripheral nerve block, infiltration, sympathetic block, caudal or epidural block, retrobulbar block

Use: DentalNone; not to be confused with bupivacaine and epinephrine dental anesthetic. Refer to Bupivacaine and Epinephrine.

Dosing: Adults**Note:** Dose varies with procedure, depth of anesthesia, vascularity of tissues, duration of anesthesia, and condition of patient. Do not use solutions containing preservatives for caudal or epidural block.

Local anesthesia: Infiltration: 0.25% infiltrated locally; maximum: 175 mg

Caudal block) (preservative free: 15-30 mL of 0.25% or 0.5%

Epidural block (other than caudal block; preservative free): Administer in 3-5 mL increments, allowing sufficient time to detect toxic manifestations of inadvertent I.V. or I.T. administration: 10-20 mL of 0.25% or 0.5%

Surgical procedures requiring a high degree of muscle relaxation and prolonged effects **only**: 10-20 mL of 0.75% (**Note:** Not to be used in obstetrical cases)

Peripheral nerve block: 5 mL of 0.25 or 0.5%; maximum: 400 mg/day

Sympathetic nerve block: 20-50 mL of 0.25%

Retrobulbar anesthesia: 2-4 mL of 0.75%

Spinal anesthesia: Preservative free solution of 0.75% bupivacaine in 8.25% dextrose:

Lower extremity and perineal procedures: 1 mL

Lower abdominal procedures: 1.6 mL

Normal vaginal delivery: 0.8 mL (higher doses may be required in some patients)

Cesarean section: 1-1.4 mL

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Dose varies with procedure, depth of anesthesia, vascularity of tissues, duration of anesthesia, and condition of patient. Do not use solutions containing preservatives for caudal or epidural block.

Caudal block, epidural block, local anesthesia: Children >12 years: Refer to adult dosing.

Peripheral or sympathetic nerve block: Children >12 years: Refer to adult dosing.

Retrobulbar anesthesia: Children >12 years: Refer to adult dosing.

Administration: I.V. DetailpH: 4.0-6.5

Administration: OtherSolutions containing preservatives should not be used for epidural or caudal blocks.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86˚F).

CompatibilityStable in NS.

Compatibility in syringe: Compatible: Clonidine with morphine, diamorphine, fentanyl with ketamine, hydromorphone, iohexol, morphine. **Variable (consult detailed reference):** Sodium bicarbonate.

Compatibility when admixed: Compatible: Buprenorphine, diamorphine, epinephrine, fentanyl, hydromorphone, morphine, sufentanil.

ContraindicationsHypersensitivity to bupivacaine hydrochloride, amide-type local anesthetics, or any component of the formulation; obstetrical paracervical block anesthesia

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Boxed warnings:

- Obstetrical anesthesia: See “Dosage form specific issues” below.

Concerns related to adverse effects:

- Respiratory arrest: Local anesthetics have been associated with rare occurrences of sudden respiratory arrest, especially when administered near the head or neck.
- Seizures: Convulsions due to systemic toxicity leading to cardiac arrest have also been reported, presumably following unintentional intravascular injection or administration near the head or neck.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Hepatic impairment: Use with caution in patients with hepatic impairment.

Special populations:

- Acutely ill patients: Use with caution in acutely ill patients; dose reduction may be required.
- Debilitated patients: Use with caution in debilitated patients; dose reduction may be required.
- Elderly: Use with caution in the elderly; dose reduction may be required.
- Pediatrics: Not recommended for use in children <12 years of age. The solution for spinal anesthesia should not be used in children <18 years of age.

Dosage form specific issues:

- Obstetrical anesthesia: **[U.S. Boxed Warning]: The 0.75% is not recommended for obstetrical anesthesia.**
- Preservative-containing solutions: **Do not use solutions containing preservatives for caudal or epidural block**.

Other warnings/precautions:

- Administration: Intravascular injections should be avoided; aspiration should be performed prior to administration; the needle must be repositioned until no return of blood can be elicited by aspiration; however, absence of blood in the syringe does not guarantee that intravascular injection has been avoided.
- Test dose: A test dose is recommended prior to epidural administration (prior to initial dose) and all reinforcing doses with continuous catheter technique.
- Trained personnel: Clinicians using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDecreased pup survival and embryocidal effects were observed in animal studies. Bupivacaine is approved for use at term in obstetrical anesthesia or analgesia. **[U.S. Boxed Warning]: The 0.75% is not recommended for obstetrical anesthesia.** Bupivacaine 0.75% solutions have been associated with cardiac arrest following epidural anesthesia in obstetrical patients and use of this concentration is not recommended for this purpose. Use in obstetrical paracervical block anesthesia is contraindicated.

LactationEnters breast milk/not recommended

Adverse Reactions**Note:** Incidence of adverse reactions is difficult to define. Most effects are dose related, and are often due to accelerated absorption from the injection site, unintentional intravascular injection, or slow metabolic degradation. The development of any central nervous system symptoms may be an early indication of more significant toxicity (seizure).

Cardiovascular: Hypotension, bradycardia, palpitation, heart block, ventricular arrhythmia, cardiac arrest

Central nervous system: Restlessness, anxiety, dizziness, seizure (0.1%); rare symptoms (usually associated with unintentional subarachnoid injection during high spinal anesthesia) include persistent anesthesia, paresthesia, paralysis, headache, septic meningitis, and cranial nerve palsies

Gastrointestinal: Nausea, vomiting; rare symptoms (usually associated with unintentional subarachnoid injection during high spinal anesthesia) include fecal incontinence and loss of sphincter control

Genitourinary: Rare symptoms (usually associated with unintentional subarachnoid injection during high spinal anesthesia) include urinary incontinence, loss of perineal sensation, and loss of sexual function

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision, pupillary constriction

Otic: Tinnitus

Respiratory: Apnea, hypoventilation (usually associated with unintentional subarachnoid injection during high spinal anesthesia)

Miscellaneous: Allergic reactions (urticaria, pruritus, angioedema), anaphylactoid reactions

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 2C19, 2D6, 3A4

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersVital signs, state of consciousness; signs of CNS toxicity; fetal heart rate during paracervical anesthesia

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for additive or adverse interactions. Monitor for effectiveness of anesthesia and adverse reactions. Monitor for return of sensation. Teach patient adverse reactions to report; use and teach appropriate interventions to promote safety.

Patient EducationThis medication is given to reduce sensation in the injected area. You will experience decreased sensation to pain, heat, or cold in the area and/or decreased muscle strength (depending on area of application) until the effects wear off; use necessary caution to reduce incidence of possible injury until full sensation returns. If used in mouth, do not eat or drink until full sensation returns. Immediately report chest pain or palpitations; increased restlessness, anxiety, or dizziness; skeletal or muscle weakness; respiratory difficulty; ringing in ears; or vision changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride [preservative free]: 0.25% (10 mL, 20 mL, 30 mL, 50 mL); 0.5% (10 mL, 20 mL, 30 mL); 0.75% (10 mL, 20 mL, 30 mL)

> Marcaine®: 0.25% (10 mL, 30 mL); 0.5% (10 mL, 30 mL); 0.75% (10 mL, 30 mL)
>
> Sensorcaine®-MPF: 0.25% (10 mL, 30 mL); 0.5% (10 mL, 30 mL); 0.75% (10 mL, 30 mL)

Injection, solution, as hydrochloride [preservative free]: 0.75% (2 mL) [in dextrose 8.25%]

> Marcaine® Spinal: 0.75% (2 mL) [in dextrose 8.25%]
>
> Sensorcaine®-MPF Spinal: 0.75% (2 mL) [in dextrose 8.25%]

Injection, solution, as hydrochloride:

> Marcaine®, Sensorcaine®: 0.25% (50 mL); 0.5% (50 mL) [contains methylparaben]

Generic AvailableYes

Mechanism of ActionBlocks both the initiation and conduction of nerve impulses by decreasing the neuronal membrane's permeability to sodium ions, which results in inhibition of depolarization with resultant blockade of conduction

Pharmacodynamics/Kinetics

Onset of action: Anesthesia (route and dose dependent): 1-17 minutes

Duration (route and dose dependent): 2-9 hours

Protein binding: ~95%

Metabolism: Hepatic; forms metabolite (PPX)

Half-life elimination (age dependent): Neonates: 8.1 hours; Adults: 1.5-5.5 hours

Excretion: Urine (~6% unchanged)

Related Information

- Bupivacaine and Epinephrine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety and restlessness

Mental Health: Effects on Psychiatric TreatmentUse with caution in patients receiving phenothiazines, MAO inhibitors, or TCAs; severe hypertension or hypotension may result

Anesthesia and Critical Care Concerns/Other Considerations

Local anesthetic toxicity: Cardiac arrest: Lipid infusion has been used in animal studies and several human cases (Bupivacaine: Rosenblatt, 2006; Levobupivacaine: Foxall, 2007; Ropivacaine: Litz, 2006) where cardiovascular toxicity, unresponsive to conventional resuscitation, resulted. Additional information is available at http://www.lipidrescue.org. The protocol from the website is: **20% Fat Emulsion:** 1.5 mL/kg administered over 1 minute, followed immediately by an infusion of 0.25 mL/kg/minute. Continue chest compressions (lipid must circulate). Repeat bolus every 3-5 minutes up to 3 mL/kg total dose until circulation restored. Continue infusion until hemodynamic stability is restored. Increase the infusion rate to 0.5 mL/kg/minute if BP declines. A maximum total dose of 8 mL/kg is recommended.

Index TermsBupivacaine Hydrochloride

Buprenorphine and Naloxone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(byoo pre NOR feen & nal OKS one)
U.S. Brand NamesSuboxone®
Pharmacologic CategoryAnalgesic, Opioid
Use: Labeled IndicationsTreatment of opioid dependence
Dosing: AdultsOpioid dependence: Sublingual: **Note:** This combination product is not recommended for use during the induction period; initial treatment should begin using buprenorphine oral tablets. Patients should be switched to the combination product for maintenance and unsupervised therapy.

Maintenance: Target dose (based on buprenorphine content): 16 mg/day; range: 4-24 mg/day

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricOpioid dependence: Children ≥16 years: Refer to adult dosing.
Administration: OralSublingual: Tablet should be placed under the tongue until dissolved; should not be swallowed. If two or more tablets are needed per dose, all may be placed under the tongue at once, or two at a time. To ensure consistent bioavailability, subsequent doses should always be taken the same way.
Dietary Considerations

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

StorageStore at room temperature of 25°C (77°F).
RestrictionsC-III; Prescribing of tablets for opioid dependence is limited to physicians who have met the qualification criteria and have received a DEA number specific to prescribing this product. Tablets will be available through pharmacies and wholesalers which normally provide controlled substances.
ContraindicationsHypersensitivity to buprenorphine, naloxone, or any component of the formulation
Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- Bowel obstruction: Use with caution in patients with a history of ileus or bowel obstruction.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Ethanol abuse: Use with caution in patients with alcoholism or delirium tremens.
- Glaucoma: Use with caution in patients with glaucoma.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Obesity: Use with caution in patients who are morbidly obese.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Psychosis: Use with caution in patients with toxic psychosis.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Safety and efficacy have not been established in children <16 years of age.

Other warnings/precautions:

- Appropriate use: Combination product is indicated for maintenance therapy and should not be used for induction. Oral buprenorphine is not approved for management of pain.

- Withdrawal: Partial antagonist activity of buprenorphine may precipitate acute narcotic withdrawal in opioid-dependent individuals upon rapid discontinuation. Naloxone may precipitate intense withdrawal symptoms in patients addicted to opiates when administered before the opioid effects have subsided, or misused parenterally in opioid-dependent individuals.

Pregnancy Risk FactorC

Pregnancy ConsiderationsWithdrawal has been reported in infants of women receiving buprenorphine during pregnancy. Onset of symptoms ranged from day 1 to day 8 of life, most occurring on day 1.

LactationBuprenorphine: Enters breast milk/not recommended

Adverse ReactionsAlso see individual agents.

>10%:

Central nervous system: Headache (36%), pain (22%)

Gastrointestinal: Nausea (15%), constipation (12%), abdominal pain (11%)

Miscellaneous: Withdrawal syndrome (25%; placebo 37%), diaphoresis (14%)

1% to 10%:

Cardiovascular: Vasodilation (9%)

Gastrointestinal: Vomiting (7%)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Atazanavir: May increase the serum concentration of Buprenorphine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Monitoring ParametersRespiratory and mental status, CNS depression; symptoms of withdrawal
Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, sublingual: Buprenorphine 2 mg and naloxone 0.5 mg; buprenorphine 8 mg and naloxone 2 mg [lemon-lime flavor]

Generic AvailableNo
ManufacturerReckitt Benckiser
Pricing: U.S. (www.drugstore.com)

Sublingual (Suboxone)

8-2 mg (30): $172.33

Mechanism of ActionSee individual agents.
Pharmacodynamics/KineticsSee individual agents.

Absorption: Absorption of the combination product is variable among patients following sublingual use, but variability within each individual patient is low.

Sound-alike/look-alike issues:

Buprenex® may be confused with Brevibloc®, Bumex®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(byoo pre NOR feen)
U.S. Brand NamesBuprenex®; Subutex®
Canadian Brand NamesBuprenex®; Subutex®
Pharmacologic CategoryAnalgesic, Opioid
Use: Labeled Indications

Injection: Management of moderate to severe pain

Tablet: Treatment of opioid dependence

Use: Unlabeled/InvestigationalInjection: Heroin and opioid withdrawal
Dosing: Adults**Long-term use is not recommended**

Note: These are guidelines and do not represent the maximum doses that may be required in all patients. Doses should be titrated to pain relief/prevention. In high-risk patients (eg, elderly, debilitated, presence of respiratory disease) and/or concurrent CNS depressant use, reduce dose by one-half. Buprenorphine has an analgesic ceiling.

Acute pain (moderate to severe):

I.M.: Initial: Opiate-naive: 0.3 mg every 6-8 hours as needed; initial dose (up to 0.3 mg) may be repeated once in 30-60 minutes after the initial dose if needed; usual dosage range: 0.15-0.6 mg every 4-8 hours as needed

Slow I.V.: Initial: Opiate-naive: 0.3 mg every 6-8 hours as needed; initial dose (up to 0.3 mg) may be repeated once in 30-60 minutes after the initial dose if needed

Heroin or opiate withdrawal (unlabeled use): I.M., slow I.V.: Variable; 0.1-0.4 mg every 6 hours

Opioid dependence: Sublingual:

Induction: Range: 12-16 mg/day (doses during an induction study used 8 mg on day 1, followed by 16 mg on day 2; induction continued over 3-4 days). Treatment should begin at least 4 hours after last use of heroin or short-acting opioid, preferably when first signs of withdrawal appear. Titrating dose to clinical effectiveness should be done as rapidly as possible to prevent undue withdrawal symptoms and patient drop-out during the induction period.

Maintenance: Target dose: 16 mg/day; range: 4-24 mg/day; patients should be switched to the buprenorphine/naloxone combination product for maintenance and unsupervised therapy

Dosing: ElderlyModerate to severe pain: I.M., slow I.V.: 0.15 mg every 6 hours; elderly patients are more likely to suffer from confusion and drowsiness compared to younger patients. **Long-term use is not recommended.**
Dosing: Pediatric

Acute pain (moderate to severe):

Children 2-12 years: I.M., slow I.V.: 2-6 mcg/kg every 4-6 hours

Children ≥13 years: Refer to adult dosing.

Opioid dependence: Children ≥16 years: Refer to adult dosing.

Calculations

- Opioid Agonist Conversion

Administration: I.V.Administer slowly, over at least 2 minutes.
Administration: I.V. DetailpH: 3.5-5.5
Administration: OralSublingual: Tablet should be placed under the tongue until dissolved; should not be swallowed. If two or more tablets are needed per dose, all may be placed under the tongue at once, or two at a time. To ensure consistent bioavailability, subsequent doses should always be taken the same way.

Storage

Injection: Protect from excessive heat >40°C (>104°F) and light.

Tablet: Store at room temperature of 25°C (77°F).

CompatibilityInjection:

Y-site administration: Compatible: Allopurinol, amifostine, aztreonam, cefepime, cisatracurium, cladribine, docetaxel, etoposide, filgrastim, gatifloxacin, gemcitabine, granisetron, linezolid, melphalan, piperacillin/tazobactam, propofol, remifentanil, teniposide, thiotepa, vinorelbine. **Incompatible:** Amphotericin B cholesteryl sulfate complex, doxorubicin liposome.

Compatibility in syringe: Compatible: Midazolam.

Compatibility when admixed: Compatible: Atropine, bupivacaine, diphenhydramine, droperidol, glycopyrrolate, haloperidol, hydroxyzine, promethazine, scopolamine. **Incompatible:** Diazepam, floxacillin, furosemide, lorazepam.

RestrictionsInjection: C-V/C-III; Tablet: C-III

Prescribing of tablets for opioid dependence is limited to physicians who have met the qualification criteria and have received a DEA number specific to prescribing this product. Tablets will be available through pharmacies and wholesalers which normally provide controlled substances.

ContraindicationsHypersensitivity to buprenorphine or any component of the formulation

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.

- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.

- Bowel obstruction: Use with caution in patients with a history of ileus or bowel obstruction.

- CNS depression/coma: Use with caution in patients with CNS depression or coma.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Obesity: Use with caution in patients who are morbidly obese.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Psychosis: Use with caution in patients with toxic psychosis.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Safety and efficacy of the tablet formulation have not been established in children <16 years of age; safety and efficacy of the injection formulation have not been established in children <2 years of age.

Other warnings/precautions:

- Optimal regimen: An opioid-containing analgesic regimen should be tailored to each patient's needs and based upon the type of pain being treated (acute versus chronic), the route of administration, degree of tolerance for opioids (naive versus chronic user), age, weight, and medical condition. The optimal analgesic dose varies widely among patients; doses should be titrated to pain relief/prevention.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms. Tablets, which are used for induction treatment of opioid dependence, should not be started until effects of withdrawal are evident.

Geriatric ConsiderationsOne postmarketing study found that elderly patients were more likely to suffer from confusion and drowsiness after buprenorphine as compared to younger patients.

Pregnancy Risk FactorC

Pregnancy ConsiderationsWithdrawal has been reported in infants of women receiving buprenorphine during pregnancy. Onset of symptoms ranged from day 1 to day 8 of life, most occurring on day 1.

LactationEnters breast milk/not recommended

Adverse Reactions

Injection:

>10%: Central nervous system: Sedation

1% to 10%:

Cardiovascular: Hypotension

Central nervous system: Respiratory depression, dizziness, headache

Gastrointestinal: Vomiting, nausea

Ocular: Miosis

Otic: Vertigo

Miscellaneous: Diaphoresis

<1%: Agitation, allergic reaction, apnea, appetite decreased, blurred vision, bradycardia, confusion, constipation, convulsion, coma, cyanosis, depersonalization, depression, diplopia, dyspnea, dysphoria, euphoria, fatigue, flatulence, flushing, hallucinations, hypertension, injection site reaction, malaise, nervousness, pallor, paresthesia, pruritus, psychosis, rash, slurred speech, tachycardia, tinnitus, tremor, urinary retention, urticaria, weakness, Wenckebach block, xerostomia

Tablet:

>10%:

Central nervous system: Headache (30%), pain (24%), insomnia (21% to 25%), anxiety (12%), depression (11%)

Gastrointestinal: Nausea (10% to 14%), abdominal pain (12%), constipation (8% to 11%)

Neuromuscular & skeletal: Back pain (14%), weakness (14%)

Respiratory: Rhinitis (11%)

Miscellaneous: Withdrawal syndrome (19%; placebo 37%), infection (12% to 20%), diaphoresis (12% to 13%)

1% to 10%:

Central nervous system: Chills (6%), nervousness (6%), somnolence (5%), dizziness (4%), fever (3%)

Gastrointestinal: Vomiting (5% to 8%), diarrhea (5%), dyspepsia (3%)

Ocular: Lacrimation (5%)

Respiratory: Cough (4%), pharyngitis (4%)

Miscellaneous: Flu-like syndrome (6%)

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (weak), 2A6 (weak), 2C19 (weak), 2D6 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Atazanavir: May increase the serum concentration of Buprenorphine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersPain relief, respiratory and mental status, CNS depression, blood pressure; LFTs

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for possible additive or adverse interactions. Monitor for effectiveness of pain relief and adverse reactions or overdose (can cause respiratory depression) at beginning of therapy and at regular intervals with long-term use. For inpatients, implement safety measures. Assess knowledge/teach patient appropriate use (if self-administered). Teach patient to monitor and report adverse reactions and appropriate interventions to reduce side effects.

Monitoring: Lab TestsLFTs

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. May cause dizziness, drowsiness, confusion, or blurred vision (use caution when driving, climbing stairs, rising from sitting or lying position, or engaging in tasks requiring alertness until response to drug is known). You may experience nausea or vomiting (frequent mouth care, small frequent meals, sucking lozenges, or chewing gum may help); or constipation (increased exercise, fluids, or dietary fruit and fiber may help). If constipation is unresolved, consult prescriber about use of stool softeners and/or laxatives. Report unresolved nausea or vomiting; respiratory difficulty or shortness of breath; excessive sedation or unusual weakness; or rapid heartbeat or palpitations. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 0.3 mg/mL (1 mL) [C-III]

Buprenex®: 0.3 mg/mL (1 mL) [C-V]

Tablet, sublingual:

Subutex®: 2 mg, 8 mg

Generic AvailableYes: Injection

Pricing: U.S. (www.drugstore.com)

Solution (Buprenex)

0.3 mg/mL (5): $26.25

Mechanism of ActionBuprenorphine exerts its analgesic effect via high affinity binding to μ opiate receptors in the CNS; displays both agonist and antagonist activity

Pharmacodynamics/Kinetics

Onset of action: Analgesic: 10-30 minutes

Duration: 6-8 hours

Absorption: I.M., SubQ: 30% to 40%

Distribution: V_d: 97-187 L/kg

Protein binding: High

Metabolism: Primarily hepatic; extensive first-pass effect

Half-life elimination: 2.2-3 hours

Excretion: Feces (70%); urine (20% as unchanged drug)

Related Information

- Addiction Treatments
- Narcotic / Opioid Analgesics

Pharmacotherapy PearlsSubutex® (buprenorphine) should be limited to supervised use whenever possible; patients should be switched to Suboxone® (buprenorphine/naloxone) for maintenance and unsupervised therapy

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; rare reports of euphoria

Mental Health: Effects on Psychiatric TreatmentConcurrent use with benzodiazepines or barbiturates may result in CNS or respiratory depression

Anesthesia and Critical Care Concerns/Other ConsiderationsBuprenorphine has a longer duration of action than either morphine or meperidine. It may precipitate withdrawal in narcotic-dependent patients. Buprenorphine is not readily reversed by naloxone. Avoid in labor.

Index TermsBuprenorphine Hydrochloride

Special Alerts

Medications for ADHD: AHA Clarification of Cardiovascular Screening Recommendation - May 2008

In an effort to reduce the rate of sudden cardiac death especially in pediatric patients receiving stimulant medications for the treatment of attention-deficit/hyperactivity disorder (ADHD), the American Heart Association (AHA) has issued a statement in April 2008 recommending that all children diagnosed with ADHD who may be candidates for stimulant medications have a thorough cardiovascular assessment prior to initiation of drug therapy. The AHA scientific statement was issued by the Council on Cardiovascular Disease in the Young Congenital Cardiac Defects Committee and the Council on Cardiovascular Nursing. On May 16, 2008, the AHA issued a clarification of the recommendations due to the language regarding ECG recommendations and subsequent interpretations.

These recommendations are based on the Food and Drug Administration (FDA) reports of serious cardiovascular adverse events (including sudden death) in patients (both children and adults) taking usual doses of stimulant medications. Most of these patients were found to have underlying structural heart disease (eg, hypertrophic obstructive cardiomyopathy). In 2006, these reports prompted the FDA to recommend labeling changes of these medications to include warnings about cardiovascular events and to develop patient medication guides to be distributed with each prescription.

Stimulant medications theoretically increase cardiovascular risk due to potential effects on blood pressure elevation and increased heart rate. These effects have generally been considered clinically insignificant in most children, however, may be detrimental in certain patients with underlying cardiovascular disease. None of the medications have been shown to cause heart conditions or proven to have caused sudden cardiac death.

The committee suggests that patients needing the following ADHD medications receive a thorough cardiovascular assessment: Methylphenidate, amphetamine, dextroamphetamine, atomoxetine, clonidine, guanfacine, desipramine, imipramine, bupropion, and modafinil.

According to the clarified AHA recommendations, this assessment should include a combination of thorough medical history, family history, and physical examination with the intent to identify risk factors for sudden death. Although not mandatory, physicians should consider obtaining an ECG.

Patients already maintained on ADHD medications should not stop taking their medication. Instead, patients or their caregivers should contact their healthcare provider. It is reasonable that these patients undergo a similar cardiovascular assessment without interruption of therapy.

Press releases and clarified recommendations from the AHA note that the intent of this statement is not to reduce appropriate use of these medications, but to provide physicians with useful tools to identify heart conditions in children with ADHD in order to make more informed prescribing decisions. ECG testing is recommended as one option to be used as part of a combination screening process. They do suggest that a lack of ECG testing should not necessarily mean that treatment not be initiated.

The clarified statement has been endorsed by the American Academy of Child and Adolescent Psychiatry, the American College of Cardiology, Children and Adults with Attention-Deficit/Hyperactivity Disorder, and the National Initiative for Children’s Healthcare Quality.

Medication Safety Issues

Sound-alike/look-alike issues:

BuPROPion may be confused with busPIRone

Wellbutrin SR® may be confused with Wellbutrin XL™

Wellbutrin XL™ may be confused with Wellbutrin SR®

Zyban® may be confused with Zagam®, Diovan®

Pronunciation(byoo PROE pee on)
U.S. Brand NamesBudeprion XL®; Budeprion™ SR; Buproban™; Wellbutrin SR®; Wellbutrin XL™; Wellbutrin®; Zyban®
Canadian Brand NamesNovo-Bupropion SR; Wellbutrin XL™; Wellbutrin®; Zyban®
Pharmacologic CategoryAntidepressant, Dopamine-Reuptake Inhibitor; Smoking Cessation Aid
Use: Labeled IndicationsTreatment of major depressive disorder, including seasonal affective disorder (SAD); adjunct in smoking cessation
Use: Unlabeled/InvestigationalAttention-deficit/hyperactivity disorder (ADHD); depression associated with bipolar disorder
Dosing: Adults

Depression: Oral:

Immediate release: 100 mg 3 times/day; begin at 100 mg twice daily; may increase to a maximum dose of 450 mg/day.

Sustained release: Initial: 150 mg/day in the morning; may increase to 150 mg twice daily by day 4 if tolerated; target dose: 300 mg/day given as 150 mg twice daily; maximum dose: 400 mg/day given as 200 mg twice daily.

Extended release: Initial: 150 mg/day in the morning; may increase as early as day 4 of dosing to 300 mg/day; maximum dose: 450 mg/day

SAD (Wellbutrin XL™): Oral: Initial: 150 mg/day in the morning; if tolerated, may increase after 1 week to 300 mg/day

Note: Prophylactic treatment should be reserved for those patients with frequent depressive episodes and/or significant impairment. Initiate treatment in the Autumn prior to symptom onset, and discontinue in early Spring with dose tapering to 150 mg/day for 2 weeks

Smoking cessation (Zyban®): Oral: Initiate with 150 mg once daily for 3 days; increase to 150 mg twice daily; treatment should continue for 7-12 weeks.

Dosing conversion between immediate, sustained, and extended release products: Convert using same total daily dose (up to the maximum recommended dose for a given dosage form), but adjust frequency as indicated for sustained (twice daily) or extended (once daily) release products.

Dosing: Elderly

Depression: Oral: Initial: 37.5 mg of immediate release tablets twice daily or 100 mg/day of sustained release tablets; increase by 37.5-100 mg every 3-4 days as tolerated. There is evidence that the elderly respond at 150 mg/day in divided doses, but some may require a higher dose. **Note:** Patients with Alzheimer’s dementia-related depression may require a lower starting dosage of 37.5 mg once or twice daily (100 mg/day sustained release), increased as needed up to 300 mg/day in divided doses (300 mg/day for sustained release)

Smoking cessation: Refer to adult dosing.

Dosing: PediatricADHD (unlabeled use): Oral: Children and Adolescents: 1.4-6 mg/kg/day
Dosing: Renal ImpairmentPer the manufacturer, the elimination of hydroxybupropion and threohydrobupropion are reduced in patients with end stage renal failure. Other research has noted a reduction in bupropion clearance (Turpeinen, 2007). Consider a reduction in frequency and/or dosage in this patient population.
Dosing: Hepatic Impairment

Mild-to-moderate hepatic impairment: Use with caution and/or reduced dose/frequency

Severe hepatic cirrhosis: Use with extreme caution; maximum dose:

Wellbutrin®: 75 mg/day;

Wellbutrin SR®: 100 mg/day or 150 mg every other day

Wellbutrin XL™: 150 mg every other day

Zyban®: 150 mg every other day

Note: The mean AUC increased by ~1.5-fold for hydroxybupropion and ~2.5-fold for erythro/threohydrobupropion; median T_{max} was observed 19 hours later for hydroxybupropion, 31 hours later for erythro/threohydrobupropion; mean half-life for hydroxybupropion increased fivefold, and increased twofold for erythro/threohydrobupropion in patients with severe hepatic cirrhosis compared to healthy volunteers.

Administration: Oral May be taken without regard to meals. Zyban® and extended release tablets should be swallowed whole; do not crush, chew, or divide. The insoluble shell of the extended-release tablet may remain intact during GI transit and is eliminated in the feces. Data from the manufacturer states that dividing Wellbutrin® SR tablets resulted in an increased rate of release at 15 minutes: “However, the divided tablet retained its sustained-release characteristics with similar increases of released bupropion at each sampling point beyond 15 minutes when compared to the intact Wellbutrin® SR tablet...” Bupropion is hydroscopic and therefore should be stored in a dry place. Splitting of large quantities in advance of administration is not advised since loss of potency may result. If necessary, splitting should be done cleanly without crushing.

Storage

Store at controlled room temperature of 20°C to 25°C (68°F to 77°F).

Wellbutrin XL™: Store at 15°C to 30°C (59°F to 86°F).

Restrictions An FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

Contraindications Hypersensitivity to bupropion or any component of the formulation; seizure disorder; anorexia/bulimia; use of MAO inhibitors within 14 days; patients undergoing abrupt discontinuation of ethanol or sedatives (including benzodiazepines); patients receiving other dosage forms of bupropion

Allergy Considerations

- BuPROPion Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Bupropion is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Bupropion is not FDA approved for bipolar depression.**

Concerns related to adverse effects:

- CNS stimulation: May cause CNS stimulation (restlessness, anxiety, insomnia) or anorexia.

- Cognitive impairment: May cause motor or cognitive impairment in some patients, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Delayed hypersensitivity reactions: Arthralgia, myalgia, and fever with rash and other symptoms suggestive of delayed hypersensitivity resembling serum sickness have been reported.

- Seizures: The risk of seizures is dose-dependent and increased in patients with a history of seizures, anorexia/bulimia, head trauma, CNS tumor, severe hepatic cirrhosis, abrupt discontinuation of sedative-hypnotics or ethanol, medications which lower seizure threshold (antipsychotics, antidepressants, theophyllines, systemic steroids), stimulants, or hypoglycemic agents. Discontinue and do not restart in patients experiencing a seizure.

- Sexual dysfunction: The incidence of sexual dysfunction with bupropion is generally lower than with SSRIs.

- Weight loss: May cause weight loss; use caution in patients where weight loss is not desirable.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease, history of hypertension, or coronary artery disease; treatment-emergent hypertension (including some severe cases) has been reported, both with bupropion alone and in combination with nicotine transdermal systems.

- Hepatic impairment: Use with caution in patients with hepatic impairment; reduced dose recommended.
- Renal impairment: Use with caution in patients with renal impairment; reduced dose recommended.

Special populations:

- Elderly: Use with caution in the elderly; may be at greater risk of accumulation during chronic dosing. Reduced dose recommended.

Dosage form specific issues:

- Extended release tablet: Insoluble tablet shell may remain intact and be visible in the stool.

Other warnings/precautions:

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

Geriatric ConsiderationsLimited data available about the use of bupropion in the elderly; two studies have found it equally effective when compared to imipramine. Its side effect profile (minimal anticholinergic and blood pressure effects) may make it useful in persons who do not tolerate traditional cyclic antidepressants. A single and multiple dose pharmacokinetic study suggested that accumulation of bupropion and its metabolites may occur in the elderly.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDue to adverse events observed in some animal studies, bupropion is classified as pregnancy category C. A significant increase in major teratogenic effects has not been observed following exposure to bupropion during pregnancy; however, the risk of spontaneous abortions may be increased (additional studies are needed to confirm). The long-term effects on development and behavior have not been studied.

Pregnancy itself does not provide protection against depression. The ACOG recommends that therapy with antidepressants during pregnancy be individualized and should incorporate the clinical expertise of the mental health clinician, obstetrician, primary care provider, and pediatrician. If treatment is needed, consider gradually stopping antidepressants 10-14 days before the expected date of delivery to prevent potential withdrawal symptoms in the infant. If this is done and the woman is considered to be at risk of relapse from her major depressive disorder, the medication can be restarted following delivery, although the dose should be readjusted to that required before pregnancy. Bupropion has also been evaluated for smoking cessation during pregnancy; current recommendations suggest that pharmacologic treatments be considered only after other therapies have failed. A registry has been established for women exposed to bupropion during pregnancy (800-336-2176).

LactationEnters breast milk/not recommended (AAP rates “of concern”)

Breast-Feeding ConsiderationsBupropion and its metabolites are excreted into breast milk, although neither bupropion nor its metabolites have been detected in the plasma of breast-fed infants. Adverse events have not been reported in older breast-fed infants; however, a seizure was noted in one 6-month old infant (a causal effect could not be confirmed). Breast-feeding is not recommended by the manufacturer. The AAP considers bupropion to be a “drug for which the effect on the nursing infant is unknown, but may be of concern.”

Pregnancy & Lactation, In-Depth

- BuPROPion in Pregnancy & Lactation

Adverse ReactionsFrequencies, when reported, reflect highest incidence reported with sustained release product.

>10%:

Cardiovascular: Tachycardia (11%)

Central nervous system: Headache (25% to 34%), insomnia (11% to 20%), dizziness (6% to 11%)

Gastrointestinal: Xerostomia (17% to 26%), weight loss (14% to 23%), nausea (1% to 18%)

Respiratory: Pharyngitis (3% to 13%)

1% to 10%:

Cardiovascular: Palpitation (2% to 6%), arrhythmias (5%), chest pain (3% to 4%), hypertension (2% to 4%, may be severe), flushing (1% to 4%), hypotension (3%)

Central nervous system: Agitation (2% to 9%), confusion (8%), anxiety (5% to 7%), hostility (6%), nervousness (3% to 5%), sleep disturbance (4%), sensory disturbance (4%), migraine (1% to 4%), abnormal dreams (3%), irritability (2% to 3%), somnolence (2% to 3%), pain (2% to 3%), memory decreased (up to 3%), fever (1% to 2%), CNS stimulation (1% to 2%), depression

Dermatologic: Rash (1% to 5%), pruritus (2% to 4%), urticaria (1% to 2%)

Endocrine & metabolic: Menstrual complaints (2% to 5%), hot flashes (1% to 3%), libido decreased (3%)

Gastrointestinal: Constipation (5% to 10%), abdominal pain (2% to 9%), diarrhea (5% to 7%), flatulence (6%), anorexia (3% to 5%), appetite increased (4%), taste perversion (2% to 4%), vomiting (2% to 4%), dyspepsia (3%), dysphagia (up to 2%)

Genitourinary: Urinary frequency (2% to 5%), urinary urgency (up to 2%), vaginal hemorrhage (up to 2%), UTI (up to 1%)

Neuromuscular & skeletal: Tremor (3% to 6%), myalgia (2% to 6%), weakness (2% to 4%), arthralgia (1% to 4%), arthritis (2%), akathisia (2%), paresthesia (1% to 2%), twitching (1% to 2%), neck pain

Ocular: Amblyopia (2%), blurred vision (2% to 3%)

Otic: Tinnitus (3% to 6%), auditory disturbance (5%)

Respiratory: Upper respiratory infection (9%), cough increased (1% to 4%), sinusitis (1% to 5%)

Miscellaneous: Infection (8% to 9%), diaphoresis increased (5% to 6%), allergic reaction (including anaphylaxis, pruritus, urticaria)

Postmarketing and/or case reports: Accommodation abnormality, aggression, akinesia, alopecia, amnesia, anemia, angioedema, aphasia, ataxia, atrioventricular block, bronchospasm, bruxism, chills, colitis, coma, coordination abnormal, cystitis, deafness, delirium, delusions, depersonalization, derealization, diplopia, dry eye, dysarthria, dyskinesia, dyspareunia, dysphoria, dystonia, ecchymosis, EEG abnormality, ejaculation abnormality, emotional lability, esophagitis, euphoria, exfoliative dermatitis, extrapyramidal syndrome, extrasystoles, facial edema, fever with rash (and other symptoms suggestive of delayed hypersensitivity resembling serum sickness), gastric reflux, gastrointestinal hemorrhage, gingivitis, glossitis, glycosuria, gum hemorrhage, gynecomastia, hallucinations, hepatic damage, hepatitis, hirsutism, hostility, hyper-/hypoglycemia, hyper-/hypokinesia, hypertonia, hypoesthesia, hypomania, impotence, intestinal perforation, intraocular pressure increased, jaundice, leg cramps, leukocytosis, leukopenia, libido increased, liver function abnormal, lymphadenopathy, maculopapular rash, malaise, manic reaction, menopause, MI, mouth ulcers, muscle rigidity, muscle weakness, musculoskeletal chest pain, mydriasis, myoclonus, neuralgia, neuropathy, painful erection, pancreatitis, pancytopenia, paranoia, paranoid reaction, phlebitis, pneumonia, photosensitivity, postural hypotension, prostate disorder, pulmonary embolism, restlessness, rhabdomyolysis, salivation increased, salpingitis, sciatica, seizure, SIADH, stomach ulcer, stomatitis, stroke, suicidal ideation, syncope, tardive dyskinesia, thirst, thrombocytopenia, tongue edema, urinary incontinence, urinary retention, vaginitis, vasodilation, vertigo

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2A6 (minor), 2B6 (major), 2C9 (minor), 2D6 (minor), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2D6 (weak)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2B6 Inducers (Strong): May increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Moderate): May decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Strong): May decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

Lopinavir: May decrease the serum concentration of BuPROPion. Concentrations of the active metabolite, hydroxybupropion, may also be decreased. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the neurotoxic (central) effect of BuPROPion. *Risk X: Avoid combination*

Ritonavir: May decrease the serum concentration of BuPROPion. *Risk C: Monitor therapy*

Tricyclic Antidepressants: BuPROPion may decrease the metabolism of Tricyclic Antidepressants. **Exceptions:** Amoxapine; Protriptyline. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, gotu kola, kava kava (may increase CNS depression).

Monitoring ParametersBody weight; mental status for depression, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased), anxiety, social functioning, mania, panic attacks

When used for the treatment of ADHD, thoroughly evaluate for cardiovascular risk. Monitor heart rate, blood pressure, and consider obtaining ECG prior to initiation (Vetter, 2008).

Reference RangeTherapeutic levels (trough, 12 hours after last dose): 50-100 ng/mL
Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Perform careful cardiovascular assessment prior to initiating therapy. Monitor blood pressure at beginning of therapy and periodically with long-term use. Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Monitor for clinical worsening and suicidality, especially at the beginning of therapy or when dose changes occur. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Patient EducationBe aware that bupropion is marketed under different names and should not be taken together; Zyban® is for smoking cessation and Wellbutrin® is for treatment of depression. **Note:** Excessive use or abrupt discontinuation of alcohol or sedatives may alter seizure threshold.

Depression: Take as directed, in equally divided doses; do not take in larger dose or more often than recommended. Do not discontinue this medicine without consulting prescriber. Do not use alcohol or OTC medications not approved by prescriber. May cause drowsiness, clouded sensorium, headache, restlessness, or agitation (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or dry mouth (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); weight loss; constipation (increased exercise, fluids, fruit, or fiber may help); or impotence (reversible). Report persistent CNS effects (eg, agitation, confusion, anxiety, restlessness, insomnia, psychosis, hallucinations, seizures); suicidal ideation; muscle weakness or tremor; skin rash or irritation; chest pain or palpitations, abdominal pain or blood in stools; yellowing of skin or eyes; or respiratory difficulty, bronchitis, or unusual cough.

Smoking cessation: Use as directed; do not take extra doses. Do not combine nicotine patches with use of Zyban® unless approved by prescriber. May cause dry mouth and insomnia (these may resolve with continued use). Report any respiratory difficulty, unusual cough, dizziness, or muscle tremors.

Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 75 mg [generic for Wellbutrin®], 100 mg [generic for Wellbutrin®]

Wellbutrin®: 75 mg, 100 mg

Tablet, extended release, as hydrochloride: 100 mg [generic for Wellbutrin® SR], 150 mg [generic for Wellbutrin® SR], 150 mg [generic for Zyban®], 200 mg [generic for Wellbutrin® SR], 300 mg [generic for Wellbutrin XL™]

Budeprion™ SR: 100 mg [generic for Wellbutrin® SR; contains tartrazine], 150 mg [generic for Wellbutrin® SR]

Budeprion XL®: 150 mg [generic for Wellbutrin® XL], 300 mg [contains tartrazine; generic for Wellbutrin® XL]

Buproban™: 150 mg [generic for Zyban®]

Wellbutrin XL™: 150 mg, 300 mg

Tablet, sustained release, as hydrochloride: 100 mg [generic for Wellbutrin® SR], 150 mg [generic for Wellbutrin® SR], 150 mg [generic for Zyban®], 200 mg [generic for Wellbutrin® SR]

Wellbutrin® SR: 100 mg, 150 mg, 200 mg

Zyban®: 150 mg

Tablets (Wellbutrin)

75 mg (90): $181.93

100 mg (90): $240.31

Mechanism of ActionAminoketone antidepressant structurally different from all other marketed antidepressants; like other antidepressants the mechanism of bupropion's activity is not fully understood. Bupropion is a relatively weak inhibitor of the neuronal uptake of norepinephrine and dopamine, and does not inhibit monoamine oxidase or the reuptake of serotonin. Metabolite inhibits the reuptake of norepinephrine. The primary mechanism of action is thought to be dopaminergic and/or noradrenergic.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: V_d: 19-21 L/kg

Protein binding: 82% to 88%

Metabolism: Extensively hepatic via CYP2B6 to hydroxybupropion; non-CYP-mediated metabolism to erythrohydrobupropion and threohydrobupropion. Metabolite activity ranges from 20% to 50% potency of bupropion.

Bioavailability: 5% to 20% in animals

Half-life:

Distribution: 3-4 hours

Elimination: 21 ± 9 hours; Metabolites: Hydroxybupropion: 20 ± 5 hours; Erythrohydrobupropion: 33 ± 10 hours; Threohydrobupropion: 37 ± 13 hours (metabolite accumulation has been noted in ESRD).

Time to peak, serum: Bupropion: ~3 hours; bupropion extended release: ~5 hours

Metabolites: Hydroxybupropion, erythrohydrobupropion, threohydrobupropion: 6 hours

Excretion: Urine (87%); feces (10%)

Pharmacotherapy PearlsRisk of seizures: When using immediate release tablets, seizure risk is increased at total daily dosage >450 mg, individual dosages >150 mg, or by sudden, large increments in dose. Data for the immediate-release formulation of bupropion revealed a seizure incidence of 0.4% in patients treated at doses in the 300-450 mg/day range. The estimated seizure incidence increases almost 10-fold between 450 mg and 600 mg per day. Data for the sustained release dosage form revealed a seizure incidence of 0.1% in patients treated at a dosage range of 100-300 mg/day, and increases to ~0.4% at the maximum recommended dose of 400 mg/day.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Abnormal taste, significant xerostomia (normal salivary flow resumes with discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsPart of the mechanism of bupropion is to block reuptake of norepinephrine along with dopamine. Because of the potential for norepinephrine elevation within CNS synapses, it is suggested that vasoconstrictor be administered with caution and to monitor vital signs in dental patients taking antidepressants that affect norepinephrine in this way.

Mental Health: Child/Adolescent ConsiderationsAttention-deficit/hyperactivity disorder (ADHD): 1.4-5.7 mg/kg/day (mean: 3.3 mg/kg/day) was utilized in 15 ADHD subjects 7-17 years of age (Barrickman, 1995); 72 children with ADHD (6-12 years of age) received 3-6 mg/kg/day (Conners, 1996); adolescents with conduct disorder and substance use disorder were titrated to a maximum fixed daily dose of 300 mg (Riggs, 1998). The immediate-release dosage form was studied in clinical trials for indications other than depression in 104 pediatric patients. This limited exposure does not allow for assessment of the safety of bupropion in pediatric patients. Bupropion 100–350 mg/day (mean: 3.5 ± 0.8 mg/kg/day) was given to 57 children and adolescents 9–18 years of age with ADHD in a randomized controlled trial to assess whether it prevented smoking in nonsmokers for ≤6.5 years (mean: 12 months). Bupropion was not found to be superior to placebo for smoking prevention in youth with ADHD. Adverse effects were similar in bupropion and placebo groups (Monuteaux, 2007).

A pharmacokinetic study of bupropion SR, showed the mean half-life and threohydrobupropion metabolite of bupropion were significantly shorter in children 11-17 years of age compared to adults. The AUC were 19% and 80% higher for bupropion and its metabolite (respectively). This indicates it may be preferable to dose bupropion SR twice daily in children (Daviss, 2005).

Riggs PD, Leon SL, Mikulich SK, et al, “An Open Trial of Bupropion for ADHD in Adolescents With Substance Use Disorders and Conduct Disorder,” *J Am Acad Child Adolesc Psychiatry*, 1998, 37(12):1271-8.

Mental Health Comment Bupropion is an activating antidepressant that may be particularly useful for individuals whose depression is associated with fatigue and poor concentration. It is also used as an adjunct in smoking cessation and may benefit those with ADHD. While some evidence suggests that it is less likely to induce mania when used in individuals with bipolar disorder, the trials suggesting this are flawed. It is not associated with withdrawal symptoms so it can be stopped abruptly. Sexual dysfunction, seen commonly with the SSRI, is less problematic with bupropion.

Cardiovascular Considerations There are relatively few cardiovascular side effects compared to tricyclic antidepressants. However, several case reports include cardiovascular complications, including hypotension, hypertension, and MI. Use with caution in patients with recent MI or unstable angina. Recent information suggests that hypertension, in some cases severe and requiring acute treatment, has been reported in patients receiving bupropion alone, and especially when bupropion is used in conjunction with nicotine replacement therapy. These events have been observed in both patients with and without evidence of pre-existing hypertension. Data from a comparative study of sustained-release bupropion, nicotine transdermal system (NTS), the combination of sustained-release bupropion and NTS, and placebo suggest a higher incidence of treatment-emergent hypertension (>6%) in patients treated with the combination of sustained-release bupropion and NTS. The majority of these patients had evidence of pre-existing hypertension. Monitoring of blood pressure is recommended in patients receiving the combination of bupropion and nicotine replacement, particularly in those with hypertension and/or significant coronary artery disease. Possible potential problems need to be balanced against the very substantial benefits of smoking cessation.

Anesthesia and Critical Care Concerns/Other Considerations There are relatively few cardiovascular side effects compared to tricyclic antidepressants. However, several case reports include cardiovascular complications, including hypotension and MI. Use with caution in patients with recent MI or unstable angina. Recent information suggests that hypertension, in some cases severe and requiring acute treatment, has been reported in patients receiving bupropion alone, and especially when bupropion is used in conjunction with nicotine replacement therapy. Monitoring of blood pressure is recommended in patients receiving the combination of bupropion and nicotine replacement, particularly in those with hypertension and/or significant coronary artery disease.

Medication Safety Issues

Sound-alike/look-alike issues:

Suprefact® may be confused with Suprane®

Pronunciation(BYOO se rel in)

Canadian Brand NamesSuprefact®; Suprefact® Depot

Pharmacologic CategoryGonadotropin Releasing Hormone Agonist

Use: Labeled IndicationsPalliative treatment in patients with hormone-dependent advanced prostate cancer (stage D); treatment of endometriosis in women who do not require surgical intervention as first-line therapy (length of therapy is usually 6 months, but no longer than 9 months)

Use: Unlabeled/InvestigationalDiagnostic test for hypogonadotropic hypogonadism in males with delayed puberty

Dosing: Adults

Prostate cancer:Note: Administration of an antiandrogen agent beginning 7 days prior to initiation of buserelin therapy and continuing for ~5 weeks with buserelin therapy is recommended in patients with prostate cancer.

Sub Q:

Suprefact®: Initial: 500 mcg every 8 hours for 7 days. Maintenance: 200 mcg once daily

Suprefact Depot®

2-month: 6.3 mg implant injected into lateral abdominal wall every 8 weeks

3-month: 9.45 mg injected into lateral abdominal wall every 12 weeks

Intranasal (Suprefact®): Maintenance: 400 mcg (200 mcg into each nostril) 3 times/day

Endometriosis: Intranasal (Suprefact®): 400 mcg (200 mcg into each nostril) 3 times/day for 6-9 months

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Delayed puberty diagnostic test (unlabeled use):** Male: SubQ: 100 mcg once

Dosing: Renal ImpairmentNo adjustment necessary.

Dosing: Hepatic ImpairmentNo adjustment necessary.

Administration: InhalationAdminister at equal time intervals; before first application pump bottle several times in upright position until a uniform mist is released; priming may need to be repeated between uses

Administration: OtherSubQ: Rotate injection sites; administer at equal time intervals; a local anesthetic may be administered to injection site prior to implantation of depot

Storage

Injection: Store at room temperature of 15°C to 30°C (59°F to 86°F); do not freeze. Protect from light.

Depot: Store at room temperature of 15°C to 30°C (59°F to 86°F); protect from excessive heat.

Nasal solution: Store at room temperature of 15°C to 30°C (59°F to 86°F); do not freeze. Protect from light. Store in upright position.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to buserelin or any component of the formulation; patients with nonhormone-dependent prostate cancer; patients who have undergone orchiectomy; patients with undiagnosed abnormal vaginal bleeding; pregnancy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid reactions: Reactions including allergic asthma with dyspnea as well as rare anaphylactic/anaphylactoid shock have been observed in buserelin treated patients.
- Exacerbation of disease: A transient (usual duration <10 days) exacerbation of the signs and symptoms of the disease process may be observed with the initiation of therapy. Adjunctive antiandrogen therapy is recommended for patients with prostate cancer to minimize exacerbations.
- Pituitary adenoma: The development of pituitary adenomas may rarely be seen with long-term therapy.

Disease related concerns:

- Depression: Monitor patients with a history of depression and treat appropriately where indicated.

- Diabetes: Reduced glucose tolerance has been noted in rare cases. Use caution in patients with diabetes.

- Endometriosis: A transient exacerbation of the signs/symptoms may be associated with the initiation of therapy. Oral contraceptives should be discontinued prior to starting therapy; use of a nonhormonal contraceptive is recommended.

- Hypertension: Increases in blood pressure (including hypertensive crisis) may occur in patients being treated for hypertension. Monitor blood pressure regularly.

- Osteoporosis: Treatment inducing a hypoestrogenic state may lead to changes in bone density. The benefits and risks of potential buserelin therapy should be considered before treatment is initiated. Patients at risk for reduced bone density include those with chronic alcohol and/or tobacco use, family history of osteoporosis, and chronic treatment with anticonvulsants or corticosteroids. Use of buserelin for >6 months or in association with other risk factors may contribute to additional bone loss.

- Prostate cancer: Initiation of therapy without a concomitant antiandrogen agent may lead to a transient worsening of symptoms including bone pain, weakness of leg muscles, impaired micturition, hydronephrosis, lymphostasis, or thrombosis with pulmonary embolus. Caution and close monitoring should be used in patients with vertebral metastases who are at risk for lesion exacerbation with possible spinal cord compression; initiate antiandrogen therapy 7 days prior to beginning buserelin therapy and continue for 5 weeks with buserelin therapy. Reversal of hypogonadism induced by therapy has not been established in this patient population.

- Urinary obstruction: In patients with prostatic disease, a transient increase in patient symptoms may occur early in therapy. Monitor for signs of obstruction, urinary retention.

Other warnings and precautions:

- Pediatrics: Safety and efficacy have not been established in patients <18 years of age.

Pregnancy ConsiderationsBuserelin is contraindicated in pregnant women. Patients should employ a nonhormonal method of contraception during therapy. Ovulation may occur with a missed dose; in the event a patient conceives, therapy should be discontinued.

LactationEnters breast milk/not recommended

Adverse Reactions**Note:** Adverse reaction profile differs based on population/medication and route of administration.

Depot:

>10%:

Endocrine & metabolic: Hot flushes (14% to 23%)

Genitourinary: Impotence (2% to 23%)

Neuromuscular & skeletal: Weakness (<1% to 14%)

1% to 10%:

Cardiovascular: Hypertension (2% to 9%), palpitation (5%), edema (1%)

Central nervous system: Dizziness (5%), insomnia (<1% to 5%), depression (2%), pain (2%)

Endocrine & metabolic: Libido decreased (2% to 5%)

Gastrointestinal: Appetite increased (5%), nausea (5%)

Local: Injection site reaction (1% to 5%)

Neuromuscular & skeletal: Arthralgia (5%), myalgia (5%)

SubQ or intranasal:

>10%:

Central nervous system: Headache (20% to 29%)

Endocrine & metabolic: Libido decreased (12% to 85%), hot flushes (66% to 72%), vaginal dryness (29%), menorrhagia (24%)

Genitourinary: Impotence (75% to 80%)

Local: Injection site reaction (8% to 12%)

1% to 10%:

Cardiovascular: Edema (1% to 5%), palpitation (1% to 5%)

Central nervous system: Dizziness (9%), depression (8%), emotional lability (7%), anxiety (1% to 5%), hostility (1% to 5%), insomnia (1% to 5%), migraine (1% to 5%), nervousness (1% to 5%), pain (1% to 5%), malaise, sleep disorder

Dermatologic: Acne (5%), dry skin (1% to 5%), purpura (1% to 5%), skin disorder (1% to 5%), flare reaction (1% to 2%), pruritus

Endocrine & metabolic: Breast pain (1% to 5%), hirsutism (1% to 5%), menstrual disorder (1% to 5%), gynecomastia (1% to 2%), premenstrual syndrome

Gastrointestinal: Nausea (5% to 7%), constipation (1% to 5%), diarrhea (1% to 5%), gastrointestinal fullness (1% to 5%), taste perversion (1% to 5%), weight loss/gain (1% to 5%), xerostomia (1% to 2%), flatulence, sore throat, vomiting

Genitourinary: Dyspareunia (1% to 5%), vaginitis (1% to 5%), leukorrhea, pelvic pain, vaginal discharge, vaginal discomfort

Neuromuscular & skeletal: Weakness (7%), arthralgia (1% to 5%), myalgia (1% to 5%), neck rigidity (1% to 5%), paresthesia (1% to 5%), back pain

Respiratory: Upper respiratory infection (1% to 5%), rhinitis (1% to 5%), dry nose (1% to 2%)

Miscellaneous: Diaphoresis (1% to 2%), infection

All formulations: <1%, postmarketing, and/or case reports: Abnormal ejaculation, abnormal thinking, allergic reaction, amnesia, anorexia, arthritis, bilirubin increased, blurred vision, breast atrophy, chronic intestinal pseudo-obstruction, constipation, diabetes mellitus, drowsiness, dry eye, dyspnea, ear pain, epistaxis, exacerbation, fatigue, feminization (males), gastrointestinal pain, heart failure, hyperalgesia, hypercholesterolemia, hyperglycemia, hyperlipidemia, injection site hemorrhage, male genital pain, leukopenia, myeloid metaplasia, myopathy, ovarian cysts, pharyngitis, photosensitivity, pituitary adenoma, polydipsia, pyrexia, rash, suicide attempt, syncope, tachycardia, temporary blindness, thrombopenia, thrombophlebitis, thrombosis, tinnitus, transaminases increased, urinary retention, vaginal hemorrhage, vasodilation, vertigo

Drug Interactions

Antidiabetic Agents: Luteinizing Hormone-Releasing Hormone Analogs may diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Monitoring ParametersSerum testosterone levels (4-6 weeks after initiation of therapy and every 3 months thereafter), serum estradiol levels, prostate specific antigen (PSA), prostatic acid phosphatase (PAP), blood glucose levels(in patients with diabetes); bone scan, CT scan, ultrasound; digital rectal exam; blood pressure; mood changes

Hypogonadotropic hypogonadism testing (unlabeled use): Serum LH and FSH 4 hours after administration

Monitoring: Lab TestsSerum testosterone levels (4-6 weeks after initiation of therapy and every 3 months thereafter), serum estradiol levels, prostate specific antigen (PSA), prostatic acid phosphatase (PAP), blood glucose levels(in patients with diabetes)

Hypogonadotropic hypogonadism testing (unlabeled use): Serum LH and FSH 4 hours after administration

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, solution:

Suprefact® [CAN]: 1 mg/mL (5.5 mL, 10 mL) [contains benzyl alcohol] [not available in U.S.]

Solution, intranasal:

Suprefact® [CAN]: 1mg/1mL (10 mL) [contains benzalkonium chloride] [not available in U.S.]

Implant, subcutaneous:

Suprefact® [CAN] Depot: 6.3 mg [released over 2 months]; 9.45 mg [released over 3 months] [not available in U.S.]

ManufacturerSanofi-Aventis

Mechanism of ActionSynthetic peptide analog of Gonadotropin hormone releasing hormone (GnRH) with substitutions at positions 6 and 10; altered peptide structure results in a significantly magnified GnRH agonist effect with an extended duration of activity. Following an initial rise in the pituitary gonadotropins luteinizing hormone (LH) and follicle-stimulating hormone (FSH), chronic administration of buserelin results in a sustained suppression of LH and FSH and an interference with the production of ovarian and testicular steroids. Eventually, a decline in gonadal steroids to castration levels is observed.

Pharmacodynamics/Kinetics

Protein binding: 15%

Metabolism: Plasma; inactive metabolites

Half-life elimination: 70-80 minutes; Depot implants: 20-30 Days

Time to peak, plasma: Depot: <1 day

Excretion: Urine (67% as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsBuserelin may cause hypertension and palpitations. Monitor blood pressure prior to dental procedures if using local anesthesia with vasoconstrictor. There have been no reports of any direct interaction with buserelin and vasoconstrictor.

Mental Health: Effects on Mental StatusMay cause dizziness, insomnia, depression, emotional lability, anxiety, hostility, or nervousness

Mental Health: Effects on Psychiatric TreatmentSexual dysfunction is common; concurrent use with psychotropics may produce additive effects

Index TermsBuserelin Acetate

Medication Safety Issues

Sound-alike/look-alike issues:

BusPIRone may be confused with buPROPion

Pronunciation(byoo SPYE rone)

U.S. Brand NamesBuSpar®

Canadian Brand NamesApo-Buspirone®; BuSpar®; Buspirex; Bustab®; CO Buspirone; Dom-Buspirone; Gen-Buspirone; Lin-Buspirone; Novo-Buspirone; Nu-Buspirone; PMS-Buspirone; ratio-Buspirone; Riva-Buspirone

Pharmacologic CategoryAntianxiety Agent, Miscellaneous

Use: Labeled IndicationsManagement of generalized anxiety disorder (GAD)

Use: Unlabeled/InvestigationalManagement of aggression in mental retardation and secondary mental disorders; major depression; potential augmenting agent for antidepressants; premenstrual syndrome

Dosing: AdultsAnxiety disorders (GAD): Oral: 15 mg/day (7.5 mg twice daily); may increase in increments of 5 mg/day every 2-3 days to a maximum of 60 mg/day. Target dose for most people is 20-30 mg/day (10-15 mg twice daily).

Dosing: ElderlyOral: Initial: 5 mg twice daily, increase by 5 mg/day every 2-3 days as needed up to 20-30 mg/day; maximum daily dose: 60 mg/day (see Geriatric Considerations).

Dosing: PediatricGeneralized anxiety disorder (GAD): Children ≥6 years and Adolescents: Oral: Initial: 5 mg daily; increase in increments of 5 mg/day at weekly intervals as needed, to a maximum dose of 60 mg/day divided into 2-3 doses

Dosing: Renal ImpairmentPatients with impaired renal function demonstrated increased plasma levels and a prolonged half-life of buspirone. Use in patients with severe renal impairment not recommended.

Dosing: Hepatic ImpairmentPatients with impaired hepatic function demonstrated increased plasma levels and a prolonged half-life of buspirone. Use in patients with severe hepatic impairment not recommended.

StorageStore at USP controlled room temperature of 25°C (77°F). Protect from light.

ContraindicationsHypersensitivity to buspirone or any component of the formulation

Allergy Considerations

- BusPIRone Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cognitive/motor impairment: Low potential for cognitive or motor impairment; until effects on patient known, patients should be warned to use caution when performing tasks which require mental alertness (eg, operating machinery or driving).
- Restlessness syndrome: Has been reported in small number of patients; may be attributable to buspirone’s antagonism of central dopamine receptors. Monitor for signs of any dopamine-related movement disorders (eg, dystonia, akathisia, pseudo-parkinsonism)

Disease-related concerns:

- Hepatic impairment: Use in patients with severe hepatic impairment is not recommended.
- Renal impairment: Use in patients with severe renal impairment is not recommended.

Concurrent drug therapy issues:

- MAO inhibitors: Use with MAO inhibitors may result in hypertensive reactions; concurrent use is not recommended.

Special populations:

- Pediatrics: Safety and efficacy of buspirone have not been established in children <6 years of age. No long-term safety/efficacy data available in children.

Other warnings/precautions:

- Sedative/hypnotic withdrawal: Buspirone does not exhibit cross-tolerance with benzodiazepines or other sedative/hypnotic agents. If substituting buspirone for any of these agents, gradually withdraw the drug(s) prior to initiating buspirone.

Geriatric ConsiderationsBecause buspirone is less sedating than other anxiolytics, it may be a useful agent in geriatric patients when an anxiolytic is indicated.

Pregnancy Risk FactorB

Pregnancy ConsiderationsNo impairment of fertility or fetotoxic effects were noted in animal studies with doses 30 times maximum recommended human dose. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%: Central nervous system: Dizziness (12%)

1% to 10%:

Cardiovascular: Chest pain (>1%)

Central nervous system: Drowsiness (10%), headache (6%), nervousness (5%), lightheadedness (3%), anger/hostility (2%), confusion (2%), excitement (2%), dream disturbance (≥1%)

Dermatologic: Rash (1%)

Gastrointestinal: Nausea (8%), diarrhea (2%)

Neuromuscular & skeletal: Numbness (2%), weakness (2%), musculoskeletal pain (1%), paresthesia (1%), incoordination (1%), tremor (1%)

Ocular: Blurred vision (2%)

Otic: Tinnitus (≥1%)

Respiratory: Nasal congestion (≥1%), sore throat (≥1%)

Miscellaneous: Diaphoresis (1%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Akathisia, allergic reaction, angioedema, anorexia, bradycardia, bruising, cardiomyopathy, cogwheel rigidity, conjunctivitis, CVA, dyskinesia, dyspnea, dystonia, edema, enuresis, eosinophilia, epistaxis, EPS, galactorrhea, hallucination, heart failure, hyper-/hypotension, hyperventilation, irritable colon, leukopenia, menstrual irregularity, MI, muscle spasms, parkinsonism, personality disorders, PID, psychosis, rectal bleeding, restless leg syndrome, seizure, serotonin syndrome, suicidal ideation, syncope, thrombocytopenia, thyroid abnormality, transaminase increases, visual disturbances (tunnel vision)

Metabolism/Transport Effects

Substrate of CYP2D6 (minor), 3A4 (major)

Drug Interactions

Antidepressants (Serotonin Reuptake Inhibitor/Antagonist): BusPIRone may enhance the serotonergic effect of Antidepressants (Serotonin Reuptake Inhibitor/Antagonist). This may cause serotonin syndrome. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of BusPIRone. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

MAO Inhibitors: BusPIRone may enhance the adverse/toxic effect of MAO Inhibitors. Elevated blood pressure has been reported. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: BusPIRone may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. Selective Serotonin Reuptake Inhibitors may decrease the metabolism of BusPIRone. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Ethanol (may increase CNS depression).

Food: Food may decrease the absorption of buspirone, but it may also decrease the first-pass metabolism, thereby increasing the bioavailability of buspirone. Grapefruit juice may cause increased buspirone concentrations; avoid intake of large quantities of grapefruit juice.

Herb/Nutraceutical: St John's wort may decrease buspirone levels or increase CNS depression. Avoid valerian, gotu kola, kava kava (may increase CNS depression).

Monitoring ParametersMental status, symptoms of anxiety

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake only as directed; do not increase dose or take more often than prescribed. May take 2-3 weeks to see full effect; do not discontinue this medicine without consulting prescriber. Avoid large quantities of grapefruit juice. Do not use alcohol or other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or upset stomach, nausea (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report persistent vomiting; chest pain or rapid heartbeat; persistent CNS effects (eg, confusion, restlessness, anxiety, insomnia, excitation, headache, dizziness, fatigue, impaired coordination); or worsening of condition. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 5 mg, 7.5 mg, 10 mg, 15 mg, 30 mg

BuSpar®: 5 mg, 10 mg, 15 mg, 30 mg

Generic AvailableYes

ManufacturerBristol-Myers Squibb Company (Pharmaceutical Division)

Pricing: U.S. (www.drugstore.com)

Tablets (BuSpar)

5 mg (60): $67.99

10 mg (60): $109.99

15 mg (60): $169.97

30 mg (30): $147.73

Tablets (BusPIRone HCl)

5 mg (30): $14.00

7.5 mg (60): $45.99

10 mg (90): $19.00

15 mg (90): $69.31

30 mg (30): $50.99

Mechanism of ActionThe mechanism of action of buspirone is unknown. Buspirone has a high affinity for serotonin 5-HT$_{1A}$ and 5-HT$_2$ receptors, without affecting benzodiazepine-GABA receptors. Buspirone has moderate affinity for dopamine D$_2$ receptors.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: V$_d$: 5.3 L/kg

Protein binding: 86% to 95%

Metabolism: Hepatic oxidation, primarily via CYP3A4; extensive first-pass effect

Bioavailability: ~4%

Half-life elimination: 2-3 hours

Time to peak, serum: 40-90 minutes

Excretion: Urine: 29% to 63% (<0.1% dose excreted unchanged); feces: 18% to 38%

Related Information

- Nonbenzodiazepine Anxiolytics and Hypnotics
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsHas shown little potential for abuse; needs continuous use. Because of slow onset, not appropriate for “as needed” (prn) use or for brief, situational anxiety. Ineffective for treatment of benzodiazepine or ethanol withdrawal.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Child/Adolescent ConsiderationsAnxiety disorders: One pilot study of 15 children, 6-14 years of age (mean: 10 years), with mixed anxiety disorders, used initial doses of 5 mg/day; doses were individualized with increases in increments of 5 mg/day weekly as needed, to a maximum dose of 20 mg/day divided into 2 doses (mean dose required: 18.6 mg/day). Some authors (Carrey, 1996 and Kutcher, 1992), based on their clinical experience, recommend higher doses. Open-label study in 25 prepubertal inpatients (mean age: 8 years) with anxiety symptoms and moderately-aggressive behavior utilized a mean optimal dose of 28 mg/day (Pfeffer, 1997). Dosages ranging from 15-45 mg/day were utilized in children 6-17 years of age with pervasive developmental disorders (Buitelaar, 1998). The safety and efficacy of buspirone were evaluated in two placebo-controlled 6-week trials involving a total of 559 pediatric patients (6-17 years of age) with generalized anxiety disorder (GAD). Doses studied were 7.5-30 mg twice daily (15-60 mg/day). There were no significant differences between buspirone and placebo with regard to the symptoms of GAD following doses recommended for the treatment of GAD in adults (Bristol-Myers Squibb, BuSpar® package labeling, July 2001).

An open-label pharmacokinetic study was conducted in children (n=13), adolescents (n=12) with anxiety disorders, and healthy adults (n=14) to measure blood levels and adverse effects over 3 weeks. Children had the highest blood levels, significantly higher than adults on all doses studied. The most frequently reported adverse events in children and adolescents were lightheadedness (68%), headache (48%), and dyspepsia (20%); two children withdrew from the study at the higher doses (15 mg and 30 mg twice daily) due to adverse effects (Salazar, 2001).

Salazar DE, Frackiewicz EJ, Dockens R, et al, "Pharmacokinetics and Tolerability of Buspirone During Oral Administration to Children and Adolescents With Anxiety Disorder and Normal Healthy Adults," *J Clin Pharmacol*, 2001, 41(12):1351-8.

Mental Health CommentBuspirone is an azaspirodecanedione (nonbenzodiazepine) anxiolytic and is not GABA-ergic. It is extensively metabolized primarily by oxidation producing several hydroxylated derivatives and a pharmacologically-active metabolite, 1-pyrimidinyl piperazine (1-PP). 1-PP has about 20% the activity of buspirone. Buspirone decreases anxiety without causing sedation or having anticonvulsant or muscle relaxant properties. Initial therapeutic effect is usually seen as a decrease in irritability and worry. Buspirone may be as effective as the benzodiazepines in relieving anxiety, but has a slow onset of action. It is important to wait 3-4 weeks before assessing the response to buspirone.

The advantages of buspirone include a low abuse potential (no reinforcing value in substance abusers and tended to cause dysphoria at doses >40 mg/day), causes no impairment of psychomotor activity, is not associated with dependence and can be abruptly discontinued, produces minimal sedation, and does not potentiate the effects of alcohol. May be useful for those who become disinhibited on benzodiazepines, those with a history of benzodiazepines/substance abuse, and those with a medical history in whom the use of a benzodiazepines may be risky.

The disadvantages of buspirone include a lag time for onset of anxiolytic effect similar to antidepressants, the requirement for multiple daily dosing, an inability to use as a PRN medication, a lack of cross tolerance with benzodiazepines, an inability to prevent withdrawal from benzodiazepines or alcohol, the requirement for adherent patients, and the potential for patients with previous exposure to benzodiazepines to be less likely to respond. For these reasons, buspirone is uncommonly utilized as an anxiolytic in most clinical settings.

Anesthesia and Critical Care Concerns/Other ConsiderationsTakes 2-3 weeks for full effect. Because of slow onset, not appropriate for “as needed” (prn) use or for brief, situational anxiety; not effective for severe anxiety; does not show cross-tolerance with benzodiazepines or other sedatives; less sedating than other anxiolytics; has shown little potential for abuse; needs continuous use; ineffective for benzodiazepine or ethanol withdrawal

Index TermsBuspirone Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

Busulfan may be confused with Butalan®

Myleran® may be confused with Alkeran®, Leukeran®, melphalan, Mylicon®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(byoo SUL fan)

U.S. Brand NamesBusulfex®; Myleran®

Canadian Brand NamesBusulfex®; Myleran®

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent

Use: Labeled Indications

Oral: Chronic myelogenous leukemia (CML); conditioning regimens for bone marrow transplantation

I.V.: Combination therapy with cyclophosphamide as a conditioning regimen prior to allogeneic hematopoietic progenitor cell transplantation for chronic myelogenous leukemia

Use: Unlabeled/InvestigationalOral: Bone marrow disorders, such as polycythemia vera and myeloid metaplasia; thrombocytosis

Dosing: Adults**Note:** Premedicate with prophylactic anticonvulsant therapy (eg, phenytoin) prior to high-dose busulfan treatment.

CML remission induction: Oral: 60 mcg/kg/day or 1.8 mg/m^2/day; usual range: 4-8 mg/day (may be as high as 12 mg/day); Maintenance doses: 1-4 mg/day to 2 mg/week to maintain WBC 10,000-20,000 cells/mm^3

BMT marrow-ablative conditioning regimen:

Oral: 1 mg/kg/dose (ideal body weight) every 6 hours for 16 doses

I.V.: 0.8 mg/kg (ideal body weight or actual body weight, whichever is lower); for obese or severely-obese patients adjusted ideal body weight is recommended) every 6 hours for 4 days (a total of 16 doses)

Polycythemia vera (unlabeled use): Oral: 2-6 mg/day

Thrombocytosis (unlabeled use): Oral: 4-6 mg/day

Dosing: ElderlyOral (refer to individual protocols): Start with lowest recommended doses for adults.

Dosing: Pediatric**Note:** Premedicate with prophylactic anticonvulsant therapy (eg, phenytoin) prior to high-dose busulfan treatment.

CML remission: Oral: Induction: 0.06-0.12 mg/kg/day **or** 1.8-4.6 mg/m^2/day; titrate dosage to maintain leukocyte count above 40,000/mm^3; reduce dosage by 50% if the leukocyte count reaches 30,000-40,000/mm^3; discontinue drug if counts fall to ≤20,000/mm^3.

BMT marrow-ablative conditioning regimen:

Oral: 1 mg/kg/dose (ideal body weight) every 6 hours for 16 doses

I.V.:

≤12 kg: 1.1 mg/kg/dose (ideal body weight) every 6 hours for 16 doses

>12 kg: 0.8 mg/kg/dose (ideal body weight) every 6 hours for 16 doses

Adjust dose to desired AUC [1125 µmol(min)] using the following formula:

Adjusted dose (mg) = Actual dose (mg) x [target AUC µmol(min) / actual AUC µmol(min)]

Dosing: Renal ImpairmentI.V.: Has not been studied in patients with renal impairment per the FDA-approved labeling. Some clinicians suggest adjustment is not necessary (Aronoff, 2007).

Dosing: Hepatic Impairment I.V.: Has not been administered in clinical studies in patients with hepatic impairment per the FDA-approved labeling. Busulfan has extensive hepatic metabolism and risk of hepatic veno-occlusive disease with high doses; dosage adjustment may be needed.

Oncology: Bone Marrow - High Dose**Note:** Generally combined with other high-dose chemotherapeutic drugs or total body irradiation.

Oral:

0.875-1 mg/kg/dose every 6 hours for 16 doses; total dose: 12-16 mg/kg

37.5 mg/m^2 every 6 hours for 16 doses; total dose: 600 mg/m^2 (studied primarily in pediatric patients)

150 mg/m^2 daily for 4 days; total dose: 600 mg/m^2 (studied primarily in pediatric patients)

I.V.: 0.8 mg/kg every 6 hours for 16 doses (4 days)

Calculations

- Body Surface Area: Pediatrics
- Ideal Body Weight: Adults
- Ideal Body Weight: Pediatrics

Administration: I.V.Intravenous busulfan should be administered as a 2-hour via central line.
Administration: Oral**BMT only:** To facilitate ingestion of high oral doses, insert multiple tablets into gelatin capsules.
Storage

Injection: Store unopened ampuls and vials under refrigeration (2°C to 8°C). Final solution is stable for up to 8 hours at room temperature (25°C); the infusion must be completed within that 8-hour timeframe. Dilution of busulfan injection in 0.9% sodium chloride is stable for up to 12 hours at refrigeration (2°C to 8°C); the infusion must be completed within that 12-hour timeframe.

Tablet: Store at room temperature at 15°C to 30°C (59°F to 86°F).

ReconstitutionInjection: Dilute (using manufacturer provided 5-micron filters for ampuls) in 0.9% sodium chloride injection or dextrose 5% in water. The dilution volume of busulfan injection, ensuring that the final concentration of busulfan is 0.5 mg/mL.
Compatibility**Variable stability (consult detailed reference)** in D_5W, NS.
ContraindicationsHypersensitivity to busulfan or any component of the formulation; oral busulfan is contraindicated in patients without a definitive diagnosis of CML
Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See "Concerns related to adverse effects" below.

- Experienced physician: See "Other warnings/precautions" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: Severe bone marrow suppression is common, resulting in possibly prolonged pancytopenia.** May result in severe neutropenia, thrombocytopenia, and/or anemia.

- Cardiovascular: Cardiac tamponade has been reported in children with thalassemia treated with high dose oral busulfan in combination with cyclophosphamide,

- Hepatic veno-occlusive disease: High busulfan area under the concentration versus time curve (AUC) values (>1500 µM/minute) are associated with increased risk of hepatic veno-occlusive disease (VOD) during conditioning for allogenic BMT. Patients with a history of radiation therapy, prior chemotherapy (≥3 cycles) and prior stem cell transplantation are also at increased risk of hepatic VOD at recommended doses regimens. Oral busulfan doses above 16 mg/kg (based on IBW) and concurrent use with alkylating agents may also increase the risk for hepatic VOD.

- Ovarian failure: Use has been associated with ovarian failure (including failure to achieve puberty) and amenorrhea.

- Pulmonary toxicity: May cause delayed pulmonary toxicity (known as "busulfan lung" − bronchopulmonary dysplasia with pulmonary fibrosis); may occur between 4 months and 10 years after treatment (the average onset is 4 years).

- Secondary malignancies: Tumors and acute leukemias have been reported following use.

- Seizures: Have been reported with use; initiate prophylactic anticonvulsant therapy (eg, phenytoin) prior to treatment.

Disease-related concerns:

- Seizures: Use with caution in patients predisposed to seizures, with a history of seizures or head trauma; initiate prophylactic anticonvulsant therapy (eg, phenytoin) prior to treatment.

Dosage form specific issues:

- Dimethylacetamide (DMA): The solvent in I.V. busulfan, DMA, may impair fertility. DMA may also be associated with hepatotoxicity, hallucinations, somnolence, lethargy, and confusion.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Geriatric ConsiderationsToxicity to immunosuppressives is increased in the elderly. Start with lowest recommended adult doses. Signs of infection, such as fever and rise in WBCs, may not occur. Lethargy and confusion may be more prominent signs of infection.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenic effects. May cause fetal harm if administered during pregnancy. The solvent in I.V. busulfan, DMA, is associated with teratogenic effects and may impair fertility. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should avoid pregnancy while receiving treatment.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the tumorigenicity potential and the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

I.V.:

>10%:

Cardiovascular: Tachycardia (44%), hypertension (36%; grades 3/4: 7%), edema (28% to 79%), thrombosis (33%), chest pain (26%), vasodilation (25%), hypotension (11%; grades 3/4: 3%)

Central nervous system: Insomnia (84%), fever (80%), anxiety (72% to 75%), headache (69%), chills (46%), pain (44%), dizziness (30%), depression (23%), confusion (11%)

Dermatologic: Rash (57%), pruritus (28%), alopecia (2% to 15%)

Endocrine & metabolic: Hypomagnesemia (77%), hyperglycemia (66%; grades 3/4: 15%), hypokalemia (64%), hypocalcemia (49%), hypophosphatemia (17%)

Gastrointestinal: Nausea (98%), mucositis/stomatitis (97%; grades 3/4: 26%), vomiting (43% to 95%), anorexia (85%), diarrhea (84%; grades 3/4: 5%), abdominal pain (72%), dyspepsia (44%), constipation (38%), xerostomia (26%), rectal disorder (25%), abdominal fullness (23%)

Hematologic: Myelosuppression (≤100%), neutropenia (100%; median recovery: 13 days), thrombocytopenia (98%; median onset: 5-6 days), lymphopenia (children: 79%), anemia (69%)

Hepatic: Hyperbilirubinemia (49%; grades 3/4: 30%), ALT increased (31%; grades 3/4: 7%), veno-occlusive disease (adults: 8% to 12%; children: 21%), jaundice (12%)

Local: Injection site inflammation (25%), injection site pain (15%)

Neuromuscular & skeletal: Weakness (51%), back pain (23%), myalgia (16%), arthralgia (13%)

Renal: Creatinine increased (21%), oliguria (15%)

Respiratory: Rhinitis (44%), lung disorder (34%), cough (28%), epistaxis (25%), dyspnea (25%), pneumonia (children: 21%), hiccup (18%), pharyngitis (18%)

Miscellaneous: Infection (51%), allergic reaction (26%)

1% to 10%:

Cardiovascular: Arrhythmia (5%), cardiomegaly (5%), atrial fibrillation (2%), ECG abnormal (2%), heart block (2%), heart failure (grade 3/4: 2%), pericardial effusion (2%), tamponade (children with thalassemia: 2%), ventricular extrasystoles (2%), hypervolemia

Central nervous system: Lethargy (7%), hallucination (5%), agitation (2%), delirium (2%), encephalopathy (2%), seizure (2%), somnolence (2%), cerebral hemorrhage (1%)

Dermatologic: Vesicular rash (10%), vesiculobullous rash (10%), skin discoloration (8%), maculopapular rash (8%), acne (7%), exfoliative dermatitis (5%), erythema nodosum (2%)

Endocrine & metabolic: Hyponatremia (2%)

Gastrointestinal: Ileus (8%), weight gain (8%), hematemesis (2%), pancreatitis (2%)

Hematologic: Prothrombin time increased (2%)

Hepatic: Hepatomegaly (6%)

Renal: Hematuria (8%), dysuria (7%), hemorrhagic cystitis (grade 3/4: 7%), BUN increased (3%)

Respiratory: Asthma (8%), alveolar hemorrhage (5%), hyperventilation (5%), hemoptysis (3%), pleural effusion (3%), sinusitis (3%), atelectasis (2%), hypoxia (2%)

Oral: Frequency not defined:

Central nervous system: Seizure

Dermatologic: Hyperpigmentation of skin (busulfan tan 5% to 10%), alopecia, rash, urticaria

Endocrine & metabolic: Amenorrhea, ovarian suppression

Hematologic: Myelosuppression (anemia, leukopenia, thrombocytopenia), pancytopenia

I.V. and/or Oral: Infrequent, postmarketing, and/or case reports: Acute leukemias, adrenal suppression, alopecia (permanent), aplastic anemia (may be irreversible), azoospermia, blurred vision, cataracts, cheilosis, cholestatic jaundice, corneal thinning, dry skin, endocardial fibrosis, erythema multiforme, erythema nodosum, esophageal varices, gynecomastia, hemorrhagic cystitis, hepatic dysfunction, hepatocellular atrophy, hyperuricemia, hyperuricosuria, interstitial pulmonary fibrosis (busulfan lung; manifested by a diffuse interstitial pulmonary fibrosis and persistent cough, fever, rales, and dyspnea; may be relieved by corticosteroids); malignant tumors, myasthenia gravis, ocular (lens) changes, ovarian failure, porphyria cutanea tarda, radiation myelopathy, radiation recall (skin rash), sepsis, sterility, testicular atrophy

Oncology: VesicantNo
Oncology: Emetic Potential

Low-dose: Very low (<10%)

High-dose: Moderate-to-high (30% to 90%)

Oncology: Bone Marrow - Unique Toxicity

Central nervous system: Generalized or myoclonic seizures and loss of consciousness, abnormal electroencephalographic findings

Gastrointestinal: Mucositis, anorexia, moderately emetogenic

Hepatic: Veno-occlusive disease (VOD), hyperbilirubinemia

Respiratory: Idiopathic pneumonia syndrome

Miscellaneous: Transient pain at tumor sites, transient autoimmune disorders

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)
Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Busulfan. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

MetroNIDAZOLE: May increase the serum concentration of Busulfan. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol due to GI irritation.

Food: No clear or firm data on the effect of food on busulfan bioavailability.

Herb/Nutraceutical: Avoid St John's wort (may decrease busulfan levels).

Monitoring ParametersCBC with differential and platelet count, liver function tests (evaluate transaminases, alkaline phosphatase, and bilirubin daily for at least 28 days post transplant)
Nursing: Physical Assessment/MonitoringIdentify any history of seizures, recent myelosuppressive therapy or radiation treatment, and pregnancy status prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, anything that may increase or decrease levels/effects of busulfan). Dosing should be based on adjusted ideal body weight (refer to individual protocols). BMT: Phenytoin or clonazepam may be ordered prophylactically during and for at least 48 hours following completion of busulfan to reduce risk of seizures if patient is predisposed to seizures. Assess results of laboratory tests (CBC with differential, platelet count, LFTs) and adverse pulmonary (pulmonary fibrosis or toxicity; may be delayed 4 months to 10 years) or hematologic effects (pancytopenia, leukopenia, thrombocytopenia, anemia, and bone marrow suppression) during therapy and for several months following therapy. Teach patient proper use (oral), possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsCBC with differential and platelet count, liver function (evaluate transaminases, alkaline phosphatase, and bilirubin daily for at least 28 days post transplant)
Patient EducationDo not take any new prescription, OTC medications, or herbal products during therapy unless approved by prescriber. Take

oral medication as directed. Maintain adequate nutrition (small, frequent meals) and hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid excess alcohol and acidic or spicy foods (may increase gastrointestinal irritation). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations unless approved by prescriber). May cause dizziness, insomnia, or confusion (use caution when driving or engaging in hazardous tasks until response to drug is known); mouth sores (brush teeth with soft toothbrush or cotton swab); loss of hair or darkening of skin color (reversible when medication is discontinued); nausea, vomiting, or loss of appetite (small, frequent meals, chewing gum, or sucking hard candy may help); constipation (increased exercise, fruit, fluids, or fiber may help); diarrhea (consult prescriber if severe or persistent); amenorrhea; sterility; or skin rash. Report palpitations or chest pain, excessive weight gain of >5 pounds; CNS changes (anxiety, confusion, depression); unusual cough or difficulty breathing; numbness or tingling of extremities; unusual bruising or bleeding; pain or changes in urination; or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Consult physician for instruction on appropriate barrier contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Busulfex®: 6 mg/mL (10 mL) [contains N,N-dimethylacetamide (DMA)]

Tablet:

Myleran®: 2 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Myleran)

2 mg (60): $173.76

Mechanism of ActionBusulfan is an alkylating agent which reacts with the N-7 position of guanosine and interferes with DNA replication and transcription of RNA. Busulfan has a more marked effect on myeloid cells than on lymphoid cells and is also very toxic to hematopoietic stem cells. Busulfan exhibits little immunosuppressive activity. Interferes with the normal function of DNA by alkylation and cross-linking the strands of DNA.

Pharmacodynamics/Kinetics

Duration: 28 days

Absorption: Rapid and complete

Distribution: V_d: ~1 L/kg; into CSF and saliva with levels similar to plasma

Protein binding: 32% to plasma proteins and 47% to red blood cells

Metabolism: Extensively hepatic (may increase with multiple doses); glutathione conjugation followed by oxidation

Half-life elimination: After first dose: 3.4 hours; After last dose: 2.3 hours

Time to peak, serum: Oral: Within 4 hours; I.V.: Within 5 minutes

Excretion: Urine (10% to 50% as metabolites) within 24 hours (<2% as unchanged drug)

Related Information

- Hematopoietic Stem Cell Transplantation
- Management of Nausea and Vomiting
- Safe Handling of Hazardous Drugs

Pharmacotherapy Pearls**Oncology Comment:** Low-dose monotherapy with oral busulfan for the palliative treatment of CML is no longer common. Treatment with imatinib or hematopoietic stem cell transplant (HSCT) are considered the primary treatments for CML (NCCN v1.2008).

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), mucositis/stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause severe pancytopenia; use caution with clozapine and carbamazepine

Oncology: Bone Marrow CommentsPhenytoin or clonazepam should be administered prophylactically during and for at least 48 hours following completion of busulfan. Risk of seizures is increased in patients with sickle cell disease. Increased risk of VOD when busulfan AUC >3000 µmol(min)/L (mean AUC, 2012 µmol(min)/L). Increased risk of failure to engraft for allogeneic BMT patients when AUC is <900 µmol (min)/L. To facilitate ingestion of high doses, multiple tablets may be inserted into gelatin capsules. Ursodiol 9-12 mg/kg/day may reduce the risk of hepatotoxicity.

Index TermsNSC-750

Butabarbital

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Butabarbital may be confused with butalbital

Pronunciation(byoo ta BAR bi tal)

U.S. Brand NamesButisol Sodium®

Pharmacologic CategoryBarbiturate

Use: Labeled IndicationsSedative; hypnotic

Dosing: Adults

Anxiety (sedative): Oral: 15-30 mg 3-4 times/day

Insomnia (hypnotic): Oral: 50-100 mg at bedtime. When used for insomnia, treatment should be limited since barbiturates lose effectiveness for sleep induction and maintenance after 2 weeks.

Preoperative sedation: Oral: 50-100 mg 1-$1^{1}/_{2}$ hours before surgery

Dosing: ElderlyRefer to adult dosing. Use with caution; reduce dose if use is needed.

Dosing: PediatricPreoperative sedation: Oral: 2-6 mg/kg/dose; maximum: 100 mg

Dosing: Renal ImpairmentReduce dose if use is needed.

Dosing: Hepatic ImpairmentReduce dose if use is needed.

RestrictionsC-III

ContraindicationsHypersensitivity to barbiturates or any component of the formulation; porphyria

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypersensitivity reactions: Postmarketing studies have indicated that the use of hypnotic/sedative agents for sleep has been associated with hypersensitivity reactions including anaphylaxis as well as angioedema.
- Paradoxical responses: May cause paradoxical responses, including agitation and hyperactivity, particularly with pain, and in pediatric patients.
- Sleep-related activities: An increased risk for hazardous sleep-related activities such as sleep-driving; cooking and eating food, and making phone calls while asleep have also been noted. Discontinue treatment in patients who report a sleep-driving episode.

Disease-related concerns:

- Depression: Use with caution in patients with depression or suicidal tendencies.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease; may cause respiratory depression.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly. Closely monitor elderly or debilitated patients for impaired cognitive or motor performance.
- Pediatrics: Use with caution in children.

Dosage form specific issues:

- Tartrazine: Some products may contain tartrazine.

Other warnings/precautions:

- Appropriate use: Symptomatic treatment of insomnia should be initiated only after careful evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric and/or medical illness. A worsening of insomnia or the emergence of new abnormalities of thought or behavior may represent unrecognized psychiatric or medical illness and requires immediate and careful evaluation.

- Withdrawal: Abrupt cessation may precipitate withdrawal, including status epilepticus in epileptic patients.

Geriatric ConsiderationsElderly may react to barbiturates with marked excitement, depression, and confusion.
Pregnancy Risk FactorD
Pregnancy ConsiderationsBarbiturates cross the placenta and can be found in fetal tissues. Acute withdrawal symptoms may occur in the neonate following *in utero* exposure near term. Withdrawal symptoms may include seizures and hyperirritabilility and may be delayed for up to 14 days after birth.
LactationEnters breast milk/use with caution
Adverse Reactions

1% to 3%: Central nervous system: Somnolence

<1%: Abnormal thinking, agitation, anxiety, apnea, ataxia, bradycardia, confusion, constipation, depression, dizziness, hallucination, hyperkinesias, hypotension, hypoventilation, insomnia, nausea, nervousness, nightmares, psychiatric disturbance, syncope, vomiting

Frequency not defined, postmarketing, and/or case reports: Agranulocytosis, anaphylaxis, angioedema, complex sleep-related activities, dependence, exfoliative dermatitis, fever, headache, hypersensitivity reactions, liver damage, megaloblastic anemia, rash, respiratory depression, Stevens-Johnson syndrome, thrombocytopenia, thrombophlebitis

Drug Interactions

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

Griseofulvin: Barbiturates may decrease the absorption of Griseofulvin. *Risk D: Consider therapy modification*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Voriconazole: Barbiturates may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Rate of absorption is increased if given as solution on an empty stomach.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersCBC, renal and hepatic function with prolonged therapy

Reference RangeSerum plasma: Habitual/therapeutic: 1-15 mg/L; toxic: 10-20 mg/L; lethal 30 mg/L

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance. Evaluate periodically for need for continued use. Be alert to possibility of anaphylaxis any time during therapy. After long-term use, taper dosage slowly when discontinuing. For inpatient use, institute safety measures, monitor effectiveness and adverse reactions. For outpatient use, monitor effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC, renal and hepatic function with prolonged therapy

Patient EducationUse exactly as directed; do not increase dose or frequency or discontinue this medicine without consulting prescriber. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol or other prescription or OTC medications (especially, pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution driving or engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help). Report skin rash or irritation; CNS changes (confusion, depression, increased sedation, excitation, headache, insomnia, or nightmares); respiratory difficulty or shortness of breath; unusual swelling, especially on face and neck; difficulty swallowing or feeling of tightness in throat; unusual weakness or unusual bleeding in mouth, urine, or stool; or other unanticipated adverse effects. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Elixir, as sodium:

Butisol Sodium®: 30 mg/5 mL (480 mL) [contains alcohol 7%, propylene glycol, sodium benzoate, and tartrazine]

Tablet, as sodium:

Butisol Sodium®: 30 mg [contains tartrazine], 50 mg [contains tartrazine]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Elixir (Butisol Sodium)

30 mg/5 mL (140): $71.68

Tablets (Butisol Sodium)

30 mg (30): $52.42

50 mg (30): $68.68

Mechanism of ActionInterferes with transmission of impulses from the thalamus to the cortex of the brain resulting in an imbalance in central inhibitory and facilitatory mechanisms

Pharmacodynamics/Kinetics

Onset of action: 45-60 minutes

Duration: 6-8 hours

Absorption: Rapid

Metabolism: Hepatic

Half-life elimination: ~100 hours

Excretion: Urine (as metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common

Mental Health: Effects on Psychiatric TreatmentRare reports of agranulocytosis; use caution with clozapine and carbamazepine; enzyme induction effects of barbiturates may decrease effects of psychotropics; CNS depressant effects of psychotropics may be enhanced by barbiturates

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep. Barbiturates are generally not utilized as first-line agents to manage anxiety or insomnia due to abuse potential and potential for drug interactions and adverse effects.

Medication Safety Issues

Sound-alike/look-alike issues:

Fioricet® may be confused with Fiorinal®, Florinef®, Lorcet®, Percocet®

Phrenilin® may be confused with Phenergan®, Trinalin®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(byoo TAL bi tal, a seet a MIN oh fen, KAF een, & KOE deen)
U.S. Brand NamesFioricet® with Codeine; Phrenilin® with Caffeine and Codeine
Pharmacologic CategoryAnalgesic Combination (Opioid); Barbiturate
Use: Labeled IndicationsRelief of symptoms of complex tension (muscle contraction) headache
Dosing: AdultsOral: Adults: 1-2 capsules every 4 hours. Total daily dosage should not exceed 6 capsules.
Dosing: ElderlyRefer to adult dosing.
Dosing: Hepatic ImpairmentUse with caution. Limited, low-dose therapy usually well tolerated in hepatic disease/cirrhosis. However, cases of hepatotoxicity at daily acetaminophen dosages <4 g/day have been reported. Avoid chronic use in hepatic impairment.
StorageStore below 30°C (86°F).
RestrictionsC-III
ContraindicationsHypersensitivity to butalbital, codeine, caffeine, acetaminophen, or any component of the formulation; porphyria
Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity
- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hepatotoxicity: May cause severe hepatic toxicity on acute overdose; in addition, chronic daily dosing in adults has resulted in liver damage in some patients.
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene-derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.
- G6PD deficiency: Use with caution in patients with known G6PD deficiency.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Renal impairment: Use with caution in patients with severe renal impairment.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

- CYP2D6 “ultra-rapid metabolizers”: Use caution in patients with two or more copies of the variant CYP2D6*2 allele; may have extensive conversion from codeine to morphine and thus increased opioid-mediated effects.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Caffeine: May cause CNS and cardiovascular stimulation, as well as GI irritation in high doses. Use with caution in patients with a history of peptic ulcer or GERD; avoid in patients with symptomatic cardiac arrhythmias.

- Dosage limit: Limit acetaminophen to <4 g/day.

Geriatric ConsiderationsElderly may react to barbiturates with marked excitement, depression, and confusion.

Pregnancy Risk FactorC (per manufacturer)

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Refer to the acetaminophen, caffeine, and codeine monographs for additional information. Butalbital crosses the placenta; may cause withdrawal seizures when taken during pregnancy.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsRefer to individual agents. Information specific to butalbital is not available. Discontinuation of breast-feeding or discontinuation of the drug should be considered.

Adverse ReactionsFrequency not defined.

Cardiovascular: Syncope, tachycardia

Central nervous system: Agitation, depression, dizziness, drowsiness, euphoria, excitement, fatigue, fever, headache, high energy, intoxicated feeling, lightheadedness, mental confusion, sedation, seizure, sluggishness

Dermatologic: Hyperhidrosis, pruritus

Endocrine & metabolic: Hot flashes

Gastrointestinal: Abdominal pain, constipation, dysphagia, flatulence, heartburn, nausea, vomiting, xerostomia

Neuromuscular & skeletal: Leg pain, muscle fatigue, numbness, paresthesia, shaky feeling

Ocular: Heavy eyelids

Otic: Earache, tinnitus

Renal: Diuresis

Respiratory: Dyspnea, nasal congestion

Miscellaneous: Allergic reaction

Note: Potential reactions associated with components of Fioricet® with Codeine include agranulocytosis, cardiac stimulation, dependence, erythema multiforme, hyperglycemia, irritability, nephrotoxicity, rash, thrombocytopenia, toxic epidermal necrolysis, tremor

Metabolism/Transport Effects

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Caffeine: **Substrate** of CYP1A2 (major), 2C9 (minor), 2D6 (minor), 2E1 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 3A4 (moderate)

Codeine: **Substrate** of CYP2D6 (major), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic

doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Griseofulvin: Barbiturates may decrease the absorption of Griseofulvin. *Risk D: Consider therapy modification*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Quinolone Antibiotics: May decrease the metabolism of Caffeine. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Ofloxacin; Sparfloxacin; Trovafloxacin. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Regadenoson: Caffeine may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Voriconazole: Barbiturates may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Test InteractionsAcetaminophen may produce false-positive tests for urinary 5-hydroxyindoleacetic acid; codeine may increase serum amylase levels
Monitoring ParametersHepatic and renal function tests (in patients with impairment)
Nursing: Physical Assessment/MonitoringSee individual agents for Acetaminophen, Caffeine, and Codeine.
Monitoring: Lab TestsHepatic and renal function tests (in patients with impairment)
Patient EducationSee individual agents for Acetaminophen, Caffeine, and Codeine.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: Butalbital 50 mg, acetaminophen 325 mg, caffeine 40 mg, and codeine phosphate 30 mg

Fioricet® with Codeine: Butalbital 50 mg, acetaminophen 325 mg, caffeine 40 mg, and codeine phosphate 30 mg

Phrenilin® with Caffeine and Codeine: Butalbital 50 mg, acetaminophen 325 mg, caffeine 40 mg, and codeine phosphate 30 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Capsules (Butalbital-APAP-Caff-Cod)

50-325-40-30 mg (30): $44.99

Capsules (Fioricet/Codeine)

50-325-40-30 mg (30): $94.58

Mechanism of ActionCombination product for the treatment of tension headache. Contains codeine (narcotic analgesic), butalbital (barbiturate), caffeine (CNS stimulant), and acetaminophen (nonopiate, nonsalicylate analgesic).

Related Information

- Acetaminophen
- Caffeine
- Codeine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause confusion, disorientation, nervousness, hallucinations, euphoria, agitation, irritability, depression, or drowsiness

Mental Health: Effects on Psychiatric TreatmentMay cause severe hepatic toxicity in overdose, use caution in patients with alcoholic liver disease. May cause agranulocytosis, use caution with clozapine and carbamazepine. May cause thrombocytopenia, use caution with valproate.

Index TermsAcetaminophen, Caffeine, Codeine, and Butalbital; Caffeine, Acetaminophen, Butalbital, and Codeine; Codeine, Acetaminophen, Butalbital, and Caffeine

Sound-alike/look-alike issues:

Fioricet® may be confused with Fiorinal®, Lorcet®

Repan® may be confused with Riopan®

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(byoo TAL bi tal, a seet a MIN oh fen, & KAF een)

U.S. Brand NamesAnolor 300; Dolgic® LQ; Dolgic® Plus; Esgic-Plus™; Esgic®; Fioricet®; Medigesic®; Repan®; Zebutal™

Pharmacologic CategoryBarbiturate

Use: Labeled IndicationsRelief of the symptomatic complex of tension or muscle contraction headache

Dosing: AdultsTension or muscle contraction headache: Oral: 1-2 tablets or capsules (or 15-30 mL solution) every 4 hours; not to exceed 6 tablets or capsules (or 180 mL solution) daily

Dosing: ElderlyNot recommended for use in the elderly.

Dosing: Renal ImpairmentDosage should be reduced.

Dosing: Hepatic ImpairmentDosage should be reduced.

StorageStore at room temperature below 30°C (86°F). Protect from moisture.

ContraindicationsHypersensitivity to butalbital, acetaminophen, caffeine, or any component of the formulation; porphyria

Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity
- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Hepatotoxicity: May cause severe hepatic toxicity on acute overdose; in addition, chronic daily dosing in adults has resulted in liver damage in some patients.

Disease-related concerns:

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.

- G6PD deficiency: Use with caution in patients with known G6PD deficiency.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Renal impairment: Use with caution in patients with severe renal impairment.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Caffeine: May cause CNS and cardiovascular stimulation, as well as GI irritation in high doses. Use with caution in patients with a history of peptic ulcer or GERD; avoid in patients with symptomatic cardiac arrhythmias.

- Dosage limit: Limit acetaminophen to <4 g/day.

Geriatric ConsiderationsElderly may react to barbiturates with marked excitement, depression, and confusion.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. The FDA pregnancy classification for most other barbiturates is Category D. Withdrawal seizures were reported in an infant 2 days after birth following maternal use of a butalbital product during the last 2 months of pregnancy; butalbital levels were measured in the infants serum. In general, barbiturates cross the placenta and distribute in fetal tissue. Teratogenic effects have been reported with 1st trimester exposure. Exposure during the third trimester may lead to symptoms of acute withdrawal following delivery; symptoms may be delayed up to 14 days. Refer to individual agents for specific information related to acetaminophen and caffeine.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsSpecific data is not available for butalbital. Barbiturates, caffeine, and acetaminophen are excreted in breast milk. The manufacturer recommends discontinuing this medication or discontinuing nursing.

Adverse Reactions**Note:** Specific percentages not reported.

Frequently observed:

Central nervous system: Dizziness, drowsiness, lightheadedness, sedation

Gastrointestinal: Abdominal pain, nausea, vomiting

Respiratory: Dyspnea

Miscellaneous: Intoxicated feeling

Infrequently observed:

Cardiovascular: Tachycardia

Central nervous system: Agitation, confusion, depression, euphoria, excitement, faintness, fever, headache, seizure

Dermatologic: Hyperhidrosis, pruritus

Endocrine & metabolic: Hot spells

Gastrointestinal: Constipation, dysphagia, heartburn, flatulence, xerostomia

Neuromuscular & skeletal: Leg pain, muscle fatigue, numbness, paresthesia

Ocular: Heavy eyelids

Otic: Earache, tinnitus

Renal: Diuresis

Respiratory: Nasal congestion

Miscellaneous: Allergic reaction, high energy, shaky feeling, sluggishness

Metabolism/Transport Effects

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Caffeine: **Substrate** of CYP1A2 (major), 2C9 (minor), 2D6 (minor), 2E1 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 3A4 (moderate)

Drug Interactions

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Griseofulvin: Barbiturates may decrease the absorption of Griseofulvin. *Risk D: Consider therapy modification*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Quinolone Antibiotics: May decrease the metabolism of Caffeine. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Ofloxacin; Sparfloxacin; Trovafloxacin. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Regadenoson: Caffeine may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Voriconazole: Barbiturates may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Test InteractionsAcetaminophen may produce false-positive tests for urinary 5-hydroxyindoleacetic acid.
Nursing: Physical Assessment/MonitoringSee individual agents for Acetaminophen and Caffeine.
Patient EducationSee individual agents for Acetaminophen and Caffeine.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Anolor 300, Esgic®, Medigesic®: Butalbital 50 mg, acetaminophen 325 mg, and caffeine 40 mg

Dolgic® Plus: Butalbital 50 mg, acetaminophen 750 mg, and caffeine 40 mg

Esgic-Plus™, Zebutal™: Butalbital 50 mg, acetaminophen 500 mg, and caffeine 40 mg

Solution:

Dolgic® LQ: Butalbital 50 mg, acetaminophen 325 mg, and caffeine 40 mg per 15 mL (480 mL) [contains alcohol 7%; tropical fruit punch flavor]

Tablet: Butalbital 50 mg, acetaminophen 325 mg, and caffeine 40 mg; butalbital 50 mg, acetaminophen 500 mg, and caffeine 40 mg

Esgic®, Fioricet®, Repan®: Butalbital 50 mg, acetaminophen 325 mg, and caffeine 40 mg

Esgic-Plus™: Butalbital 50 mg, acetaminophen 500 mg, and caffeine 40 mg

Generic AvailableYes: Excludes solution
Pricing: U.S. (www.drugstore.com)

Mechanism of Action

Butalbital is a short- to intermediate-acting barbiturate. Barbiturates depress the sensory cortex, decrease motor activity, alter cerebellar function, and produce drowsiness, sedation, hypnosis, and dose-dependent respiratory depression.

Acetaminophen inhibits the synthesis of prostaglandins in the central nervous system and peripherally blocks pain impulse generation; produces antipyresis from inhibition of hypothalamic heat-regulating center

Caffeine increases levels of 3'5' cyclic AMP by inhibiting phosphodiesterase; CNS stimulant which increases medullary respiratory center sensitivity to carbon dioxide, stimulates central inspiratory drive, and improves skeletal muscle contraction (diaphragmatic contractility)

Pharmacodynamics/KineticsAlso see Acetaminophen and Caffeine.

Absorption: Butalbital: Well absorbed

Protein binding: Butalbital: 45%

Half-life elimination: Butalbital: 35 hours

Excretion: Butalbital: Urine (59% to 88% as unchanged drug and metabolites)

Related Information

- Acetaminophen
- Caffeine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause depression, nervousness, insomnia, and nightmares; rare reports of hallucinations

Mental Health: Effects on Psychiatric TreatmentRare reports of agranulocytosis; use caution with clozapine and carbamazepine; CNS depressant effects of psychotropics may be enhance by barbiturates; enzyme induction effects of barbiturates may decrease effects of psychotropics

Medication Safety Issues

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(byoo TAL bi tal & a seet a MIN oh fen)

U.S. Brand NamesBupap; Cephadyn; Phrenilin®; Phrenilin® Forte; Promacet; Sedapap®

Pharmacologic CategoryAnalgesic, Miscellaneous; Barbiturate

Use: Labeled IndicationsRelief of the symptomatic complex of tension or muscle contraction headache

Dosing: Adults**Tension or muscle contraction headache:** Oral: One tablet/capsule every 4 hours as needed (maximum dose: 6 tablets/day)

Phrenilin®: 1-2 tablets every 4 hours as needed (maximum 6 tablets in 24 hours)

Dosing: ElderlyRefer to adult dosing. Use with caution.

Dosing: Renal ImpairmentMild-to-moderate: Should decrease dose; in severe impairment, use with caution.

Dosing: Hepatic ImpairmentMild-to-moderate: Should decrease dose; in severe impairment, use with caution.

StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light.

ContraindicationsHypersensitivity to butalbital, acetaminophen, or any component of the formulation; porphyria

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hepatotoxicity: May cause severe hepatic toxicity on acute overdose; in addition, chronic daily dosing in adults has resulted in liver damage in some patients.

Disease-related concerns:

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.
- G6PD deficiency: Use with caution in patients with known G6PD deficiency.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Renal impairment: Use with caution in patients with severe renal impairment.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.
- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Dosage limit: Limit acetaminophen to <4 g/day.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. The FDA pregnancy classification for most other barbiturates is Category D. Withdrawal seizures were reported in an infant 2 days after birth following maternal use of a butalbital product during the last 2 months of pregnancy; butalbital levels were measured in the infant's serum. In general, barbiturates cross the placenta and distribute in fetal tissue. Teratogenic effects have been reported with first trimester exposure. Exposure during the third trimester may lead to symptoms of acute withdrawal following delivery; symptoms may be delayed up to 14 days. Refer to Acetaminophen monograph for information specific to acetaminophen.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsSpecific data is not available for butalbital. Barbiturates and acetaminophen are excreted in breast milk. The manufacturer recommends discontinuing this medication or discontinue nursing.

Adverse Reactions

Frequently observed:

Central nervous system: Dizziness, drowsiness, lightheadedness, sedation

Gastrointestinal: Abdominal pain, nausea, vomiting

Respiratory: Dyspnea

Miscellaneous: Intoxicated feeling

Infrequently observed:

Cardiovascular: Tachycardia

Central nervous system: Agitation, confusion, depression, euphoria, excitement, faintness, fever, headache, seizure

Dermatologic: Hyperhidrosis, pruritus

Endocrine & metabolic: Hot spells

Gastrointestinal: Constipation, dysphagia, heartburn, flatulence, xerostomia

Neuromuscular & skeletal: Leg pain, muscle fatigue, numbness, paresthesia

Ocular: Heavy eyelids

Otic: Earache, tinnitus

Renal: Diuresis

Respiratory: Nasal congestion

Miscellaneous: Allergic reaction, high energy, shaky feeling, sluggishness

Postmarketing and/or case reports (limited to important or life-threatening): Toxic epidermal necrolysis, erythema multiforme

Metabolism/Transport Effects

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Butalbital: See Phenobarbital monograph

Drug Interactions

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

Griseofulvin: Barbiturates may decrease the absorption of Griseofulvin. *Risk D: Consider therapy modification*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Voriconazole: Barbiturates may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Test InteractionsAcetaminophen may produce false-positive tests for urinary 5-hydroxyindoleacetic acid.
Nursing: Physical Assessment/MonitoringSee individual agent for Acetaminophen.
Patient EducationSee individual agent for Acetaminophen.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Medication Safety Issues

Sound-alike/look-alike issues:

Fiorinal® may be confused with Fioricet®, Florical®, Florinef®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(byoo TAL bi tal, AS pir in, KAF een, & KOE deen)

U.S. Brand NamesAscomp® with Codeine; Fiorinal® with Codeine

Canadian Brand NamesFiorinal®-C 1/2; Fiorinal®-C 1/4; Tecnal C 1/2; Tecnal C 1/4

Pharmacologic CategoryAnalgesic Combination (Opioid); Barbiturate

Use: Labeled IndicationsRelief of symptoms of complex tension (muscle contraction) headache

Dosing: AdultsTension headache: Oral: 1-2 capsules every 4 hours as needed (maximum: 6 capsules/day)

Dosing: ElderlyUse with caution; however, barbiturates (butalbital) are generally not recommended in the elderly.

StorageStore below 25°C (77°F). Protect from moisture.

RestrictionsC-III

ContraindicationsHypersensitivity to butalbital, codeine, aspirin, caffeine, or any component of the formulation; opium derivatives; hemorrhagic diathesis (eg, hemophilia, hypoprothrombinemia, von Willebrand disease, the thrombocytopenias, thrombasthenia, and other ill-defined hereditary platelet dysfunctions, severe vitamin K deficiency, and severe liver damage); nasal polyp syndrome, angioedema, and bronchospastic reactivity to aspirin or other NSAIDs; peptic ulcer or other serious GI lesions; porphyria

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity
- Salicylate Allergy/Sensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene-derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).
- Salicylate sensitivity: Patients with sensitivity to tartrazine dyes, nasal polyps, and asthma may have an increased risk of salicylate sensitivity.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Bleeding disorders: Use with caution in patients with platelet and bleeding disorders.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Gastrointestinal disease: Use with caution in patients with erosive gastritis or peptic ulcer disease.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Renal impairment: Use with caution in patients with severe renal impairment.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Anticoagulant therapy: Use with caution in patients on anticoagulant therapy.
- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- CYP2D6 "ultra-rapid metabolizers": Use caution in patients with two or more copies of the variant CYP2D6*2 allele; may have extensive conversion from codeine to morphine and thus increased opioid-mediated effects.
- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.
- Pediatrics: Children and teenagers who have or are recovering from chickenpox or flu-like symptoms should not use this product. Changes in behavior (along with nausea and vomiting) may be an early sign of Reye's syndrome; patients should be instructed to contact their healthcare provider if these occur.

Other warnings/precautions:

- Caffeine: May cause CNS and cardiovascular stimulation, as well as GI irritation in high doses. Use with caution in patients with a history of peptic ulcer or GERD; avoid in patients with symptomatic cardiac arrhythmias.

Geriatric ConsiderationsElderly may react to barbiturates with marked excitement, depression, and confusion.

Pregnancy Risk FactorC (per manufacturer)

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination. Refer to the individual monographs for Aspirin, Caffeine, and Codeine for additional information. Butalbital crosses the placenta; may cause withdrawal seizures when taken during pregnancy.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsRefer to individual agents. Information specific to butalbital is not available. Discontinuation of breast-feeding or discontinuation of the drug should be considered.

Adverse Reactions

1% to 10%:

Central nervous system: Dizziness/lightheadedness (3%), drowsiness (2%), intoxicated feeling (1%)

Gastrointestinal: Abdominal pain/nausea (4%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Agitation, allergic reaction, anaphylactic shock, anorexia, chest pain, cholangiocarcinoma, depression, disorientation, diuresis, dysphagia, dysuria, edema, epistaxis, erythema multiforme, esophagitis, exfoliative dermatitis, fainting, gastroenteritis, GI spasm, hallucinations, hives, hypotension, nervousness, neuropathy, numbness, palpitations, psychosis, pyloric ulcer, rash, renal impairment, slurred speech, syncope, tachycardia, tinnitus, toxic epidermal necrolysis, unconsciousness, vertigo, vomiting

Note: Potential reactions associated with components of Fiorinal® with Codeine include acute airway obstruction, anemia, bleeding time prolonged, cardiac stimulation, dependence, hemolytic anemia, hepatitis, hyperglycemia, irritability, nephrotoxicity, occult blood loss, peptic ulcer, pruritus, renal toxicity (high doses, prolonged therapy) thrombocytopenia, tremor, urate excretion impaired

Metabolism/Transport Effects

Aspirin: **Substrate** of CYP2C9 (minor)

Caffeine: **Substrate** of CYP1A2 (major), 2C9 (minor), 2D6 (minor), 2E1 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 3A4 (moderate)

Codeine: **Substrate** of CYP2D6 (major), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Griseofulvin: Barbiturates may decrease the absorption of Griseofulvin. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Quinolone Antibiotics: May decrease the metabolism of Caffeine. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Ofloxacin; Sparfloxacin; Trovafloxacin. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Regadenoson: Caffeine may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131

Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Voriconazole: Barbiturates may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Test InteractionsAspirin may interfere with amylase (S), fasting blood glucose (S), cholesterol (S), protein (S), glutamic-oxaloacetic transaminases (SGOT) (S), uric acid (S, U), prothrombin time (S), bleeding time (S), glucose, 5-hydroxy-indoleacetic acid (U), Gerhardt ketone (U), vanillylmandelic acid (U), diacetic acid (U), and spectrophotometric detection of barbiturates; codeine may increase amylase levels (S)

Monitoring ParametersSerial hepatic and renal function tests (in patients with impairment)

Nursing: Physical Assessment/MonitoringSee individual agents for Aspirin, Caffeine, and Codeine.

Monitoring: Lab TestsSerial hepatic and renal function tests (in patients with impairment)

Patient EducationSee individual agents for Aspirin, Caffeine, and Codeine.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: Butalbital 50 mg, aspirin 325 mg, caffeine 40 mg, and codeine phosphate 30 mg

Ascomp® with Codeine, Fiorinal® with Codeine: Butalbital 50 mg, aspirin 325 mg, caffeine 40 mg, and codeine phosphate 30 mg [may contain benzyl alcohol]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Butalbital-ASA-Caff-Codeine)

50-325-40-30 mg (30): $45.99

Capsules (Fiorinal/Codeine #3)

50-325-40-30 mg (30): $101.03

Mechanism of ActionButalbital is a short-to-intermediate acting barbiturate; aspirin inhibits prostaglandin synthesis and has analgesic, antipyretic and anti-inflammatory actions; caffeine is a CNS stimulant; codeine is a narcotic analgesic and antitussive which produced generalized CNS depression. The combination product is for the treatment of tension headache, however, the role of each component in the relief of symptoms is not completely understood.

Pharmacodynamics/KineticsSee individual agents. Bioavailability of the combination is identical to their bioavailability when codeine is administered separately from butalbital, aspirin, and caffeine.

Related Information

- Aspirin
- Caffeine
- Codeine

Dental Health Professional ConsiderationsThere is no scientific evidence to warrant discontinuance of aspirin prior to dental surgery. Patients taking one aspirin tablet daily as an antithrombotic and who require dental surgery should be given special consideration in consultation with the physician before removal of the aspirin relative to prevention of postoperative bleeding.

The Food and Drug Administration (FDA), has issued a letter updating information and considerations regarding the use of ibuprofen (400 mg doses) in patients who are taking low dose aspirin (81 mg, immediate release; not enteric coated) for cardioprotection and stroke prevention. Ibuprofen, at these doses, may interfere with aspirin’s antiplatelet effect depending upon when it is administered. Patients initiated on aspirin first (for ~1 week) then ibuprofen (400 mg 3 times/day for 10 days) seem to maintain aspirin’s platelet effect (Cryer B, 2005). Ibuprofen has the greatest impact on aspirin if administered less than 8 hours before aspirin (Catella-Lawson F, 2001).

Patients may require counseling about the appropriate timing of ibuprofen dosing in relationship to aspirin therapy. With occasional use of ibuprofen, a clinically-significant interaction with aspirin in unlikely. To avoid interference during chronic dosing, a single dose of ibuprofen should be taken 30-120 minutes after aspirin ingestion or at least 8 hours should elapse after ibuprofen dosing before giving aspirin (FDA, 2006; Catella-Lawson F, 2001).

The clinical implications of the interaction are unclear. There have not been any clinical endpoint studies conducted at this time. Avoidance of this interaction is potentially important because aspirin’s vascular protection could be decreased or negated.

Other nonselective NSAIDs may have potential for a similar interaction with aspirin. Such has been described with naproxen (Capone ML, 2005). Acetaminophen does not appear to interfere with the antiplatelet effect of aspirin. Other clinical scenarios (use of smaller ibuprofen doses, other aspirin products, other doses of aspirin) have not been evaluated.

Additional information is available at: http://www.fda.gov/cder/drug/infopage/aspirin/default.htm

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Aspirin: As with all drugs which may affect hemostasis, bleeding is associated with aspirin. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables including dosage, concurrent use of multiple agents which alter hemostasis, and patient susceptibility. Many adverse effects of aspirin are dose related, and are rare at low dosages. Other serious reactions are idiosyncratic, related to allergy or individual sensitivity (see Dental Comment).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause depression, nervousness, insomnia, and nightmares; rare reports of hallucinations

Mental Health: Effects on Psychiatric TreatmentRare reports of agranulocytosis; use caution with clozapine and carbamazepine; CNS depressant effects of psychotropics may be enhance by barbiturates; enzyme induction effects of barbiturates may decrease effects of psychotropics

Index TermsAspirin, Caffeine, Codeine, and Butalbital; Butalbital Compound and Codeine; Codeine and Butalbital Compound; Codeine, Butalbital, Aspirin, and Caffeine

Canadian Brand NamesFiorinal®

Pharmacologic CategoryBarbiturate

Use: Labeled IndicationsRelief of the symptomatic complex of tension or muscle contraction headache

Dosing: AdultsTension or muscle contraction headache: Oral: 1-2 tablets or capsules every 4 hours; not to exceed 6 tablets or capsules/day

Dosing: ElderlyNot recommended for use in the elderly.

Dosing: Renal ImpairmentDosage should be reduced.

Dosing: Hepatic ImpairmentDosage should be reduced.

StorageStore below 25°C (77°F).

RestrictionsC-III

ContraindicationsHypersensitivity to butalbital or any component of the formulation; porphyria; pregnancy (prolonged use or high doses at term)

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity
- Salicylate Allergy/Sensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Salicylate sensitivity: Patients with sensitivity to tartrazine dyes, nasal polyps, and asthma may have an increased risk of salicylate sensitivity.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with platelet and bleeding disorders.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Gastrointestinal disease: Use with caution in patients with erosive gastritis or peptic ulcer disease.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Renal impairment: Use with caution in patients with severe renal impairment.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

Concurrent drug therapy issues:

- Anticoagulant therapy: Use with caution in patients on anticoagulant therapy.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Children and teenagers who have or are recovering from chickenpox or flu-like symptoms should not use this product. Changes in behavior (along with nausea and vomiting) may be an early sign of Reye's syndrome; patients should be instructed to contact their healthcare provider if these occur.

Other warnings/precautions:

- Caffeine: May cause CNS and cardiovascular stimulation, as well as GI irritation in high doses. Use with caution in patients with a history of peptic ulcer or GERD; avoid in patients with symptomatic cardiac arrhythmias.

Geriatric ConsiderationsElderly may react to barbiturates with marked excitement, depression, and confusion.
Pregnancy Risk FactorC/D (prolonged use or high doses at term)
LactationEnters breast milk/use caution due to aspirin content
Adverse Reactions

>10%:

Central nervous system: Dizziness, lightheadedness, drowsiness, “hangover” effect

Gastrointestinal: Heartburn, stomach pain, dyspepsia, epigastric discomfort, nausea

1% to 10%:

Central nervous system: Confusion, mental depression, unusual excitement, nervousness, faint feeling, headache, insomnia, nightmares, fatigue

Dermatologic: Skin rash

Gastrointestinal: Constipation, vomiting, gastrointestinal ulceration

Hematologic: Hemolytic anemia

Neuromuscular & skeletal: Weakness

Respiratory: Troubled breathing

Miscellaneous: Anaphylactic shock

Metabolism/Transport Effects

Aspirin: **Substrate** of CYP2C9 (minor)

Caffeine: **Substrate** of CYP1A2 (major), 2C9 (minor), 2D6 (minor), 2E1 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 3A4 (moderate)

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Griseofulvin: Barbiturates may decrease the absorption of Griseofulvin. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Quinolone Antibiotics: May decrease the metabolism of Caffeine. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Ofloxacin; Sparfloxacin; Trovafloxacin. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Regadenoson: Caffeine may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Voriconazole: Barbiturates may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Ibuprofen, at these doses, may interfere with aspirin's antiplatelet effect depending upon when it is administered. Patients initiated on aspirin first (for ~1 week) then ibuprofen (400 mg 3 times/day for 10 days) seem to maintain aspirin's platelet effect (Cryer B, 2005). Ibuprofen has the greatest impact on aspirin if administered less than 8 hours before aspirin (Catella-Lawson F, 2001).

Patients may require counseling about the appropriate timing of ibuprofen dosing in relationship to aspirin therapy. With occasional use of ibuprofen, a clinically-significant interaction with aspirin in unlikely. To avoid interference during chronic dosing, a single dose of ibuprofen should be taken 30-120 minutes after aspirin ingestion or at least 8 hours should elapse after ibuprofen dosing before giving aspirin (FDA, 2006; Catella-Lawson F, 2001).

The clinical implications of the interaction are unclear. There have not been any clinical endpoint studies conducted at this time. Avoidance of this interaction is potentially important because aspirin's vascular protection could be decreased or negated.

Other nonselective NSAIDs may have potential for a similar interaction with aspirin. Such has been described with naproxen (Capone ML, 2005). Acetaminophen does not appear to interfere with the antiplatelet effect of aspirin. Other clinical scenarios (use of smaller ibuprofen doses, other aspirin products, other doses of aspirin) have not been evaluated.

Additional information is available at: http://www.fda.gov/cder/drug/infopage/aspirin/default.htm

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Aspirin: As with all drugs which may affect hemostasis, bleeding is associated with aspirin. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables including dosage, concurrent use of multiple agents which alter hemostasis, and patient susceptibility. Many adverse effects of aspirin are dose related, and are rare at low dosages. Other serious reactions are idiosyncratic, related to allergy or individual sensitivity (see Dental Comment).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Drowsiness is common; may cause depression, nervousness, insomnia, and nightmares; rare reports of hallucinations

Mental Health: Effects on Psychiatric Treatment Rare reports of agranulocytosis; use caution with clozapine and carbamazepine; CNS depressant effects of psychotropics may be enhance by barbiturates; enzyme induction effects of barbiturates may decrease effects of psychotropics

Index Terms Aspirin, Caffeine, and Butalbital; Butalbital Compound

Medication Safety Issues

Sound-alike/look-alike issues:

Lotrimin may be confused with Lotrisone®, Otrivin®

Pronunciation(byoo TEN a feen)

U.S. Brand NamesLotrimin® Ultra™ [OTC]; Mentax®

Pharmacologic CategoryAntifungal Agent, Topical

Use: Labeled IndicationsTopical treatment of tinea pedis (athlete's foot), tinea cruris (jock itch), tinea corporis (ringworm), and tinea versicolor

Dosing: Adults

Tinea corporis, tinea cruris (Lotrimin® Ultra™): Apply once daily for 2 weeks to affected area and surrounding skin

Tinea versicolor (Mentax®): Apply once daily for 2 weeks to affected area and surrounding skin

Tinea pedis (Lotrimin® Ultra™): Apply to affected skin between and around the toes, twice daily for 1 week, or once daily for 4 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren >12 years: Refer to adult dosing.

Administration: TopicalApply to clean, dry skin. Avoid occlusive dressings.

StorageStore at 5°C to 30°C (41°F to 86°F).

ContraindicationsHypersensitivity to butenafine or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Allylamine antifungal hypersensitivity: Use caution in patients sensitive to allylamine antifungals (eg naftifine, terbinafine); cross sensitivity to butenafine may exist.
- Irritation: Discontinue if sensitivity or irritation occurs

Special populations:

- Immunocompromised patients: Has not been studied in immunocompromised patients.
- Pediatrics: Safety and efficacy have not been established in children <12 years of age

Other warnings/precautions:

- Appropriate use: For topical use only; avoid contact with eyes, mouth, nose, or other mucous membranes.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions>1%: Dermatologic: Burning, contact dermatitis, erythema, irritation, pruritus, stinging

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersCulture and KOH exam, clinical signs of tinea pedis

Monitoring: Lab TestsCulture and KOH exam

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, as hydrochloride:

Lotrimin® Ultra™: 1% (12 g, 24 g) [contains benzyl alcohol and sodium benzoate]

Mentax®: 1% (15 g, 30 g) [contains benzyl alcohol and sodium benzoate]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Cream (Mentax)

1% (15): $45.99

Mechanism of ActionButenafine exerts fungicidal activity against dermatophytes (eg trichophyton, epidermophyton) by blocking squalene epoxidation, resulting in inhibition of ergosterol synthesis and subsequent weakening of fungal cell membranes.

Pharmacodynamics/Kinetics

Absorption: Minimal systemic

Metabolism: Hepatic via hydroxylation

Half-life elimination: Biphasic: Alpha: 35 hours; Beta: >150 hours

Time to peak, serum: 6-15 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsButenafine Hydrochloride

Butoconazole

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(byoo toe KOE na zole)
U.S. Brand NamesGynazole-1®
Canadian Brand NamesFemstat® One; Gynazole-1®
Pharmacologic CategoryAntifungal Agent, Vaginal
Use: Labeled IndicationsLocal treatment of vulvovaginal candidiasis
Dosing: AdultsVulvovaginal candidiasis: Intravaginal: *Gynazole-1®:* Insert 1 applicatorful (~5 g) intravaginally as a single dose; treatment may need to be extended for up to 6 days in pregnant women (use in pregnancy during 2nd or 3rd trimester only)
Dosing: ElderlyRefer to adult dosing.
StorageStore at 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to butoconazole or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Irritation: If irritation or sensitization occurs, discontinue use.

Special populations:

- Pediatrics: Safety and efficacy have not been established in females <12 years of age.

Dosage form specific issues:

- Petrolatum-based: Contains mineral oil which may weaken latex or rubber products (condoms, vaginal contraceptive diaphragms); do not use these products within 72 hours of treatment.

- OTC product: Not for use in women with a first-time vaginal yeast infection.

Other warnings/precautions:

- HIV infection consideration: HIV infection should be considered in sexually-active women with difficult to eradicate recurrent vaginal yeast infections.

Pregnancy Risk FactorC (use only in 2nd or 3rd trimester)
Pregnancy ConsiderationsNo adequate and well-controlled studies have been conducted in pregnant women. However, butoconazole has been used during pregnancy. Use should be limited to the 2nd or 3rd trimesters only.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Gastrointestinal: Abdominal pain or cramping

Genitourinary: Pelvic pain; vulvar/vaginal burning, itching, soreness, and swelling

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, vaginal, as nitrate:

Gynazole-1®: 2% (5 g) [prefilled applicator]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Cream (Gynazole-1)

2% (5.8): $68.94

Mechanism of ActionIncreases cell membrane permeability in susceptible fungi (*Candida*)
Pharmacodynamics/Kinetics

Absorption: 2%

Metabolism: Not reported

Time to peak: 12-24 hours

Related Information

- Treatment of Sexually-Transmitted Infections

Pharmacotherapy PearlsGynazole-1®: This product is delivered in a base allowing the active ingredient to remain vaginally for 4 days. It is associated with less leakage and can therefore be applied at any time during the day or night (per product information, Gynazole-1®).

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Stadol® may be confused with Haldol®, sotalol

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(byoo TOR fa nole)

U.S. Brand NamesStadol® [DSC]

Canadian Brand NamesApo-Butorphanol®; PMS-Butorphanol

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled Indications

Parenteral: Management of moderate-to-severe pain; preoperative medication; supplement to balanced anesthesia; management of pain during labor

Nasal spray: Management of moderate-to-severe pain, including migraine headache pain

Dosing: Adults **Note:** These are guidelines and do not represent the maximum doses that may be required in all patients. Doses should be titrated to pain relief/prevention. Butorphanol has an analgesic ceiling.

Acute pain (moderate to severe):

I.M.: Initial: 2 mg, may repeat every 3-4 hours as needed; usual range: 1-4 mg every 3-4 hours as needed

I.V.: Initial: 1 mg, may repeat every 3-4 hours as needed; usual range: 0.5-2 mg every 3-4 hours as needed

Intranasal (spray) (includes use for migraine headache pain): Initial: 1 spray (~1 mg per spray) in 1 nostril; if adequate pain relief is not achieved within 60-90 minutes, an additional 1 spray in 1 nostril may be given; may repeat initial dose sequence in 3-4 hours after the last dose as needed

Alternatively, an initial dose of 2 mg (1 spray in each nostril) may be used in patients who will be able to remain recumbent (in the event drowsiness or dizziness occurs); additional 2 mg doses should not be given for 3-4 hours

Note: In some clinical trials, an initial dose of 2 mg (as 2 doses 1 hour apart or 2 mg initially - 1 spray in each nostril) has been used, followed by 1 mg in 1 hour; side effects were greater at these dosages

Migraine: *Nasal spray:* Refer to “moderate to severe pain” indication

Preoperative medication: *I.M.:* 2 mg 60-90 minutes before surgery

Supplement to balanced anesthesia: *I.V.:* 2 mg shortly before induction and/or an incremental dose of 0.5-1 mg (up to 0.06 mg/kg), depending on previously administered sedative, analgesic, and hypnotic medications

Pain during labor (fetus >37 weeks gestation and no signs of fetal distress):

I.M., I.V.: 1-2 mg; may repeat in 4 hours

Note: Alternative analgesia should be used for pain associated with delivery or if delivery is anticipated within 4 hours

Dosing: Elderly

I.M., I.V.: Initial dosage should generally be $^{1}/_{2}$ of the recommended dose; repeated dosing must be based on initial response rather than fixed intervals, but generally should be at least 6 hours apart

Nasal spray: Initial dose should not exceed 1 mg; a second dose may be given after 90-120 minutes

Dosing: Renal Impairment

I.M., I.V.: Initial dosage should generally be $^{1}/_{2}$ of the recommended dose; repeated dosing must be based on initial response rather than fixed intervals, but generally should be at least 6 hours apart

Nasal spray: Initial dose should not exceed 1 mg; a second dose may be given after 90-120 minutes

Dosing: Hepatic Impairment

I.M., I.V.: Initial dosage should generally be $^1/_2$ of the recommended dose; repeated dosing must be based on initial response rather than fixed intervals, but generally should be at least 6 hours apart

Nasal spray: Initial dose should not exceed 1 mg; a second dose may be given after 90-120 minutes

Calculations

- Opioid Agonist Conversion

Administration: I.V. DetailpH: 3.0-5.5
Administration: InhalationSee Dosing.
Administration: OtherIntranasal: Consider avoiding simultaneous intranasal migraine sprays; may want to separate by at least 30 minutes
StorageStore at room temperature; protect from freezing.
Compatibility

Y-site administration: Compatible: Allopurinol, amifostine, aztreonam, cefepime, cisatracurium, cladribine, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide, filgrastim, fludarabine, gatifloxacin, gemcitabine, granisetron, labetalol, linezolid, melphalan, paclitaxel, piperacillin/tazobactam, propofol, remifentanil, sargramostim, teniposide, thiotepa, vinorelbine. **Incompatible:** Amphotericin B cholesteryl sulfate complex, midazolam.

Compatibility in syringe: Compatible: Atropine, chlorpromazine, cimetidine, diphenhydramine, droperidol, fentanyl, hydroxyzine, meperidine, methotrimeprazine, metoclopramide, midazolam, morphine, pentazocine, perphenazine, prochlorperazine, promethazine, scopolamine, thiethylperazine. **Incompatible:** Dimenhydrinate, pentobarbital.

RestrictionsC-IV
ContraindicationsHypersensitivity to butorphanol or any component of the formulation; avoid use in opiate-dependent patients who have not been detoxified, may precipitate opiate withdrawal; pregnancy (prolonged use or high doses at term)
Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.

- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.

- CNS depression/coma: Use with caution in patients with CNS depression or coma.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Obesity: Use with caution in patients who are morbidly obese.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

- Sumatriptan nasal spray: Concurrent use of sumatriptan nasal spray and butorphanol nasal spray may increase risk of transient high blood pressure.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precaution:

- Abuse/misuse/diversion: Healthcare provider should be alert to problems of abuse, misuse, and diversion.

- Optimal regimen: An opioid-containing analgesic regimen should be tailored to each patient's needs and based upon the type of pain being treated (acute versus chronic), the route of administration, degree of tolerance for opioids (naive versus chronic user), age, weight, and medical condition. The optimal analgesic dose varies widely among patients; doses should be titrated to pain relief/prevention.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsAdjust dose for renal function in the elderly.
Pregnancy Risk FactorC/D (prolonged use or high doses at term)
LactationEnters breast milk/use caution (AAP rates “compatible”)
Adverse Reactions

>10%:

Central nervous system: Drowsiness (43%), dizziness (19%), insomnia (Stadol® NS)

Gastrointestinal: Nausea/vomiting (13%)

Respiratory: Nasal congestion (Stadol® NS)

1% to 10%:

Cardiovascular: Vasodilation, palpitation

Central nervous system: Lightheadedness, headache, lethargy, anxiety, confusion, euphoria, somnolence

Dermatologic: Pruritus

Gastrointestinal: Anorexia, constipation, xerostomia, stomach pain, unpleasant aftertaste

Neuromuscular & skeletal: Tremor, paresthesia, weakness

Ocular: Blurred vision

Otic: Ear pain, tinnitus

Respiratory: Bronchitis, cough, dyspnea, epistaxis, nasal irritation, pharyngitis, rhinitis, sinus congestion, sinusitis, upper respiratory infection

Miscellaneous: Diaphoresis increased

<1%: Bradycardia or tachycardia, hypertension, paradoxical CNS stimulation, hallucinations, mental depression, malaise, restlessness, nightmares, CNS depression, urination decreased, rash, stomach cramps, painful urination, blurred vision, tinnitus, weakness, dyspnea, respiratory depression, dependence with prolonged use, difficulty speaking (transient), hypotension, syncope, agitation, dysphoria, hostility, vertigo, withdrawal symptoms, hives.

<1% (Stadol® NS): Edema, chest pain, hypertension, tachycardia, convulsions, delusions, depressions, apnea, shallow breathing

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol (may increase CNS depression). Watch for sedation.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersPain relief, respiratory and mental status, blood pressure
Reference Range0.7-1.5 ng/mL
Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for possible additive or adverse interactions. Monitor for effectiveness of pain relief, signs of overdose, vital signs, and adverse effects at beginning of therapy and at regular intervals with long-term use. For inpatients, implement safety measures. May cause physical and/or psychological dependence. Assess knowledge/teach patient appropriate use (if self-administered), adverse reactions to report, and appropriate interventions to reduce side effects.
Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. May cause dizziness, drowsiness, confusion, or blurred vision (use caution when driving, climbing stairs, or changing position - rising from sitting or lying to standing, or when engaging in tasks requiring alertness until response to drug is known); nausea or vomiting, or loss of appetite (frequent mouth care, small frequent meals, sucking lozenges, or chewing gum may help). Report unresolved nausea or vomiting; respiratory difficulty or shortness of breath; restlessness, insomnia, euphoria, or nightmares; excessive sedation or unusual weakness; facial flushing, rapid heartbeat, or palpitations; urinary difficulty; or vision changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. If you are breast-feeding, take dose immediately after breast-feeding or 3-4 hours prior to next feeding.

Nasal administration: Do not use more frequently than prescribed. Blow nose prior to administering. Follow directions on package insert. Insert nozzle of applicator gently into one nostril and exhale. With next breath, squeeze applicator once firmly and quickly once as you breath in. If adequate relief from headache is not achieved within 60-90 minutes, an additional 1 spray may be given. May be repeated in 3-4 hours following last dose, as needed. **Alternatively:** Two sprays may be given - one spray in each nostril, if you are able to remain lying down (in the event of drowsiness or dizziness). Additional doses should not be taken for 3-4 hours. Avoid using simultaneously with intranasal migraine sprays. Separate by at least 30 minutes.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as tartrate [preservative free]: 1 mg/mL (1 mL); 2 mg/mL (1 mL, 2 mL)

Injection, solution, as tartrate [with preservative]: 2 mg/mL (10 mL)

Solution, intranasal, as tartrate [spray]: 10 mg/mL (2.5 mL) [14-15 doses]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Solution (Butorphanol Tartrate)

10 mg/mL (2.5): $56.99

Mechanism of ActionMixed narcotic agonist-antagonist with central analgesic actions; binds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; produces generalized CNS depression
Pharmacodynamics/Kinetics

Onset of action: I.M.: 5-10 minutes; I.V.: <10 minutes; Nasal: Within 15 minutes

Peak effect: I.M.: 0.5-1 hour; I.V.: 4-5 minutes

Duration: I.M., I.V.: 3-4 hours; Nasal: 4-5 hours

Absorption: Rapid and well absorbed

Protein binding: 80%

Metabolism: Hepatic

Bioavailability: Nasal: 60% to 70%

Half-life elimination: 2.5-4 hours

Excretion: Primarily urine

Related Information

- Narcotic / Opioid Analgesics

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and unpleasant aftertaste.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDrowsiness is common; may rarely produce CNS stimulation or depression, hallucinations, and confusion
Mental Health: Effects on Psychiatric TreatmentContraindicated in opiate dependent patients; may precipitate opiate withdrawal; concurrent use with psychotropic may produce additive sedation

Anesthesia and Critical Care Concerns/Other Considerations Butorphanol is a mixed agonist-antagonist opiate; may precipitate withdrawal in narcotic-dependent patients. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms. This agent can potentially cause hallucinations.

C1 Inhibitor (Human)

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation

(cee won in HIB i ter HYU man)

U.S. Brand NamesCinryze™

Pharmacologic Category[Blood Product Derivative]()

Use: Labeled IndicationsRoutine prophylaxis against angioedema attacks in patients with hereditary angioedema (HAE) or inherited C1 inhibitor deficiency

Use: Unlabeled/InvestigationalTreatment of acute or severe angioedema attacks (eg, laryngeal swelling) in patients with HAE

Dosing: Adults**Routine prophylaxis against HAE attacks:** I.V.: 1000 units every 3-4 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Children: Dosage not established.

Adolescents: Refer to adult dosing.

Administration: I.V.Administer at 1 mL/minute (over 10 minutes). Allow to warm to room temperature prior to administration and use within 3 hours of reconstitution.

StorageStore under refrigeration at 2°C to 25°C (36°F to 77°F); do not freeze. **Protect from light** prior to reconstitution.

ReconstitutionProduct should come to room temperature before combining with diluent (sterile water for injection). Reconstitute each vial with 5 mL of sterile water for injection using the double-ended transfer needle; do not use product if there is no vacuum in the vial. Use 2 reconstituted vials to make single 1000 unit dose. After combining with diluent, gently swirl vial to completely dissolve powder. Reconstituted product should be clear and colorless or slightly blue; do not use if turbid or discolored. The provided filter needle should be used to withdraw the reconstituted product. Remove filter needle and attach reconstituted solution to infusion set or appropriate needle for infusion and use within 3 hours of reconstitution.

ContraindicationsHistory of anaphylactic or life-threatening hypersensitivity reactions to human C1 inhibitor or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity: Severe hypersensitivity reactions (eg, urticaria, hives, wheezing, hypotension, anaphylaxis) may occur rarely during or after administration. Signs/symptoms of hypersensitivity reactions may be similar to the attacks associated with hereditary angioedema, therefore, consideration should be given to treatment methods. In the event of acute hypersensitivity reactions to C1 inhibitor therapy, treatment should be discontinued and epinephrine should be available.

- Thrombotic events: Consider potential risk of thrombosis with use; thrombotic events have been reported when used off-label at doses higher than recommended in product labeling.

Special Populations:

- Pediatrics: Safety and efficacy have been established in adolescents and adults. Only a small number of children were included in clinical trials.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

Geriatric ConsiderationsInsufficient geriatric patients have been studied to determine any difference in response from younger patients.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. There are no adequate and well-controlled studies in pregnant women. Information related to use during pregnancy is limited. Pregnancy may increase the incidence of attacks in patients with HAE.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsReactions reported below were observed in a study involving 24 patients.

≥5%:

Central nervous system: Headache

Dermatologic: Pruritus, rash

Neuromuscular & skeletal: Back pain, extremity pain

Respiratory: Bronchitis, sinusitis, upper respiratory tract infection

Miscellaneous: Limb injury

Drug InteractionsThere are no known significant interactions.

Dosage Forms

Injection, powder for reconstitution:

Cinryze™: 500 units [contains sucrose 21 mg/mL]

Generic AvailableNo

Mechanism of ActionC1 inhibitor, one of the serine proteinase inhibitors found in human blood, plays a role in regulating the complement and intrinsic coagulation (contact system) pathway, and is also involved in the fibrinolytic and kinin pathways. C1 inhibitor therapy in patients with C1 inhibitor deficiency, such as HAE, is believed to suppress contact system activation via inactivation of plasma kallikrein and factor XIIa, thus preventing bradykinin production. Unregulated bradykinin production is thought to contribute to the increased vascular permeability and angioedema observed in HAE.

Pharmacodynamics/Kinetics

Onset of action: Increased plasma C1 inhibitor levels observed ~1 hour or less

Half-life elimination: 56 hours (range: 11-108 hours)

Time to peak: ~4 hours

Pharmacotherapy Pearls1 unit of Cinryze™ corresponds to C1 inhibitor present in 1 mL of normal fresh plasma

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsC1 Esterase Inhibitor; C1-INH; C1-Inhibitor; C1INHRP; Human C1 Inhibitor

Cabergoline

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ca BER goe leen)
U.S. Brand NamesDostinex® [DSC]
Canadian Brand NamesCO Cabergoline; Dostinex®
Pharmacologic CategoryErgot Derivative
Use: Labeled IndicationsTreatment of hyperprolactinemic disorders, either idiopathic or due to pituitary adenomas
Dosing: AdultsHyperprolactinemic disorders: Oral: Initial dose: 0.25 mg twice weekly; the dose may be increased by 0.25 mg twice weekly up to a maximum of 1 mg twice weekly according to the patient's serum prolactin level. Dosage increases should not occur more rapidly than every 4 weeks. Once a normal serum prolactin level is maintained for 6 months, the dose may be discontinued and prolactin levels monitored to determine if cabergoline is still required. The durability of efficacy beyond 24 months of therapy has not been established.
Dosing: ElderlyRefer to adult dosing. No dosage recommendations suggested; however, start at the low end of the dosage range.
Dosing: Renal ImpairmentNo adjustment required.
Dosing: Hepatic Impairment

Mild-to-moderate dysfunction (Child-Pugh Class B): No adjustment required

Severe dysfunction (Child-Pugh Class C): Use caution; significant increase in AUC

StorageStore at 20°C to 25°C (68°F to 77°F).
ContraindicationsHypersensitivity to ergot derivatives; uncontrolled hypertension; history of pulmonary, pericardial, cardiac valvular or retroperitoneal fibrotic disorders
Allergy Considerations

- Ergot Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac valvular fibrosis: Cardiac valvular disease (mitral, aortic, tricuspid regurgitation) has been associated with cabergoline (a potent 5-HT_{2B} agonist). Incidence may be higher for daily doses >2 mg and for duration of use ≥6 months. Following diagnosis of fibrosis/valvulopathy, discontinuation of cabergoline may result in improvement in condition.

- Orthostatic hypotension: Initial doses >1 mg may cause orthostatic hypotension. Concurrent use with antihypertensives may increase risk.

- Pleural/retroperitoneal fibrosis: Rare cases of pleural effusion, pulmonary/retroperitoneal fibrosis have been reported with prolonged daily use.

- Psychiatric disorders: Pathological gambling, increased libido, and hypersexuality have been reported with use; generally reversible with dose reduction or discontinuation of treatment.

Disease-related concerns:

- Hepatic impairment: Use with caution and carefully monitor patients with hepatic impairment; extensively metabolized by the liver.

- Pregnancy-induced hypertension: Should not be used in patients with pregnancy-induced hypertension unless benefit outweighs potential risk.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Not indicated for the inhibition or suppression of physiologic lactation; other dopamine agonists are associated with cases of hypertension, stroke, and seizures.

- Monitoring: In all patients, prolactin concentrations should be monitored monthly until normalized.

Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in most animal studies when administered in maternally nontoxic doses. Treatment of hyperprolactinemia may restore fertility in a previously infertile woman. Because information concerning the use of cabergoline in pregnancy is limited, bromocriptine is generally recommended to treat hyperprolactinemia in women who wish to conceive. Based on preliminary data, cabergoline has not been shown to increase the risk of congenital malformations or miscarriages when used early in pregnancy (treatment was generally stopped once pregnancy was diagnosed). Not recommended for use in patients with pregnancy-induced hypertension unless benefit outweighs potential risk.
LactationExcretion in breast milk unknown/not recommended

Breast-Feeding Considerations Interferes with lactation and should not be given to women postpartum who are breast-feeding or who are planning to breast-feed. Not indicated for the suppression of physiologic lactation.

Adverse Reactions

>10%:

- Central nervous system: Headache (26%), dizziness (15% to 17%)
- Gastrointestinal: Nausea (27% to 29%)

1% to 10%:

- Cardiovascular: Postural hypotension (4%), hypotension (1%), dependent edema (1%), edema (peripheral 1%), palpitation (1%), syncope (1%)
- Central nervous system: Fatigue (5% to 7%), vertigo (1% to 4%), depression (3%), somnolence (2% to 5%), nervousness (1% to 2%), anxiety (1%), insomnia (1%), concentration impaired (1%), malaise (1%)
- Dermatologic: Acne (1%), pruritus (1%)
- Endocrine: Hot flashes (1% to 3%), breast pain (1% to 2%), dysmenorrhea (1%)
- Gastrointestinal: Constipation (7% to 10%), abdominal pain (5%), dyspepsia (2% to 5%), vomiting (2% to 4%), xerostomia (2%), diarrhea (2%), flatulence (2%), anorexia (1%), throat irritation (1%), toothache (1%)
- Neuromuscular & skeletal: Weakness (6% to 9%), pain (2%), paresthesia (1% to 2%), arthralgia (1%)
- Ocular: Abnormal vision (1%), periorbital edema (1%)
- Respiratory: Rhinitis (1%)
- Miscellaneous: Flu-like syndrome (1%)

<1%: Confusion (in patients with Parkinson's disease [PD]), constrictive pericarditis (in PD patients), duodenal ulcer (in PD patients), dyskinesia (in PD patients), epistaxis, facial edema, gastric ulcer (in PD patients), hallucinations (in PD patients), heart failure (in PD patients), libido increased, pleural effusion (in PD patients), pulmonary fibrosis (in PD patients), weight gain/loss

Postmarketing and/or case reports: Aggression, alopecia, cardiac fibrosis, hypersexuality, pathological gambling, psychosis, valvulopathy

Drug Interactions

Efavirenz: May enhance the adverse/toxic effect of Ergot Derivatives. Specifically, the risk for peripheral vasospasm and ischemia may be increased. *Risk X: Avoid combination*

Posaconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: Ergot Derivatives may enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Ergot Derivatives. This may cause serotonin syndrome. *Risk X: Avoid combination*

Voriconazole: May increase the serum concentration of Ergot Derivatives. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions Herb/Nutraceutical: Avoid products that enhance serotonin activity (includes SAMe [S-adenosylmethionine] and St John's wort); may increase the risk of serotonin syndrome.

Monitoring Parameters Blood pressure (both sitting/supine and standing); serum prolactin level, echocardiogram with long-term use (>6 months)

Monitoring: Lab Tests Serum prolactin level

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: 0.5 mg

- Dostinex®: 0.5 mg [DSC]

Generic Available Yes

Pricing: U.S. (www.drugstore.com)

Tablets (Cabergoline)

- 0.5 mg (8): $265.97

Mechanism of Action Cabergoline is a long acting dopamine receptor agonist with a high affinity for D_2 receptors; prolactin secretion by the anterior pituitary is predominantly under hypothalamic inhibitory control exerted through the release of dopamine. It is a potent 5-HT_{2B}-receptor agonist, which may contribute to observed fibrotic/valvulopathic events.

Pharmacodynamics/Kinetics

Distribution: Extensive, particularly to the pituitary

Protein binding: 40% to 42%

Metabolism: Extensively hepatic via hydrolysis; minimal CYP mediated metabolism

Half-life elimination: 63-69 hours

Time to peak: 2-3 hours

Excretion: Primarily feces (~60%); urine (~22%, <4% as unchanged drug)

Related Information

- Antiparkinsonian Agents

Pharmacotherapy Pearls Bromocriptine and cabergoline are the only drugs indicated for the treatment of hyperprolactinemia. In the largest comparative clinical trial, prolactin levels normalized in 77% of patients treated with cabergoline compared to 59% of patients treated with bromocriptine. In that trial, 3% of patients discontinued treatment due to adverse effects in the cabergoline group versus 12% of patients in the bromocriptine group. In addition to the improved safety and efficacy profile, cabergoline (administered twice weekly) is more convenient than bromocriptine (administered 1-3 times/day) for patients to take.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), throat irritation, and toothache.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Dizziness is common; may cause depression

Mental Health: Effects on Psychiatric Treatment Antipsychotics may decrease the therapeutic effects of cabergoline; avoid combination

Cardiovascular Considerations Valvular damage may be mediated through the serotonin receptor subtype 5-HT$_{2B}$ as proliferation of fibroblasts occurs within valve tissue when stimulated. Some experts recommend avoiding prescribing medications that are potent 5-HT$_{2B}$-receptor agonists.

Caffeine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(KAF een)
U.S. Brand NamesCafcit®; Enerjets [OTC]; No Doz® Maximum Strength [OTC]; Vivarin® [OTC]
Pharmacologic CategoryStimulant
Use: Labeled Indications

Caffeine citrate: Treatment of idiopathic apnea of prematurity

Caffeine and sodium benzoate: Treatment of acute respiratory depression (not a preferred agent)

Caffeine [OTC labeling]: Restore mental alertness or wakefulness when experiencing fatigue

Use: Unlabeled/InvestigationalCaffeine and sodium benzoate: Treatment of spinal puncture headache; CNS stimulant; diuretic; augmentation of seizure induction during electroconvulsive therapy (ECT)
Dosing: Adults

Note: Caffeine citrate should not be interchanged with the caffeine sodium benzoate formulation.

Caffeine and sodium benzoate:

Electroconvulsive therapy: I.V.: 300-2000 mg

Respiratory depression: I.M., I.V.: 250 mg as a single dose; may repeat as needed. Maximum single dose should be limited to 500 mg; maximum amount in any 24-hour period should generally be limited to 2500 mg.

Spinal puncture headache (unlabeled use):

I.V.: 500 mg in 1000 mL NS infused over 1 hour, followed by 1000 mL NS infused over 1 hour; a second course of caffeine can be given for unrelieved headache pain in 4 hours.

Oral: 300 mg as a single dose

Stimulant/diuretic (unlabeled use): I.M., I.V.: 500 mg, maximum single dose: 1 g

OTC labeling (stimulant): Oral: 100-200 mg every 3-4 hours as needed

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Note: Caffeine citrate should not be interchanged with the caffeine sodium benzoate formulation.

Caffeine citrate: Apnea of prematurity: Neonates: Oral, I.V.:

Loading dose: 10-20 mg/kg as caffeine citrate (5-10 mg/kg as caffeine base). If theophylline has been administered to the patient within the previous 3 days, a full or modified loading dose (50% to 75% of a loading dose) may be given.

Maintenance dose: 5 mg/kg/day as caffeine citrate (2.5 mg/kg/day as caffeine base) once daily starting 24 hours after the loading dose. Maintenance dose is adjusted based on patient's response and serum caffeine concentrations.

Caffeine and sodium benzoate: Stimulant:

I.M., I.V., SubQ: 8 mg/kg every 4 hours as needed

Oral: OTC labeling: Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment required.
Administration: I.M.Parenteral: **Caffeine and sodium benzoate:** May administer I.M. undiluted
Administration: I.V.Parenteral:

Caffeine citrate: Infuse loading dose over at least 30 minutes; maintenance dose may be infused over at least 10 minutes. May administer without dilution or diluted with D_5W to 10 mg caffeine citrate/mL.

Caffeine and sodium benzoate: I.V. as slow direct injection. For spinal headaches, dilute in 1000 mL NS and infuse over 1 hour. Follow with 1000 mL NS; infuse over 1 hour. May administer I.M. undiluted.

Administration: OralMay be administered without regard to feedings or meals. May administer injectable formulation (caffeine citrate) orally.
StorageStore at 20°C to 25°C (68°F to 77°F).

Caffeine citrate: Injection and oral solution contain no preservatives; injection is chemically stable for at least 24 hours at room temperature when diluted to 10 mg/mL (as caffeine citrate) with D$_5$W, D$_{50}$W, Intralipid® 20%, and Aminosyn® 8.5%; also compatible with dopamine (600 mcg/mL), calcium gluconate 10%, heparin (1 unit/mL), and fentanyl (10 mcg/mL) at room temperature for 24 hours.

CompatibilityCaffeine citrate: Stable in D$_5$W, D$_{50}$W, Intralipid® 20%, Aminosyn® 8.5%.

Compatible: Calcium gluconate 10%, dopamine (600 mcg/mL), fentanyl (10 mcg/mL), heparin (1 unit/mL).

ContraindicationsHypersensitivity to caffeine or any component of the formulation; sodium benzoate is not for use in neonates
Warnings/Precautions

Disease-related concerns:

- Anxiety: Avoid use in patients with anxiety, agitation, or tremor.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease; avoid use in patients with symptomatic cardiac arrhythmias.
- Gastrointestinal disease: Use with caution in patients with a history of peptic ulcer and/or gastroesophageal reflux.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.
- Seizure disorder: Use with caution in patients with a history of seizure disorder; may lower seizure threshold leading to new onset or breakthrough seizure activity.

Special populations:

- Neonates: Caffeine citrate should be closely monitored for the development of necrotizing enterocolitis in the neonate; caffeine serum levels should be closely monitored to optimize therapy and prevent serious toxicity. Avoid use of products containing sodium benzoate in neonates; has been associated with a potentially fatal toxicity (“gasping syndrome”) in neonates, including metabolic acidosis, respiratory distress, gasping respirations, seizures, intracranial hemorrhage, hypotension, and cardiovascular collapse. *In vitro* and animal studies have shown that benzoate also displaces bilirubin from protein-binding sites.

Dosage form specific issues:

- OTC products: Over-the-counter [OTC] products contain an amount of caffeine similar to one cup of coffee; limit the use of other caffeine-containing beverages or foods.
- Product interchangeability: **Caffeine citrate should not be interchanged with caffeine and sodium benzoate.**

Pregnancy Risk FactorC
Pregnancy ConsiderationsCaffeine crosses the placenta; serum levels in the fetus are similar to those in the mother. When large bolus doses are administered to animals, teratogenic effects have been reported. Similar doses are not probable following normal caffeine consumption and moderate consumption is not associated with congenital malformations, spontaneous abortions, preterm birth or low birth weight. According to one source, pregnant women who do not smoke or drink alcohol could consume ≤5 mg/kg of caffeine over the course of a day without reproductive risk. Another source recommends limiting caffeine intake to <150 mg/day. The half-life of caffeine is prolonged during the second and third trimesters of pregnancy.
LactationEnters breast milk/use caution (AAP rates “compatible”)
Breast-Feeding ConsiderationsIrritability and poor sleeping patterns have been reported following maternal consumption of large amounts of caffeine. Moderate intake (2-3 cups/day) is considered to be compatible with breast-feeding.
Adverse ReactionsFrequency not specified; primarily serum-concentration related.
Cardiovascular: Angina, arrhythmia (ventricular), chest pain, flushing, palpitation, sinus tachycardia, tachycardia (supraventricular), vasodilation

Central nervous system: Agitation, delirium, dizziness, hallucinations, headache, insomnia, irritability, psychosis, restlessness

Dermatologic: Urticaria

Gastrointestinal: Esophageal sphincter tone decreased, gastritis

Neuromuscular & skeletal: Fasciculations

Ocular: Intraocular pressure increased (>180 mg caffeine), miosis

Renal: Diuresis

Metabolism/Transport Effects**Substrate** of CYP1A2 (major), 2C9 (minor), 2D6 (minor), 2E1 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 3A4 (moderate)
Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Quinolone Antibiotics: May decrease the metabolism of Caffeine. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Ofloxacin; Sparfloxacin; Trovafloxacin. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Regadenoson: Caffeine may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Reference Range

Therapeutic: Apnea of prematurity: 8-20 mcg/mL

Potentially toxic: >20 mcg/mL

Toxic: >50 mcg/mL

Nursing: Physical Assessment/MonitoringAssess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Patient EducationTake as directed. Do not exceed recommended dosage. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake by prescriber. You may experience CNS stimulation, excitability, sensorium changes, flushing, dizziness, insomnia, or agitation. Report excessive excitability or nervousness, rapid heartbeat or palpitations, chest pain, or respiratory difficulty. **Pregnancy/breast-feeding precaution:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Caplet:

NoDoz® Maximum Strength, Vivarin®: 200 mg

Injection, solution, as citrate [preservative free]: 20 mg/mL (3 mL) [equivalent to 10 mg/mL caffeine base]

Cafcit®: 20 mg/mL (3 mL) [equivalent to 10 mg/mL caffeine base]

Injection, solution [with sodium benzoate]: Caffeine 125 mg/mL and sodium benzoate 125 mg/mL (2 mL); caffeine 121 mg/mL and sodium benzoate 129 mg/mL (2 mL) [DSC]

Lozenge:

Enerjets®: 75 mg [classic coffee, hazelnut cream, or mochamint flavor]

Solution, oral, as citrate [preservative free]: 20 mg/mL (3 mL) [equivalent to 10 mg/mL caffeine base]

Cafcit®: 20 mg/mL (3 mL) [equivalent to 10 mg/mL caffeine base]

Tablet: 200 mg

Vivarin®: 200 mg

Generic AvailableYes: Tablet, caffeine and sodium benzoate injection, injection, oral solution

Mechanism of ActionIncreases levels of 3'5' cyclic AMP by inhibiting phosphodiesterase; CNS stimulant which increases medullary respiratory center sensitivity to carbon dioxide, stimulates central inspiratory drive, and improves skeletal muscle contraction (diaphragmatic contractility); prevention of apnea may occur by competitive inhibition of adenosine

Pharmacodynamics/Kinetics

Distribution: V_d:

Neonates: 0.8-0.9 L/kg

Children >9 months to Adults: 0.6 L/kg

Protein binding: 17% (children) to 36% (adults)

Metabolism: Hepatic, via demethylation by CYP1A2. **Note:** In neonates, interconversion between caffeine and theophylline has been reported (caffeine levels are ~25% of measured theophylline after theophylline administration and ~3% to 8% of caffeine would be expected to be converted to theophylline)

Half-life elimination:

Neonates: 72-96 hours (range: 40-230 hours)

Children >9 months and Adults: 5 hours

Time to peak, serum: Oral: Within 30 minutes to 2 hours

Excretion:

Neonates ≤1 month: 86% excreted unchanged in urine

Infants >1 month and Adults: In urine, as metabolites

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia, nervousness, anxiety, and delirium.

Mental Health: Effects on Psychiatric TreatmentMay counteract sedative/hypnotics; may also lower seizure threshold and increase risk for epilepsy/convulsions

Anesthesia and Critical Care Concerns/Other ConsiderationsCaffeine has 40% of the bronchodilatory activity of theophylline. Lithium blood levels may increase during caffeine withdrawal. Analgesia from transcutaneous electrical nerve stimulation may be lessened with concomitant caffeine use.

Index TermsCaffeine and Sodium Benzoate; Caffeine Citrate; Sodium Benzoate and Caffeine

Calcipotriene and Betamethasone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(kal si POE try een & bay ta METH a sone)
U.S. Brand NamesTaclonex Scalp®; Taclonex®
Canadian Brand NamesDovobet®
Pharmacologic CategoryCorticosteroid, Topical; Vitamin D Analog
Use: Labeled IndicationsTreatment of psoriasis vulgaris
Use: Unlabeled/InvestigationalTreatment of corticosteroid-responsive dermatoses
Dosing: Adults

Psoriasis vulgaris: Topical:

Cream/ointment: Apply to affected area once daily for up to 4 weeks (maximum recommended dose: 100 g/week). Application to >30% of body surface area is not recommended.

Suspension: Apply to affected area of the scalp once daily for 2 weeks or until clear; may continue for up to 8 weeks (maximum recommended dose: 100 g/week)

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentSafety and efficacy have not been established with severe renal impairment.
Dosing: Hepatic ImpairmentSafety and efficacy have not been established with severe hepatic impairment.
Administration: TopicalWash hands before and after use.

Cream/ointment: Rub into affected area gently and completely. Do not apply to face, axillae, or groin.

Suspension: Shake well before use. Do not apply within 12 hours of chemical hair treatment. Do not wash hair directly after use.

StorageStore at controlled room temperature of 20°C to 2°C (68°F to 77°F); excursions permitted between 15°C to 30°C (59°F to 86°F). Do not refrigerate. Discard suspension 3 months from date opened. Keep suspension bottle in outer carton when not in use.
Contraindications

Cream, ointment: Hypersensitivity to calcipotriene, betamethasone, or any component of the formulation; disorders of calcium metabolism; erythrodermic, exfolliative, and pustular psoriasis; viral, fungal, or bacterial infection of the skin; evidence of vitamin D toxicity

Suspension: There are no contraindications listed within the FDA-approved labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.

- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.

- Hypercalcemia/hypercalciuria: May cause transient increases in serum and urinary calcium (reversible); if hypercalcemia or hypercalciuria occurs, discontinue treatment until levels return to normal.

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children; may be at higher risk of systemic side effects.

Other warnings/precautions:

- Application site: Do not use on the face, axillae, groin, or in the presence of pre-existing skin atrophy at the treatment site. Avoid exposure of suspension to the eyes; irritation may occur. Avoid excessive exposure of treated skin to sunlight (natural or artificial).

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this topical combination. There are no adequate and well-controlled studies in pregnant women. See individual agents.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsSee individual agents.

Adverse Reactions

1% to 10%: Dermatologic: Pruritus (4%), erythema (2%), irritation (1%), scaly rash (1%), folliculitis (≤1%)

<1%: Acne, eye irritation, HPA axis suppression, hypercalcemia, hypercalciuria, papular rash, psoriasis exacerbation, pustular psoriasis, pustular rash, skin atrophy, skin hyper-/hypopigmentation, telangiectasia

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop.

Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Cream, topical:

Dovobet® [CAN]: Calcipotriol 50 mcg and betamethasone 0.5 mg per gram (3 g, 30 g, 60 g, 100 g, 120 g) [not available in the U.S.]

Ointment, topical:

Taclonex®: Calcipotriene 0.005% and betamethasone dipropionate 0.064% (60 g, 100 g)

Suspension, topical:

Taclonex Scalp®: Calcipotriene 0.005% and betamethasone dipropionate 0.064% (15 g, 30 g, 60 g, 2 x 60 g)

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Ointment (Taclonex)

0.005-0.064% (60): $454.42

0.005-0.064% (100): $729.01

Mechanism of ActionCalcipotriene is a vitamin D derivative and betamethasone dipropionate ointment is a high-potency corticosteroid.

Related Information

- Betamethasone
- Calcipotriene

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsBetamethasone Dipropionate and Calcipotriene Hydrate; Calcipotriol and Betamethasone Dipropionate

Calcipotriene

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(kal si POE try een)
U.S. Brand NamesDovonex®
Canadian Brand NamesDovonex®
Pharmacologic CategoryTopical Skin Product; Vitamin D Analog
Use: Labeled IndicationsTreatment of plaque psoriasis; chronic, moderate-to-severe psoriasis of the scalp
Use: Unlabeled/InvestigationalVitiligo
Dosing: AdultsPsoriasis: Topical:

Cream: Apply a thin film to the affected skin twice daily and rub in gently and completely, for up to 8 weeks

Solution: Apply to the affected scalp twice daily and rub in gently and completely, for up to 8 weeks

Dosing: ElderlyRefer to adult dosing.
Administration: TopicalFor external use only.
Cream: Apply to affected skin; rub in gently and completely. Wash hands thoroughly before and after use.

Solution: Prior to using scalp solution, comb hair to remove debris; apply only to lesions. Rub in gently and completely. Avoid solution spreading or dripping onto forehead. Avoid contact with eyes. Wash hands thoroughly before and after use.

StorageStore at controlled room temperature of 15° to 25°C (59° to 77°F). Do not freeze. Solution should be kept away from open flame; avoid sunlight.
ContraindicationsHypersensitivity to calcipotriene or any component of the formulation; patients with demonstrated hypercalcemia or evidence of vitamin D toxicity; use on the face; patients with acute psoriatic eruptions (scalp solution)
Warnings/Precautions

Concerns related to adverse effects:

- Hypercalcemia: May cause transient increases in serum calcium (reversible); if hypercalcemia occurs, discontinue treatment until levels return to normal.
- Irritation: Discontinue use if irritation occurs.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: For external use only; not for ophthalmic, oral, or intravaginal use. Avoid or limit excessive exposure to natural or artificial sunlight, or phototherapy.

Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects have been observed in animal studies. There are no adequate or well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency may vary with site of application.

>10%: Dermatologic: Burning, itching, rash, skin irritation, stinging, tingling

1% to 10%: Dermatologic: Dermatitis, dry skin, erythema, peeling, pruritus, worsening of psoriasis

Note: Skin atrophy, hyperpigmentation, folliculitis, and hypercalcemia are potential adverse effects of calcipotriene.

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersSerum calcium
Nursing: Physical Assessment/MonitoringWhen applied to large areas of skin or for extensive periods of time, monitor for adverse skin or systemic reactions. Assess knowledge/teach patient appropriate application and use and adverse symptoms to report.
Monitoring: Lab TestsSerum calcium
Patient EducationFor external use only. Use exactly as directed; do not overuse. Before using, wash and dry area gently. Wear gloves to apply a thin film to affected area and rub in gently. If dressing is necessary, use a porous dressing. Avoid contact with eyes. Avoid exposing treated area to direct sunlight; sunburn can occur. Report increased swelling, redness, rash, itching, signs of infection, worsening of condition, or lack of healing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Cream:

Medication Safety Issues

Sound-alike/look-alike issues:

Calcitonin may be confused with calcitriol

Miacalcin® may be confused with Micatin®

Calcitonin nasal spray is administered as a single spray into **one** nostril daily, using alternate nostrils each day.

Pronunciation(kal si TOE nin)

U.S. Brand NamesFortical®; Miacalcin®

Canadian Brand NamesApo-Calcitonin®; Calcimar®; Caltine®; Miacalcin® NS; Pro-Calcitonin

Pharmacologic CategoryAntidote; Hormone

Use: Labeled IndicationsCalcitonin (salmon): Treatment of Paget's disease of bone (osteitis deformans); adjunctive therapy for hypercalcemia; treatment of osteoporosis in women >5 years postmenopause

Dosing: Adults

Paget's disease*(Miacalcin®)*: I.M., SubQ: Initial: 100 units/day; maintenance: 50 units/day or 50-100 units every 1-3 days

Hypercalcemia*(Miacalcin®)*: Initial: I.M., SubQ: 4 units/kg every 12 hours; may increase up to 8 units/kg every 12 hours to a maximum of every 6 hours

Postmenopausal osteoporosis:

Miacalcin®: I.M., SubQ: 100 units/every other day

Fortical®, Miacalcin®: Intranasal: 200 units (1 spray) in one nostril daily

Dosing: ElderlyRefer to adult dosing.

Administration: I.M.Administer injection solution I.M. or SubQ; intramuscular route is recommended over the subcutaneous route when the volume of calcitonin to be injected exceeds 2 mL.

Administration: InhalationNasal spray: Before first use, allow bottle to reach room temperature, then prime pump by releasing at least 5 sprays until full spray is produced. To administer, place nozzle into nostril with head in upright position. Alternate nostrils daily. Do not prime pump before each daily use. Discard after 30 doses.

Dietary ConsiderationsAdequate vitamin D and calcium intake is essential for preventing/treating osteoporosis. Patients with Paget's disease and hypercalcemia should follow a low calcium diet as prescribed.

Storage

Injection: Store under refrigeration at 2°C to 8°C (36°F to 46°F); protect from freezing.

Nasal: Store unopened bottle under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze.

Fortical®: After opening, store for up to 30 days at 20°C to 25°C (68°F to 77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Store in upright position.

Miacalcin®: After opening, store for up to 35 days at room temperature of 15°C to 30°C (59°F to 86°F). Store in upright position.

ReconstitutionInjection: NS has been recommended for the dilution to prepare a skin test in patients with suspected sensitivity.

ContraindicationsHypersensitivity to calcitonin salmon or any component of the formulation

Allergy Considerations

- Calcitonin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Salmon-derived products: Have epinephrine immediately available for a possible hypersensitivity reaction. A skin test should be performed prior to initiating therapy of calcitonin salmon in patients with suspected sensitivity; a detailed skin testing protocol is available from the manufacturer.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Nasal spray: Temporarily withdraw use of nasal spray if ulceration of nasal mucosa occurs. Patients >65 years of age may experience a higher incidence of nasal adverse events with calcitonin nasal spray.

Geriatric ConsiderationsStudies have shown calcitonin's effects on bone density and fracture rates are beneficial, particularly in women unable to tolerate estrogens. Calcium and vitamin D supplements should also be given. Calcitonin may also be effective in steroid-induced osteoporosis and other states associated with high bone turnover. Nasal spray may provide faster onset of analgesic effects than I.M.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDecreased birth weight was observed in animal studies. Calcitonin does not cross the placental barrier. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsHas been shown to decrease milk production in animals.

Adverse ReactionsUnless otherwise noted, frequencies reported are with nasal spray.

>10%: Respiratory: Rhinitis (12%)

1% to 10%:

Cardiovascular: Flushing (nasal spray: <1%; injection: 2% to 5%), angina (1% to 3%), hypertension (1% to 3%)

Central nervous system: Depression (1% to 3%), dizziness (1% to 3%), fatigue (1% to 3%)

Dermatologic: Erythematous rash (1% to 3%)

Gastrointestinal: Abdominal pain (1% to 3%), constipation (1% to 3%), diarrhea (1% to 3%), dyspepsia (1% to 3%), nausea (injection: 10%; nasal spray: 1% to 3%)

Genitourinary: Cystitis (1% to 3%)

Local: Injection site reactions (injection: 10%)

Neuromuscular & skeletal: Back pain (5%), arthrosis (1% to 3%), myalgia (1% to 3%), paresthesia (1% to 3%)

Ocular: Conjunctivitis (1% to 3%), lacrimation abnormality (1% to 3%)

Respiratory: Bronchospasm (1% to 3%), sinusitis (1% to 3%), upper respiratory tract infection (1% to 3%)

Miscellaneous: Flu-like syndrome (1% to 3%), infection (1% to 3%), lymphadenopathy (1% to 3%)

<1%: Agitation, allergic reactions, alopecia, anaphylaxis, anemia, anorexia, anxiety, appetite increased, arthritis, blurred vision, bronchitis, bundle branch block, cerebrovascular accident, cholelithiasis, cough, diaphoresis, dyspnea, earache, eczema, fever, flatulence, gastritis, goiter, hearing loss, hematuria, hepatitis, hyperthyroidism, insomnia, migraine, myocardial infarction, neuralgia, nocturia, palpitation, parosmia, periorbital edema, pharyngitis, pneumonia, polymyalgia rheumatica, pruritus, pyelonephritis, rash, renal calculus, skin ulceration, stiffness, tachycardia, taste perversion, thirst, thrombophlebitis, tinnitus, vertigo, vitreous floater, vomiting, weight gain, xerostomia

Oncology: VesicantNo

Oncology: Emetic PotentialModerate (30% to 60%); nausea and vomiting are generally mild

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase risk of osteoporosis).

Monitoring ParametersSerum electrolytes and calcium; alkaline phosphatase and 24-hour urine collection for hydroxyproline excretion (Paget's disease), urinalysis (urine sediment); bone mineral density

Nasal formulation: Visualization of nasal mucosa, turbinate, septum, and mucosal blood vessels)

Reference RangeTherapeutic: <19 pg/mL (SI: 19 ng/L) basal, depending on the assay

Nursing: Physical Assessment/MonitoringSkin test should be administered before initiating therapy (increased erythema or skin wheal indicates positive reaction and allergy). Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests and patient response (eg, hypocalcemic tetany, hypercalcemia) at regular intervals during therapy. Teach appropriate administration (eg, subcutaneous or I.M. injections or nasal spray), dietary requirements (low calcium diet if used for hypercalcemia), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum electrolytes and calcium, alkaline phosphatase and 24-hour urine collection for hydroxyproline excretion (Paget's disease), urinalysis (urine sediment); bone mineral density

Patient EducationDo not take any new medication during therapy unless approved by prescriber. If administered by injection, you or a significant other will be instructed on how to give the injections and dispose of syringes/needles (follow directions exactly). Keep drug vials in refrigerator; do not freeze. May cause increased warmth and flushing (this should only last about 1 hour after administration; taking drug in evening may minimize these discomforts). Report significant nasal irritation if using nasal spray. Immediately report twitching, muscle spasm, dark-colored urine, hives, significant skin rash, palpitations, or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [calcitonin-salmon]:

Miacalcin®: 200 int. units/mL (2 mL)

Solution, intranasal [spray, calcitonin-salmon]:

Fortical®: 200 int. units/0.09 mL (3.7 mL) [rDNA origin; contains benzyl alcohol; delivers 30 doses, 200 units/actuation]

Miacalcin®: 200 int. units/0.09 mL (3.7 mL) [contains benzalkonium chloride; delivers 30 doses, 200 units/actuation]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Miacalcin)

200 units/ACT (3.7): $123.32

200 units/mL (2): $55.92

Mechanism of ActionPeptide sequence similar to human calcitonin; functionally antagonizes the effects of parathyroid hormone. Directly inhibits osteoclastic bone resorption; promotes the renal excretion of calcium, phosphate, sodium, magnesium, and potassium by decreasing tubular reabsorption; increases the jejunal secretion of water, sodium, potassium, and chloride

Pharmacodynamics/Kinetics

Hypercalcemia: I.M. or SubQ:

Onset of action: ~2 hours

Duration: 6-8 hours

Absorption: Nasal: ~3% of I.M. level (range: 0.3% to 31%)

Distribution: Does not cross placenta

Half-life elimination: SubQ: 1.2 hours; Nasal: 43 minutes

Time to peak: Nasal: ~30-40 minutes

Excretion: Urine (as inactive metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression, dizziness, or fatigue. Rarely associated with agitation, anxiety, and insomnia.

Mental Health: Effects on Psychiatric TreatmentMay cause GI side effects; concomitant use with SSRIs, carbamazepine, valproic acid, and lithium may produce additive effects.

Index TermsCalcitonin (Salmon)

Medication Safety Issues

Sound-alike/look-alike issues:

Calcitriol may be confused with calcifediol, Calciferol®, calcitonin

Dosage is expressed in mcg (micrograms), **not** mg (milligrams); rare cases of acute overdose have been reported

Pronunciation(kal si TRYE ole)

U.S. Brand NamesCalcijex®; Rocaltrol®

Canadian Brand NamesCalcijex®; Rocaltrol®

Pharmacologic CategoryVitamin D Analog

Use: Labeled IndicationsManagement of hypocalcemia in patients on chronic renal dialysis; management of secondary hyperparathyroidism in patients with chronic kidney disease (CKD); management of hypocalcemia in hypoparathyroidism and pseudohypoparathyroidism

Use: Unlabeled/InvestigationalDecrease severity of psoriatic lesions in psoriatic vulgaris; vitamin D-dependent rickets

Dosing: Adults

Hypocalcemia in patients on chronic renal dialysis (manufacturer labeling):

Oral: 0.25 mcg/day or every other day (may require 0.5-1 mcg/day); increases should be made at 4- to 8-week intervals

I.V.: Initial: 1-2 mcg 3 times/week (0.02 mcg/kg) approximately every other day. Adjust dose at 2-4 week intervals; dosing range: 0.5-4 mcg 3 times/week

Hypocalcemia in hypoparathyroidism/pseudohypoparathyroidism (manufacturers labeling): Oral (evaluate dosage at 2- to 4-week intervals): Initial: 0.25 mcg/day, range: 0.5-2 mcg once daily

Secondary hyperparathyroidism associated with moderate-to-severe CKD in patients not on dialysis (manufacturer labeling): Oral: 0.25 mcg/day; may increase to 0.5 mcg/day

K/DOQI guidelines for vitamin D therapy in CKD:

CKD stage 3: Oral: 0.25 mcg/day. Treatment should only be started with serum 25(OH) D >30 ng/mL, serum iPTH >70 pg/mL, serum calcium <9.5 mg/dL and serum phosphorus <4.6 mg/dL

CKD stage 4: Oral: 0.25 mcg/day. Treatment should only be started with serum 25(OH) D >30 ng/mL, serum iPTH >110 pg/mL, serum calcium <9.5 mg/dL and serum phosphorus <4.6 mg/dL

CKD stage 5:

Peritoneal dialysis: Oral: Initial: 0.5-1 mcg 2-3 times/week or 0.25 mcg/day

Hemodialysis: **Note:** The following initial doses are based on plasma PTH and serum calcium levels for patients with serum phosphorus <5.5 mg/dL and Ca-P product <55. Adjust dose based on serum phosphate, calcium, and PTH levels. Intermittent I.V. administration may be more effective than daily oral dosing.

Plasma PTH 300-600 pg/mL and serum Ca <9.5 mg/dL: Oral, I.V.: 0.5-1.5 mcg

Plasma PTH 600-1000 pg/mL and serum Ca <9.5 mg/dL:

Oral: 1-4 mcg

I.V.: 1-3 mcg

Plasma PTH >1000 pg/mL and serum Ca <10 mg/dL:

Oral: 3-7 mcg

I.V.: 3-5 mcg

Vitamin D-dependent rickets (unlabeled use): Oral: 1 mcg once daily

Dosing: ElderlyRefer to adult dosing. No dosage recommendations, but start at the lower end of the dosage range.

Dosing: Pediatric

Hypocalcemia in hypoparathyroidism/pseudohypoparathyroidism (manufacturers labeling): Oral (evaluate dosage at 2- to 4-week intervals):

Children <1 year (unlabeled use): 0.04-0.08 mcg/kg once daily

Children 1-5 years: 0.25-0.75 mcg once daily

Children ≥6 years: Refer to adults dosing.

Secondary hyperparathyroidism associated with moderate-to-severe CKD in patients not on dialysis (manufacturer labeling): Oral:

Children <3 years: Initial dose: 0.01-0.015 mcg/kg/day

Children ≥3 years: Refer to adults dosing.

K/DOQI guidelines for vitamin D therapy in CKD:

CKD stage 2, 3: Oral:

<10 kg: 0.05 mcg every other day

10-20 kg: 0.1-0.15 mcg/day

>20 kg: 0.25 mcg/day

Note: Treatment should only be started with serum 25(OH) D >30 ng/mL, serum iPTH >70 pg/mL, serum calcium <10 mg/dL and serum phosphorus less than or equal to the age appropriate level.

CKD stage 4: Oral:

<10 kg: 0.05 mcg every other day

10-20 kg: 0.1-0.15 mcg/day

>20 kg: 0.25 mcg/day

Note: Treatment should only be started with serum 25(OH) D >30 ng/mL, serum iPTH >110 pg/mL, serum calcium <10 mg/dL and serum phosphorus less than or equal to the age appropriate level.

CKD stage 5: Oral, I.V.: **Note:** The following initial doses are based on plasma PTH and serum calcium levels for patients with serum phosphorus <5.5 mg/dL in adolescents or <6.5 in infants and children, and Ca-P product <55 in adolescents or <65 in infants and children <12 years. Adjust dose based on serum phosphate, calcium and PTH levels. Administer dose with each dialysis session (3 times/week). Intermittent I.V./oral administration is more effective than daily oral dosing.

Plasma PTH 300-500 pg/mL and serum Ca <10 mg/dL: 0.0075 mcg/kg (maximum: 0.25 mcg/day)

Plasma PTH >500-1000 pg/mL and serum Ca <10 mg/dL: 0.015 mcg/kg (maximum: 0.5 mcg/day)

Plasma PTH >1000 pg/mL and serum Ca <10.5 mg/dL: 0.025 mcg/kg (maximum: 1 mcg/day)

Vitamin D-dependent rickets (unlabeled use): Refer to adults dosing.

Dosing: Adjustment for ToxicityK/DOQI guidelines: Children and Adults: CKD stage 3 and 4:

iPTH below target: Hold calcitriol until levels rise then resume treatment at half the previous dose. If the lowest dose was being used, switch to alternate day therapy.

Corrected total calcium >9.5 mg/dL (adults) or 10.2 mg/dL (children): Hold calcitriol until serum calcium returns to <9.5 mg/dL (adults) or <9.8 mg/dL (children) then resume treatment at half the previous dose. If the lowest dose was being used, switch to alternate day therapy.

Serum phosphorus >4.6 mg/dL (adults) or greater than the age appropriate limits in children: Hold calcitriol (or add/increase dose of phosphate binder) until levels of phosphorous decrease, then resume at half the prior dose.

Dosing: Combination Regimens

Prostate cancer: Estramustine + Docetaxel + Calcitriol

Administration: I.V.May be administered as a bolus dose I.V. through the catheter at the end of hemodialysis.

Administration: I.V. DetailpH: 5.9-7.0

Administration: OralMay be administered without regard to food. Give with meals to reduce GI problems.

Dietary ConsiderationsMay be taken without regard to food. Give with meals to reduce GI problems. Adequate calcium intake should be maintained during therapy; dietary phosphorous may need to be restricted. Rocaltrol® capsules contain coconut oil; Rocaltrol® solution contains palm seed oil.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.

CompatibilityStable in D_5W, NS, sterile water for injection.

ContraindicationsHypersensitivity to calcitriol or any component of the formulation; hypercalcemia, vitamin D toxicity

Warnings/Precautions

Concerns related to adverse effects:

- Excessive vitamin D: Excessive vitamin D administration may lead to over suppression of PTH, progressive or acute hypercalcemia, hypercalciuria, hyperphosphatemia and adynamic bone disease.

Disease-related concerns:

- Malabsorption syndrome: Use with caution in patients with malabsorption syndromes; efficacy may be limited and/or response may be unpredictable.

- Renal impairment: Use of calcitriol for the treatment of secondary hyperparathyroidism associated with CKD is not recommended in patients with rapidly worsening kidney function or in noncompliant patients. Increased serum phosphate levels in patients with renal failure may lead to ectopic calcification; the use of an aluminum-containing phosphate binder is recommended along with a low phosphate diet in these patients.

Concurrent drug therapy issues:

- Calcium: Adequate dietary (supplemental) calcium is necessary for clinical response to vitamin D.

- Cardiac glycosides: Use with caution in patients taking cardiac glycosides; digitalis toxicity is potentiated by hypocalcemia.

Dosage form specific issues:

- Coconut oil: Products may contain coconut oil (capsule).

- Palm seed oil: Products may contain palm seed oil (oral solution).

- Tartrazine: Some products may contain tartrazine.

Other warnings/precautions:

- Calcium-phosphate product: Serum calcium times phosphorus must not exceed 70 mg^2/dL^2.

Geriatric ConsiderationsRecommended daily allowances (RDA) have not been developed for persons >65 years of age; vitamin D, folate, and B_{12} (cyanocobalamin) have decreased absorption with age, but the clinical significance is yet unknown. Calorie requirements decrease with age and therefore, nutrient density must be increased to ensure adequate nutrient intake, including vitamins and minerals. Therefore, the use of a daily supplement with a multiple vitamin with minerals is recommended. Elderly consume less vitamin D, absorption may be decreased, and many elderly have decreased sun exposure; therefore, elderly should receive supplementation with 800 units of vitamin D (20 mcg)/day. This is a recommendation of particular need to those with high risk for osteoporosis.

Pregnancy Risk FactorC (manufacturer); A/D (dose exceeding RDA recommendation) (expert analysis)

Pregnancy ConsiderationsTeratogenic effects have been observed in animal studies. Mild hypercalcemia has been reported in a newborn following maternal use of calcitriol during pregnancy. If calcitriol is used for the management of hypoparathyroidism in pregnancy, dose adjustments may be needed as pregnancy progresses and again following delivery. Vitamin D and calcium levels should be monitored closely and kept in the lower normal range.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsLow levels are found in breast milk (~2 pg/mL)

Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiac arrhythmia, hypertension

Central nervous system: Apathy, headache, hypothermia, psychosis, sensory disturbances, somnolence

Dermatologic: Erythema multiforme, pruritus

Endocrine & metabolic: Dehydration, growth suppression, hypercalcemia, hypercholesterolemia, hypermagnesemia, hyperphosphatemia, libido decreased, polydipsia

Gastrointestinal: Abdominal pain, anorexia, constipation, metallic taste, nausea, pancreatitis, stomach ache, vomiting, weight loss, xerostomia

Genitourinary: Nocturia, urinary tract infection

Hepatic: ALT increased, AST increased

Local: Injection site pain (mild)

Neuromuscular & skeletal: Bone pain, myalgia, dystrophy, soft tissue calcification, weakness

Ocular: Conjunctivitis, photophobia

Renal: Albuminuria, BUN increased, creatinine increased, hypercalciurianephrocalcinosis, polyuria

Respiratory: Rhinorrhea

Miscellaneous: Allergic reaction

Metabolism/Transport Effects**Induces** CYP3A4 (weak)

Drug Interactions

Bile Acid Sequestrants: May decrease the serum concentration of Calcitriol. *Risk C: Monitor therapy*

Cardiac Glycosides: Calcitriol may enhance the arrhythmogenic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Magnesium Salts: Calcitriol may increase the serum concentration of Magnesium Salts. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Thiazide Diuretics: May enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Monitoring ParametersSigns and symptoms of vitamin D intoxication; alkaline phosphatase, serum creatinine

Serum calcium and phosphorus:

CKD stage 2-4: Every month for the first 3 months, then every 3 months

CKD stage 5: Every 2 weeks for 1 month, then monthly

Serum or plasma intact PTH (iPTH):

CKD stage 3 and 4: Every 3 months for 6 months, then every 3 months

CKD stage 5: Monthly for 3 months, then every 3 months

Reference Range

CKD K/DOQI guidelines definition of stages; chronic disease is kidney damage or GFR <60 mL/minute/1.73 m^2 for ≥3 months:

Stage 2: GFR 60-89 mL/minute/1.73 m^2 (kidney damage with mild decrease GFR)

Stage 3: GFR 30-59 mL/minute/1.73 m^2 (moderate decrease GFR)

Stage 4: GFR 15-29 mL/minute/1.73 m^2 (severe decrease GFR)

Stage 5: GFR <15 mL/minute/1.73 m^2 or dialysis (kidney failure)

Target range for iPTH:

Stage 2 CKD: 35-70 pg/mL (children)

Stage 3 CKD: 35-70 pg/mL (children and adults)

Stage 4 CKD: 70-110 pg/mL (children and adults)

Stage 5 CKD: 150-300 pg/mL (adults); 200-300 pg/mL (children)

Serum phosphorus:

Stage 3 and 4 CKD: ≥2.7 to <4.6 mg/dL (adults); within age appropriate limits (children)

Stage 5 CKD: 3.5-5.5 mg/dL (children >12 years and adults); 4-6 mg/dL (children 1-12 years)

Serum calcium-phosphorus product:

Stage 3-5 CKD: <55 mg^2/dL^2 (children >12 years and adults); <65 mg^2/dL^2 (children ≤12 years)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse effects at beginning of therapy and regularly with long-term use. Assess knowledge/teach patient appropriate use, appropriate nutritional counseling, possible side effects/interventions, and adverse symptoms to report.

Monitoring: Lab TestsAlkaline phosphatase, serum creatinine

Serum calcium and phosphorus:

CKD stage 2-4: Every month for the first 3 months, then every 3 months

CKD stage 5: Every 2 weeks for 1 month, then monthly

Serum or plasma intact PTH (iPTH):

CKD stage 3 and 4: Every 3 months for 6 months, then every 3 months

CKD stage 5: Monthly for 3 months, then every 3 months

Patient EducationTake exact dose as prescribed; do not increase dose. Maintain recommended diet and calcium supplementation. Avoid taking magnesium-containing antacids. You may experience nausea, vomiting, loss of appetite, or metallic taste (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report chest pain or palpitations; acute headache; skin rash; change in vision or eye irritation; CNS changes; unusual weakness or fatigue; persistent nausea, vomiting, cramps, or diarrhea; or muscle or bone pain. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, softgel: 0.25 mcg, 0.5 mcg

Rocaltrol®: 0.25 mcg [contains coconut oil]; 0.5 mcg [contains coconut oil]

Injection, solution: 1 mcg/mL (1 mL)

Calcijex®: 1 mcg/mL (1 mL) [contains aluminum]

Solution, oral: 1 mcg/mL (15 mL)

Rocaltrol®: 1 mcg/mL (15 mL) [contains palm seed oil]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Calcitriol)

0.25 mcg (30): $34.99

0.5 mcg (30): $55.99

Capsules (Rocaltrol)

0.25 mcg (30): $44.99

0.5 mcg (30): $63.99

Mechanism of ActionCalcitriol is a potent active metabolite of vitamin D. Vitamin D promotes absorption of calcium in the intestines and retention at the kidneys thereby increasing calcium levels in the serum; decreases excessive serum phosphatase levels, parathyroid hormone levels, and decreases bone resorption; increases renal tubule phosphate resorption

Pharmacodynamics/Kinetics

Onset of action: ~2-6 hours

Duration: 3-5 days

Absorption: Oral: Rapid

Protein binding: 99.9%

Metabolism: Primarily to 1,24,25-trihydroxycholecalciferol and 1,24,25-trihydroxy ergocalciferol

Half-life elimination: Children ~27 hours; Normal adults: 5-8 hours; Hemodialysis: 16-22 hours

Time to peak, serum: Oral: 3-6 hours; Hemodialysis: 8-12 hours

Excretion: Primarily feces; urine

Related Information

- Antacid Drug Interactions

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Metallic taste and xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation or irritability

Mental Health: Effects on Psychiatric TreatmentNone reported

Index Terms1,25 Dihydroxycholecalciferol

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

PhosLo® may be confused with Phos-Flur®, ProSom™

Pronunciation(KAL see um AS e tate)
U.S. Brand NamesPhosLo®
Canadian Brand NamesPhosLo®
Pharmacologic CategoryAntidote; Calcium Salt; Phosphate Binder
Use: Labeled IndicationsControl of hyperphosphatemia in end-stage renal failure; does not promote aluminum absorption
Dosing: Adults

Dietary Reference Intake:

Adults, Male/Female:

19-50 years: 1000 mg/day

≥51 years: 1200 mg/day

Female: Pregnancy/Lactating: Same as for Adults, Male/Female

Control of hyperphosphatemia (ESRD, on dialysis): Oral: Initial: 1334 mg with each meal, can be increased gradually to bring the serum phosphate value <6 mg/dL as long as hypercalcemia does not develop (usual dose: 2001-2868 mg calcium acetate with each meal); do not give additional calcium supplements

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Dietary Reference Intake:

0-6 months: 210 mg/day

7-12 months: 270 mg/day

1-3 years: 500 mg/day

4-8 years: 800 mg/day

9-18 years: 1300 mg/day

Dosing: Renal ImpairmentRefer to adult dosing.
Administration: OralAdminister with meals.
Dietary ConsiderationsOral dosage forms must be administered with meals to be effective.
Compatibility

Compatibility when admixed: Incompatible: Carbonates, phosphates, sulfates, tartrates.

ContraindicationsHypersensitivity to any component of the formulation; hypercalcemia, renal calculi
Warnings/Precautions

Concerns related to adverse effects:

- Gastrointestinal effects: Constipation, bloating, and gas are common with calcium supplements (especially carbonate salt).

Disease-related concerns:

- Arrhythmias: Use with caution in patients who may be at risk of cardiac arrhythmias.

- Hypoparathyroid disease: Hypercalcemia and hypercalciuria are most likely to occur in hypoparathyroid patients receiving high doses of vitamin D.

Concurrent drug therapy issues:

- Digitalis: Use with caution in digitalized patients; hypercalcemia may precipitate cardiac arrhythmias.

- Minerals/other oral drugs: Calcium administration interferes with absorption of some minerals and drugs; use with caution.

Geriatric ConsiderationsConstipation and gas can be significant in the elderly, but are usually mild.

Dietary Reference Intake: Adults, ≥51 years: 1200 mg/day

Pregnancy Risk FactorC

Adverse Reactions

Mild hypercalcemia (calcium: >10.5 mg/dL to ≤12 mg/dL) may be asymptomatic or manifest itself as constipation, anorexia, nausea, and vomiting

More severe hypercalcemia (calcium: >12 mg/dL) is associated with confusion, delirium, stupor, and coma

Postmarketing and/or case reports: Pruritus, allergic reaction

Drug Interactions

Bisphosphonate Derivatives: Calcium Salts may decrease the absorption of Bisphosphonate Derivatives. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Calcium Salts may diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CefTRIAXone: Calcium Salts (Intravenous) may enhance the adverse/toxic effect of CefTRIAXone. Ceftriaxone binds to calcium forming an insoluble precipitate. *Risk X: Avoid combination*

DOBUTamine: Calcium Salts may diminish the therapeutic effect of DOBUTamine. *Risk C: Monitor therapy*

Estramustine: Calcium Salts may decrease the absorption of Estramustine. *Risk D: Consider therapy modification*

Phosphate Supplements: Calcium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Calcium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Moxifloxacin. *Risk D: Consider therapy modification*

Thiazide Diuretics: May decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Trientine: Calcium Salts may decrease the serum concentration of Trientine. Trientine may decrease the serum concentration of Calcium Salts. *Risk D: Consider therapy modification*

Monitoring ParametersSerum calcium, serum phosphate; for control of hypophosphatemia, serum calcium times phosphate should not exceed 66

Reference Range

Serum calcium: 8.4-10.2 mg/dL

Due to a poor correlation between the serum ionized calcium (free) and total serum calcium, particularly in states of low albumin or acid/base imbalances, direct measurement of ionized calcium is recommended.

In low albumin states, the corrected **total** serum calcium may be estimated by the following equation (assuming a normal albumin of 4 g/dL).

Corrected total calcium = total serum calcium + 0.8 (4.0 - measured serum albumin)

or

Corrected calcium = measured calcium - measured albumin + 4.0

Monitoring: Lab TestsSerum calcium, serum phosphate; for control of hypophosphatemia, serum calcium times phosphate should not exceed 66

Patient EducationInform prescriber of any other medications or dietary supplements you are taking. Do not take any new medication during therapy without consulting prescriber. Follow exact instructions for dosing. Take with meals. Avoid alcohol, other antacids, caffeine, or other calcium supplements unless approved by prescriber. May cause constipation (increased exercise, fluids, fiber, or fruits may help) or dry mouth (frequent mouth care, chewing gum, or sucking lozenges may help). Report severe, unresolved GI disturbances and unusual emotional lability (mood swings). **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gelcap: 667 mg

PhosLo®: 667 mg [equivalent to elemental calcium 169 mg (8.45 mEq)]

Generic AvailableYes

ManufacturerBraintree Laboratories, Inc

Pricing: U.S. (www.drugstore.com)

Capsules (PhosLo)

667 mg (200): $198.00

Mechanism of ActionCombines with dietary phosphate to form insoluble calcium phosphate which is excreted in feces

Pharmacodynamics/Kinetics

Absorption: Requires vitamin D; minimal unless chronic, high doses are given; calcium is absorbed in soluble, ionized form; solubility of calcium is increased in an acid environment

Distribution: Crosses placenta; enters breast milk

Excretion: Primarily feces (as unabsorbed calcium); urine (20%)

Pharmacotherapy Pearls Calcium acetate binds to phosphorus in the GI tract better than other calcium salts due to its lower solubility and subsequent reduced absorption and increased formation of calcium phosphate.

12.7 mEq calcium/g; 250 mg/g elemental calcium (25% elemental calcium)

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause confusion and delirium (as a consequence of hypercalcemia)

Mental Health: Effects on Psychiatric Treatment None reported

Cardiovascular Considerations Hypercalcemia is evident on ECG by shortening of the QT interval and possibly lengthening of the PR interval. Hypocalcemia causes prolongation of the QT interval. This prolongation is due to lengthening of the ST segment; the T waves remain unchanged. However, in severe hypocalcemia, T waves may be inverted. Note that only hypocalcemia and hypothermia lengthen the ST segment without altering T-wave duration. Hypocalcemia may also present clinically with skeletal muscle spasm.

Medication Safety Issues

Sound-alike/look-alike issues:

Mylanta® may be confused with Mynatal®

Pronunciation(KAL see um KAR bun ate & mag NEE zhum hye DROKS ide)

U.S. Brand NamesMi-Acid™ Double Strength [OTC]; Mylanta® Gelcaps® [OTC]; Mylanta® Supreme [OTC]; Mylanta® Ultra [OTC]; Rolaids® Extra Strength [OTC]; Rolaids® [OTC]

Pharmacologic CategoryAntacid

Use: Labeled IndicationsHyperacidity

Dosing: AdultsHyperacidity: Oral: 2-4 tablets between meals, at bedtime, or as directed by healthcare provider

Dosing: ElderlyRefer to adult dosing.

Drug Interactions

ACE Inhibitors: Antacids may decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Antacids may decrease the absorption of Allopurinol. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists: Antacids may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amphetamines: Antacids may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Antacids may decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Antacids may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): Antacids may decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Atazanavir: Antacids may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Bisacodyl: Antacids may diminish the therapeutic effect of Bisacodyl. Antacids may cause the delayed-release bisacodyl tablets to release drug prior to reaching the large intestine. Gastric irritation and/or cramps may occur. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Calcium Salts may decrease the absorption of Bisphosphonate Derivatives. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Antacids may decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Magnesium Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcitriol: May increase the serum concentration of Magnesium Salts. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Calcium Salts may diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Calcium Channel Blockers: May enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Cefpodoxime: Antacids may decrease the serum concentration of Cefpodoxime. *Risk C: Monitor therapy*

Cefuroxime: Antacids may decrease the serum concentration of Cefuroxime. *Risk C: Monitor therapy*

Corticosteroids (Oral): Antacids may decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

CycloSPORINE: Antacids may decrease the serum concentration of CycloSPORINE. Specifically when cyclosporine is administered orally. *Risk C: Monitor therapy*

Dabigatran Etexilate: Antacids may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Antacids may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Delavirdine: Antacids may decrease the absorption of Delavirdine. *Risk D: Consider therapy modification*

DOBUTamine: Calcium Salts may diminish the therapeutic effect of DOBUTamine. *Risk C: Monitor therapy*

Erlotinib: Antacids may decrease the serum concentration of Erlotinib. Management: Separate the administration of erlotinib and any antacid by several hours in order to minimize the risk of a significant interaction. *Risk D: Consider therapy modification*

Estramustine: Calcium Salts may decrease the absorption of Estramustine. *Risk D: Consider therapy modification*

Fexofenadine: Antacids may decrease the serum concentration of Fexofenadine. Management: No specific recommendations concerning the time required between their administration are provided. Separate administration of each agent by as much time as possible to decrease the risk of an interaction. *Risk D: Consider therapy modification*

Iron Salts: Antacids may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Isoniazid: Antacids may decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Methenamine: Antacids may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Mycophenolate: Antacids may decrease the absorption of Mycophenolate. *Risk D: Consider therapy modification*

Mycophenolate: Magnesium Salts may decrease the absorption of Mycophenolate. This only applies to oral magnesium salts. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Magnesium Salts may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Penicillamine: Antacids may decrease the serum concentration of Penicillamine. *Risk D: Consider therapy modification*

Phosphate Supplements: Antacids may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Phosphate Supplements: Calcium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Phosphate Supplements: Magnesium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Protease Inhibitors: Antacids may decrease the absorption of Protease Inhibitors. **Exceptions:** Darunavir. *Risk C: Monitor therapy*

QuiNIDine: Antacids may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

Quinolone Antibiotics: Antacids may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Calcium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Moxifloxacin. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Magnesium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Sodium Polystyrene Sulfonate: May enhance the adverse/toxic effect of Antacids. The combined use of these two agents may result in metabolic alkalosis. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Antacids may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Magnesium Salts may decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Thiazide Diuretics: May decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Tocainide: Antacids may increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Trientine: Calcium Salts may decrease the serum concentration of Trientine. Trientine may decrease the serum concentration of Calcium Salts. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Magnesium Salts. Magnesium Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gelcap (Mylanta® Gelcaps®): Calcium carbonate 550 mg and magnesium hydroxide 125 mg

Liquid (Mylanta® Supreme): Calcium carbonate 400 mg and magnesium hydroxide 135 mg per 5 mL (360 mL, 720 mL) [cherry flavor]

Tablet, chewable:

Mi-Acid™ Double Strength: Calcium carbonate 700 mg and magnesium hydroxide 300 mg

Mylanta® Ultra: Calcium carbonate 700 mg and magnesium hydroxide 300 mg [cherry créme and cool mint flavors]

Rolaids®: Calcium carbonate 550 mg and magnesium hydroxide 110 mg [sodium free; contains elemental calcium 220 mg and elemental magnesium 45 mg; original (peppermint), cherry, and spearmint flavors]

Rolaids® Extra Strength: Calcium carbonate 675 mg and magnesium hydroxide 135 mg [sodium free; contains elemental calcium 271 mg and elemental magnesium 56 mg, fruit flavor contains tartrazine; cool strawberry, fresh mint, fruit, and tropical fruit punch flavors]

Generic AvailableYes: Chewable tablet

Pricing: U.S. (www.drugstore.com)

Chewable (Mylanta Ultra)

700-300 mg (35): $8.99

700-300 mg (70): $8.99

Canadian Brand NamesApo-Cal®; Calcite-500; Caltrate®; Caltrate® Select; Os-Cal®

Pharmacologic CategoryAntacid; Antidote; Calcium Salt; Electrolyte Supplement, Oral

Use: Labeled IndicationsAs an antacid; treatment and prevention of calcium deficiency or hyperphosphatemia (eg, osteoporosis, osteomalacia, mild/moderate renal insufficiency, hypoparathyroidism, postmenopausal osteoporosis, rickets); has been used to bind phosphate

Dosing: AdultsDosage is in terms of elemental calcium:

Dietary Reference Intake: Oral:

Adults, Male/Female:

19-50 years: 1000 mg/day

≥51 years: 1200 mg/day

Female: Pregnancy/Lactating: Same as for Adults, Male/Female

Hypocalcemia (dose depends on clinical condition and serum calcium level): Oral: Dose expressed in mg of **elemental calcium**: 1-2 g or more/day in 3-4 divided doses

Dietary supplementation: Oral: 500 mg to 2 g divided 2-4 times/day

Antacid: Oral: Dosage based on acid-neutralizing capacity of specific product; generally, 1-2 tablets or 5-10 mL every 2 hours; maximum: 7000 mg calcium carbonate per 24 hours; specific product labeling should be consulted

Osteoporosis: Oral: Adults >51 years: 1200 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDosage is in terms of elemental calcium:

Dietary Reference Intake: Oral:

0-6 months: 210 mg/day

7-12 months: 270 mg/day

1-3 years: 500 mg/day

4-8 years: 800 mg/day

9-19 years: 1300 mg/day

Hypocalcemia (dose depends on clinical condition and serum calcium level): Oral: Dose expressed in mg of **elemental calcium**

Neonates: 50-150 mg/kg/day in 4-6 divided doses; not to exceed 1 g/day

Children: 45-65 mg/kg/day in 4 divided doses

Antacid: Oral:

Children 2-5 years (24-47 lb): Elemental calcium 161 mg as needed; maximum 483 mg per 24 hours

Children 6-11 years (48-95 lb): Elemental calcium 322 mg as needed; maximum: 966 mg per 24 hours

Dosing: Renal ImpairmentCl_{cr} <25 mL/minute: Dosage adjustments may be necessary depending on the serum calcium levels.

Calculations

- Calcium Correction

Dietary ConsiderationsAs a dietary supplement, should be given with meals to increase absorption. May decrease iron absorption, so should be administered 1-2 hours before or after iron supplementation. Limit intake of bran, foods high in oxalates, or whole grain cereals which may decrease calcium absorption.

Maalox® Quick Dissolve 600 mg tablet contains phenylalanine 0.5 mg/tablet.

Tums® Extra Strength Sugar Free 750 mg tablet contains phenylalanine <1 mg/tablet.

Titralac™ 420 mg tablet and Titralac™ Extra Strength 750 mg tablet each contain sodium 1.1 mg/tablet.

Compatibility

Compatibility when admixed: Incompatible: Carbonates, phosphates, sulfates, tartrates.

ContraindicationsHypercalcemia, renal calculi, hypophosphatemia; patients with suspected digoxin toxicity

Warnings/Precautions

Concerns related to adverse effects:

- Gastrointestinal effects: Constipation, bloating, and gas are common with calcium supplements (especially carbonate salt).

Disease-related concerns:

- Achlorhydria: Calcium absorption is impaired in achlorhydria; administration is followed by increased gastric acid secretion within 2 hours of administration especially with high doses. Common in the elderly, use an alternate salt (eg, citrate) and administer with food.

- Hypoparathyroid disease: Hypercalcemia and hypercalciuria are most likely to occur in hypoparathyroid patients receiving high doses of vitamin D.

- Kidney stones (calcium-containing): Use caution when administering calcium supplements to patients with a history of kidney stones.

Concurrent drug therapy issues:

- Minerals/other oral drugs: Calcium administration interferes with absorption of some minerals and drugs; use with caution.

- Vitamin D: It is recommended to concomitantly administer vitamin D for optimal calcium absorption.

Other warnings/precautions:

- Absorption: Taking calcium (≤500 mg) with food improves absorption.

Pregnancy ConsiderationsAvailable evidence suggests safe use during pregnancy and breast-feeding.

Adverse ReactionsWell tolerated

1% to 10%:

Central nervous system: Headache

Endocrine & metabolic: Hypophosphatemia, hypercalcemia

Gastrointestinal: Constipation, laxative effect, acid rebound, nausea, vomiting, anorexia, abdominal pain, xerostomia, flatulence

Miscellaneous: Milk-alkali syndrome with very high, chronic dosing and/or renal failure (headache, nausea, irritability, and weakness or alkalosis, hypercalcemia, renal impairment)

Drug Interactions

ACE Inhibitors: Antacids may decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Antacids may decrease the absorption of Allopurinol. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists: Antacids may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amphetamines: Antacids may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Antacids may decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Antacids may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): Antacids may decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Atazanavir: Antacids may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Bisacodyl: Antacids may diminish the therapeutic effect of Bisacodyl. Antacids may cause the delayed-release bisacodyl tablets to release drug prior to reaching the large intestine. Gastric irritation and/or cramps may occur. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Calcium Salts may decrease the absorption of Bisphosphonate Derivatives. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Antacids may decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Calcium Salts may diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Cefpodoxime: Antacids may decrease the serum concentration of Cefpodoxime. *Risk C: Monitor therapy*

Cefuroxime: Antacids may decrease the serum concentration of Cefuroxime. *Risk C: Monitor therapy*

Corticosteroids (Oral): Antacids may decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

CycloSPORINE: Antacids may decrease the serum concentration of CycloSPORINE. Specifically when cyclosporine is administered orally. *Risk C: Monitor therapy*

Dabigatran Etexilate: Antacids may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Antacids may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Delavirdine: Antacids may decrease the absorption of Delavirdine. *Risk D: Consider therapy modification*

DOBUTamine: Calcium Salts may diminish the therapeutic effect of DOBUTamine. *Risk C: Monitor therapy*

Erlotinib: Antacids may decrease the serum concentration of Erlotinib. Management: Separate the administration of erlotinib and any antacid by several hours in order to minimize the risk of a significant interaction. *Risk D: Consider therapy modification*

Estramustine: Calcium Salts may decrease the absorption of Estramustine. *Risk D: Consider therapy modification*

Iron Salts: Antacids may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Isoniazid: Antacids may decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Methenamine: Antacids may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Mycophenolate: Antacids may decrease the absorption of Mycophenolate. *Risk D: Consider therapy modification*

Penicillamine: Antacids may decrease the serum concentration of Penicillamine. *Risk D: Consider therapy modification*

Phosphate Supplements: Antacids may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Phosphate Supplements: Calcium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Protease Inhibitors: Antacids may decrease the absorption of Protease Inhibitors. **Exceptions:** Darunavir. *Risk C: Monitor therapy*

QuiNIDine: Antacids may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

Quinolone Antibiotics: Antacids may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Calcium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Moxifloxacin. *Risk D: Consider therapy modification*

Sodium Polystyrene Sulfonate: May enhance the adverse/toxic effect of Antacids. The combined use of these two agents may result in metabolic alkalosis. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Antacids may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Thiazide Diuretics: May decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Tocainide: Antacids may increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Trientine: Calcium Salts may decrease the serum concentration of Trientine. Trientine may decrease the serum concentration of Calcium Salts. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase risk of osteoporosis).

Food: Food may increase calcium absorption. Calcium may decrease iron absorption. Bran, foods high in oxalates, or whole grain cereals may decrease calcium absorption.

Test InteractionsIncreased calcium (S); decreased magnesium

Reference Range

Serum calcium: 8.4-10.2 mg/dL: Monitor plasma calcium levels if using calcium salts as electrolyte supplements for deficiency

Due to a poor correlation between the serum ionized calcium (free) and total serum calcium, particularly in states of low albumin or acid/base imbalances, direct measurement of ionized calcium is recommended

In low albumin states, the corrected **total** serum calcium may be estimated by:

Corrected total calcium = total serum calcium + 0.8 (4.0 - measured serum albumin)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effectiveness, and adverse/toxic effects. Assess knowledge/teach patient proper use, appropriate interventions to reduce side effects, and adverse symptoms to report.

Patient EducationFollow instructions for dosing. Take with a full glass of water or juice 1-2 hours before any iron supplements and 1-3 hours after meals or other medications. Avoid alcohol, other antacids, caffeine, or other calcium supplements, unless approved by prescriber. You may experience constipation (increased exercise, fluids, fiber, or fruit may help) or dry mouth (sucking lozenges or hard candy may help). Report severe, unresolved GI disturbances and unusual emotional liability (mood swings). **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule:

Calci-Mix®: 1250 mg [equivalent to elemental calcium 500 mg]

Florical®: 364 mg [equivalent to elemental calcium 145.6 mg; contains sodium fluoride 3.75 mg]

Gum, chewing: 250 mg (30s)

Chooz®: 500 mg [equivalent to elemental calcium 200 mg; mint flavor]

Powder: 4000 mg/teaspoonful (480 g) [equivalent to 1600 mg elemental calcium/teaspoonful]

Suspension, oral: 1250 mg/5 mL (5 mL, 500 mL) [equivalent to elemental calcium 500 mg/5 mL; mint flavor]

Tablet: 1250 mg [equivalent to elemental calcium 500 mg]; 1500 mg [equivalent to elemental calcium 600 mg]

Calcarb 600, Caltrate® 600, Nephro-Calci®: 1500 mg [equivalent to elemental calcium 600 mg]

Florical®: 364 mg [equivalent to elemental calcium 145.6 mg; contains sodium fluoride 8.3 mg]

Os-Cal® 500: 1250 mg [equivalent to elemental calcium 500 mg; contains tartrazine] [DSC]

Oysco 500, Oyst-Cal 500: 1250 mg [equivalent to elemental calcium 500 mg]

Tablet, chewable: 500 mg [equivalent to elemental calcium 200 mg]; 650 mg [equivalent to elemental calcium 260 mg]; 750 mg [equivalent to elemental calcium 300 mg]

Alcalak: 420 mg [equivalent to elemental calcium 168 mg; mint flavor]

Alka-Mints®: 850 mg [equivalent to elemental calcium 340 mg; spearmint flavor]

Cal-Gest: 500 mg [equivalent to elemental calcium 200 mg; assorted flavors]

Calci-Chew®: 1250 mg [equivalent to elemental calcium 500 mg; cherry, lemon, and orange flavors]

Cal-Mint: 650 mg [equivalent to elemental calcium 260 mg; mint flavor]

Children's Pepto: 400 mg [equivalent to elemental calcium 161 mg; bubble gum or watermelon flavors]

Maalox® Regular: 600 mg [equivalent to elemental calcium 222 mg; contains phenylalanine 0.5 mg/tablet; lemon flavor]

Mylanta® Children's: 400 mg [equivalent to elemental calcium 160 mg; bubble gum flavor]

Nutralox®: 420 mg [equivalent to elemental calcium 168 mg; sugar free; mint flavor]

Os-Cal® 500: 1250 mg [equivalent to elemental calcium 500 mg; Bavarian cream flavor] [DSC]

Titralac™: 420 mg [equivalent to elemental calcium 168 mg; sugar free; contains sodium 1.1 mg/tablet; spearmint flavor]

Tums®: 500 mg [equivalent to elemental calcium 200 mg; contains tartrazine; assorted fruit and peppermint flavors]

Tums® E-X: 750 mg [equivalent to elemental calcium 300 mg; contains tartrazine; assorted fruit, cool relief mint, fresh blend, tropical assorted fruit, wintergreen, and assorted berry flavors]

Tums® Extra Strength Sugar Free: 750 mg [equivalent to elemental calcium 300 mg; sugar free; contains phenylalanine <1 mg/tablet; orange cream flavor]

Tums® Smoothies™: 750 mg [equivalent to elemental calcium 300 mg; contains tartrazine; assorted fruit, assorted tropical fruit, peppermint flavors]

Tums® Ultra®: 1000 mg [equivalent to elemental calcium 400 mg; contains tartrazine; assorted berry, assorted fruit, assorted tropical fruit, peppermint, and spearmint flavors]

Tablet, softchew:

Rolaids®: 1177 mg [equivalent to elemental calcium 471 mg; contains coconut oil and soy lecithin; vanilla creme and wild cherry flavors]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Chewable (Childrens Mylanta)

400 mg (24): $8.99

Suspension (Calcium Carbonate)

1250 mg/5 mL (500): $11.00

Tablets (Calcium Carbonate)

648 mg (100): $0.75

Tablets (Caltrate 600)

1500 mg (60): $14.99

Tablets (Oyst-Cal)

500 mg (120): $8.99

Mechanism of ActionAs dietary supplement, used to prevent or treat negative calcium balance; in osteoporosis, it helps to prevent or decrease the rate of bone loss. The calcium in calcium salts moderates nerve and muscle performance and allows normal cardiac function. Also used to treat hyperphosphatemia in patients with advanced renal insufficiency by combining with dietary phosphate to form insoluble calcium phosphate, which is excreted in feces. Calcium salts as antacids neutralize gastric acidity resulting in increased gastric and duodenal bulb pH; they additionally inhibit proteolytic activity of peptic if the pH is increased >4 and increase lower esophageal sphincter tone.

Pharmacodynamics/Kinetics

Absorption: Requires vitamin D; minimal unless chronic, high doses are given; calcium is absorbed in soluble, ionized form; solubility of calcium is increased in an acid environment

Distribution: Crosses placenta; enters breast milk

Excretion: Primarily feces (as unabsorbed calcium); urine (20%)

Pharmacotherapy Pearls20 mEq calcium/g; 400 mg elemental calcium/g calcium carbonate (40% elemental calcium)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely produce irritability

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsHypercalcemia is evident on ECG by shortening of the QT interval and possibly lengthening of the PR interval. Hypocalcemia causes prolongation of the QT interval. This prolongation is due to lengthening of the ST segment; the T waves remain unchanged. However, in severe hypocalcemia, T waves may be inverted. Note that only hypocalcemia and hypothermia lengthen the ST segment without altering T-wave duration. Hypocalcemia may also present clinically with skeletal muscle spasm.

Calcium salts may enhance the arrhythmogenic effects of digoxin. Part of the inotropic action of digoxin appears to be associated with increased intracellular calcium availability. Chronotropic effects are also calcium mediated. The administration of exogenous calcium (especially by parenteral routes) can lead to cardiac arrhythmias.

Calcium Chloride

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Medication Safety Issues

Dosing issues:

Calcium chloride may be confused with calcium gluconate

Confusion with the different intravenous salt forms of calcium has occurred. There is a threefold difference in the primary cation concentration between calcium chloride (in which 1g = 13.6 mEq [270 mg] of elemental Ca++) and calcium gluconate (in which 1g = 4.65 mEq [90 mg] of elemental Ca++).

Prescribers should specify which salt form is desired. Dosages should be expressed either as mEq, mg, or grams of the salt form.

Pronunciation(KAL see um KLOR ide)

Pharmacologic CategoryCalcium Salt; Electrolyte Supplement, Parenteral

Use: Labeled IndicationsTreatment of acute symptomatic hypocalcemia; cardiac disturbances of hyperkalemia or hypocalcemia; emergent treatment of hypocalcemic tetany; treatment of severe hypermagnesemia

Use: Unlabeled/InvestigationalCalcium channel blocker overdose; severe hyperkalemia (K+ >7 mEq/L with toxic ECG changes) [ACLS guidelines]; malignant arrhythmias associated with hypermagnesemia [ACLS guidelines]

Dosing: Adults**Note:** One gram of calcium chloride is equal to 270 mg of elemental calcium.

Dosages are expressed in terms of the calcium chloride salt based on a solution concentration of 100 mg/mL (10%) containing 1.4 mEq (27.3 mg)/mL elemental calcium.

Acute, symptomatic ionized hypocalcemia, hyperkalemia, or magnesium toxicity:Note: Routine use in cardiac arrest is not recommended due to the lack of improved survival [ACLS 2005 Guidelines]: I.V.: 500-1000 mg, may repeat as necessary

Calcium channel blocker overdose (unlabeled use):

I.V.: 1000 mg every 10-20 minutes (total of 4 doses) **or** 1000 mg every 2-3 minutes until clinical effect is achieved; if favorable response obtained, consider I.V. infusion

I.V. infusion: 20-50 mg/kg/hour

Hypocalcemia secondary to citrated blood transfusion: I.V.: 200-500 mg per 500 mL of citrated blood (infused into another vein)

Note: Routine administration of calcium, in the absence of signs/symptoms of hypocalcemia, is generally not recommended. A number of recommendations have been published seeking to address potential hypocalcemia during massive transfusion of citrated blood; however, many practitioners recommend replacement only as guided by clinical evidence of hypocalcemia and/or serial monitoring of ionized calcium. In adults, clinically-significant hypocalcemia usually dose not occur until >5 units of packed red blood cells have been administered.

Hypocalcemic tetany: I.V.: 1000 mg over 10-30 minutes; may repeat after 6 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** One gram of calcium chloride is equal to 270 mg of elemental calcium.

Dosages are expressed in terms of the calcium chloride salt based on a solution concentration of 100 mg/mL (10%) containing 1.4 mEq (27.3 mg)/mL elemental calcium.

Acute, symptomatic ionized hypocalcemia, hyperkalemia, or magnesium toxicity:Note: Routine use in cardiac arrest is not recommended due to the lack of improved survival [PALS 2005 Guidelines]: I.V.:

Neonates: 20 mg/kg; may repeat as necessary

Infants and Children: 20 mg/kg; may repeat as necessary [PALS 2005 Guidelines]

Calcium channel blocker overdose (unlabeled use): Neonates, Infants, and Children [PALS 2005 Guidelines]:

I.V., I.O.: 20 mg/kg (maximum: 1000 mg/dose) over 5-10 minutes; if favorable response obtained, consider I.V. infusion

I.V. infusion: 20-50 mg/kg/hour

Hypocalcemic tetany: I.V.:

Neonates: 40-60 mg/kg/dose repeated every 6-8 hours

Infants and Children: 10 mg/kg over 5-10 minutes; may repeat after 6-8 hours or follow with an infusion with a maximum dose of 200 mg/kg/day; alternatively, higher doses of 35-50 mg/kg/dose repeated every 6-8 hours have been used

Hypocalcemia secondary to citrated blood transfusion: I.V.: Neonates, Infants, and Children: Give 32 mg (0.45 mEq elemental calcium) for each 100 mL citrated blood infused

Note: Routine administration of calcium, in the absence of signs/symptoms of hypocalcemia, is generally not recommended. A number of recommendations have been published seeking to address potential hypocalcemia during massive transfusion of citrated blood; however, many practitioners recommend replacement only as guided by clinical evidence of hypocalcemia and/or serial monitoring of ionized calcium.

Dosing: Renal ImpairmentCl_{cr} <25 mL/minute: Dosage adjustments may be necessary depending on the serum calcium levels.

Calculations

- Calcium Correction

Administration: I.V.For I.V. administration only; avoid extravasation. Avoid rapid administration (do not exceed 100 mg/minute). May be given over 2-5 minutes if rapid increase in serum calcium concentration is required. For I.V. infusion, dilute to a maximum concentration of 20 mg/mL and infuse over 1 hour or no greater than 45-90 mg/kg/hour (0.6-1.2 mEq/kg/hour); administration via a central or deep vein is preferred; do not use scalp, small hand or foot veins for I.V. administration since severe necrosis and sloughing may occur. Monitor ECG if calcium is infused faster than 2.5 mEq/minute; **stop the infusion if the patient complains of pain or discomfort.** Warm to body temperature. **Do not infuse calcium chloride in the same I.V. line as phosphate-containing solutions**.

StorageDo not refrigerate solutions; IVPB solutions/I.V. infusion solutions are stable for 24 hours at room temperature.

Although calcium chloride is not routinely used in the preparation of parenteral nutrition, it is important to note that phosphate salts may precipitate when mixed with calcium salts. Solubility is improved in amino acid parenteral nutrition solutions. Check with a pharmacist to determine compatibility.

CompatibilityStable in most common intravenous infusion solutions; **variable stability (consult detailed reference)** in fat emulsion 10%.

Y-site administration: Compatible: Amiodarone, dobutamine, epinephrine, esmolol, gatifloxacin, inamrinone, milrinone, morphine, paclitaxel, sodium nitroprusside. **Incompatible:** Amphotericin B cholesteryl sulfate complex, ceftriaxone, propofol, sodium bicarbonate.

Compatibility in syringe: Compatible: Milrinone. **Incompatible:** Pantoprazole.

Compatibility when admixed: Compatible: Amikacin, ascorbic acid injection, chloramphenicol, dopamine, hydrocortisone sodium succinate, isoproterenol, lidocaine, norepinephrine, penicillin G potassium, penicillin G sodium, pentobarbital, phenobarbital, sodium bicarbonate, verapamil, vitamin B complex with C. **Incompatible:** Amphotericin B, chlorpheniramine, pantoprazole. **Variable (consult detailed reference):** Dobutamine, potassium phosphate.

ContraindicationsHypercalcemia, known or suspected digoxin toxicity; not recommended as routine treatment in cardiac arrest (includes asystole, ventricular fibrillation, pulseless ventricular tachycardia, or pulseless electrical activity)

Warnings/Precautions

Disease-related concerns:

- Acidosis: Use with caution in patients with respiratory acidosis, renal impairment, or respiratory failure; acidifying effect of calcium chloride may potentiate acidosis.

- Hyperphosphatemia: Use with caution in patients with severe hyperphosphatemia as elevated levels of phosphorus and calcium may result in soft tissue and pulmonary arterial calcium-phosphate precipitation.

- Hypokalemia: Use with caution in patients with severe hypokalemia as acute rises in serum calcium levels may result in life-threatening cardiac arrhythmias.

- Renal impairment: Use with caution in patients with chronic renal failure to avoid hypercalcemia; frequent monitoring of serum calcium and phosphorus is necessary.

Concurrent drug therapy issues:

- Digoxin: Use with caution in digitalized patients; hypercalcemia may precipitate cardiac arrhythmias.

Dosage form specific issues:

- Aluminum: Solutions may contain aluminum; toxic levels may occur following prolonged administration in premature neonates or patients with renal impairment.

Other warnings/precautions:

- Duration of use: Avoid metabolic acidosis (ie, administer only 2-3 days then change to another calcium salt).

- I.V. administration: For I.V. use only; do not inject SubQ or I.M. Avoid rapid I.V. administration (do not exceed 100 mg/minute). May be given over 2-5 minutes if rapid increase in serum calcium concentrations are required. Avoid extravasation.

Geriatric ConsiderationsWhen using in the elderly, check albumin status and make appropriate decisions concerning reference serum concentrations. Elderly, especially the ill, often have low albumin due to malnutrition.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined. I.V.:

Cardiovascular: Arrhythmia, bradycardia, cardiac arrest, hypotension, syncope, vasodilation

Endocrine & metabolic: Hypercalcemia

Gastrointestinal: Irritation, chalky taste

Hepatic: Elevated serum amylase

Neuromuscular & skeletal: Tingling sensation

Renal: Renal calculi

Miscellaneous: Hot flashes

Postmarketing and/or case reports: Calcinosis cutis

Drug Interactions

Bisphosphonate Derivatives: Calcium Salts may decrease the absorption of Bisphosphonate Derivatives. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Calcium Salts may diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CefTRIAXone: Calcium Salts (Intravenous) may enhance the adverse/toxic effect of CefTRIAXone. Ceftriaxone binds to calcium forming an insoluble precipitate. *Risk X: Avoid combination*

DOBUTamine: Calcium Salts may diminish the therapeutic effect of DOBUTamine. *Risk C: Monitor therapy*

Phosphate Supplements: Calcium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Thiazide Diuretics: May decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Trientine: Calcium Salts may decrease the serum concentration of Trientine. Trientine may decrease the serum concentration of Calcium Salts. *Risk D: Consider therapy modification*

Test Interactions Increased calcium

Monitoring Parameters Monitor infusion site, ECG when appropriate; serum calcium and ionized calcium (normal: 8.5-10.2 mg/dL [total]; 4.5-5.0 mg/dL [ionized]), albumin, serum phosphate

Reference Range

Serum calcium: 8.4-10.2 mg/dL

Due to a poor correlation between the serum ionized calcium (free) and total serum calcium, particularly in states of low albumin or acid/base imbalances, direct measurement of ionized calcium is recommended.

In low albumin states, the corrected **total** serum calcium may be estimated by the following equation (assuming a normal albumin of 4 g/dL).

Corrected total calcium = total serum calcium + 0.8 (4.0 - measured serum albumin)

or

Corrected calcium = measured calcium - measured albumin + 4.0

Serum/plasma chloride: 95-108 mEq/L

Nursing: Physical Assessment/Monitoring Assess other medications or herbal/natural products the patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effect, and adverse/toxic effects. Infusion site should be monitored closely to prevent extravasation (see Administration).

Monitoring: Lab Tests Serum calcium and ionized calcium (normal: 8.5-10.2 mg/dL [total]; 4.5-5.0 mg/dL [ionized]), albumin, serum phosphate

Patient Education This medication can only be given intravenously. Do not make rapid postural changes while calcium is infusing. Report any feelings of excitation, chest pain, irregular or pounding heartbeat, vomiting, acute headache, or dizziness.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 10% (10 mL) [present as calcium chloride 100 mg (1.36 mEq)/mL; provides elemental calcium 27.2 mg/mL (1.36 mEq)/mL]

Injection, solution: 10% (10 mL) [present as calcium chloride 100 mg (1.36 mEq)/mL; provides elemental calcium 27.2 mg (1.36 mEq)/mL]

Generic Available Yes

Mechanism of Action Moderates nerve and muscle performance via action potential excitation threshold regulation

Pharmacodynamics/Kinetics

Distribution: Crosses placenta; enters breast milk

Excretion: Primarily feces (80% as insoluble calcium); urine (20%)

Pharmacotherapy Pearls 14 mEq calcium/g (10 mL); 270 mg elemental calcium/g calcium chloride (27% elemental calcium)

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause drowsiness; rare reports of mania

Mental Health: Effects on Psychiatric Treatment None reported

Cardiovascular Considerations Hypercalcemia is evident on ECG by shortening of the QT interval and possibly lengthening of the PR interval. Hypocalcemia causes prolongation of the QT interval. This prolongation is due to lengthening of the ST segment; the T waves remain unchanged. However, in severe hypocalcemia, T waves may be inverted. Note that only hypocalcemia and hypothermia lengthen the ST segment without altering T-wave duration. Hypocalcemia may also present clinically with skeletal muscle spasm.

Calcium salts may enhance the arrhythmogenic effects of digoxin. Part of the inotropic action of digoxin appears to be associated with increased intracellular calcium availability. Chronotropic effects are also calcium mediated. The administration of exogenous calcium (especially by parenteral routes) can lead to cardiac arrhythmias.

Cardiac Arrest: According to the 2005 American Heart Association Guidelines for Cardiopulmonary Resuscitation and Emergency Cardiovascular Care, routine use in cardiac arrest is not recommended due to lack of improved survival. However, in patients with acute, symptomatic hypocalcemia (total serum calcium concentration <8.5 mg/dL [or ionized calcium <4.2 mg/dL; <1 mmol/L], hyperkalemia with associated ECG changes, or magnesium toxicity, the use of intravenous calcium chloride may be helpful and is recommended.

Anesthesia and Critical Care Concerns/Other Considerations

Hypocalcemia in the Critically-Ill Patient: Treatment of patients with asymptomatic hypocalcemia, defined as a total serum calcium concentration <8.5 mg/dL (or ionized calcium <4.2 mg/dL; <1 mmol/L) with intravenous calcium salts is generally not recommended. Symptoms usually occur when ionized calcium levels fall to <2.5 mg/dL. Symptoms include paresthesias of the extremities and face, muscle cramps, carpopedal spasm, stridor, tetany, and seizures. However, if the patient is experiencing hemodynamic compromise or life-threatening arrhythmias with any degree of hypocalcemia, treatment with intravenous calcium is warranted. Use of calcium chloride is preferred due to the higher bioavailability as compared with calcium gluconate. If the patient has concomitant hypomagnesemia, replacement with calcium may be ineffective. It is recommended that serum magnesium levels be corrected prior to administration of calcium.

Calcium Channel Blocker (CCB) Overdose: Effects of CCB overdose vary depending on the type ingested. Dihydropyridine CCBs (eg, nifedipine) exhibit peripheral vasodilation primarily although if large amounts are ingested, effects on the AV node may be seen. Nondihydropyridine CCBs (eg, verapamil) exhibit negative inotropic, chronotropic, and dromotropic actions although if large amounts are ingested, peripheral vasodilation effects may be present.

Calcium chloride may be an effective treatment for the CCB overdose. In addition to the use of calcium chloride, other successful treatments include high-dose insulin with supplemental dextrose and potassium (HDIDK therapy), beta$_1$/alpha$_1$-agonists (eg, dopamine), and glucagon may be used.

Medication Safety Issues

Sound-alike/look-alike issues:

Citracal® may be confused with Citrucel®

Pronunciation(KAL see um SIT rate)
U.S. Brand NamesCal-C-Caps [OTC]; Cal-Cee [OTC]; Cal-Citrate-225; Cal-Citrate® 250 [OTC] [DSC]; Citracal® Kosher [OTC]
Canadian Brand NamesOsteocit®
Pharmacologic CategoryCalcium Salt
Use: Labeled IndicationsAntacid; treatment and prevention of calcium deficiency or hyperphosphatemia (eg, osteoporosis, osteomalacia, mild/moderate renal insufficiency, hypoparathyroidism, postmenopausal osteoporosis, rickets)
Dosing: AdultsOral: Dosage is in terms of elemental calcium

Dietary Reference Intake:

Adults, Male/Female:

19-50 years: 1000 mg/day

≥51 years: 1200 mg/day

Female: Pregnancy/Lactating: Same as for Adults, Male/Female

Dietary supplement: Oral: Usual dose: 500 mg to 2 g 2-4 times/day

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricOral: Dosage is in terms of elemental calcium

Dietary Reference Intake:

0-6 months: 210 mg/day

7-12 months: 270 mg/day

1-3 years: 500 mg/day

4-8 years: 800 mg/day

9-18 years: 1300 mg/day

ContraindicationsHypersensitivity to any component of the formulation; hypercalcemia, renal calculi, ventricular fibrillation
Warnings/Precautions

Concerns related to adverse effects:

- Gastrointestinal effects: Constipation, bloating, and gas are common with calcium supplements (especially carbonate salt).

Disease-related concerns:

- Achlorhydria: Calcium absorption is impaired in achlorhydria; common in elderly. Citrate may be preferred because better absorbed.

- Hypoparathyroid disease: Hypercalcemia and hypercalciuria are most likely to occur in hypoparathyroid patients receiving high doses of vitamin D.

- Kidney stones (calcium-containing): Use caution when administering calcium supplements to patients with a history of kidney stones.

- Renal impairment: Use with caution in patients with renal failure to avoid hypercalcemia; frequent monitoring of serum calcium and phosphorus is necessary.

Concurrent drug therapy issues:

- Minerals/other oral drugs: Calcium administration interferes with absorption of some minerals and drugs; use with caution.

- Vitamin D: It is recommended to concomitantly administer vitamin D for optimal calcium absorption.

Other warnings/precautions:

- Absorption: Taking calcium (≤500 mg) with food improves absorption.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined:

Mild hypercalcemia (calcium: >10.5 mg/dL) may be asymptomatic or manifest itself as constipation, anorexia, nausea, and vomiting

More severe hypercalcemia (calcium: >12 mg/dL) is associated with confusion, delirium, stupor, and coma

Central nervous system: Headache

Endocrine & metabolic: Hypophosphatemia, hypercalcemia

Gastrointestinal: Nausea, anorexia, vomiting, abdominal pain, constipation

Miscellaneous: Thirst

Drug Interactions

Aluminum Hydroxide: Citric Acid Derivatives may increase the absorption of Aluminum Hydroxide. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Calcium Salts may decrease the absorption of Bisphosphonate Derivatives. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Calcium Salts may diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

DOBUTamine: Calcium Salts may diminish the therapeutic effect of DOBUTamine. *Risk C: Monitor therapy*

Estramustine: Calcium Salts may decrease the absorption of Estramustine. *Risk D: Consider therapy modification*

Phosphate Supplements: Calcium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Calcium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Moxifloxacin. *Risk D: Consider therapy modification*

Thiazide Diuretics: May decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Trientine: Calcium Salts may decrease the serum concentration of Trientine. Trientine may decrease the serum concentration of Calcium Salts. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase risk of osteoporosis).

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess therapeutic effect and adverse/toxic effects. Assess knowledge/teach patient proper use, appropriate interventions to reduce side effects, and adverse symptoms to report.

Patient EducationInform prescriber of any other medications or dietary supplements you are taking. Do not take any new medication during therapy without consulting prescriber. Follow exact instructions for dosing. Take with a full glass of water or juice, 1-3 hours after other medications, and 1-2 hours before any approved iron supplements. Avoid alcohol, other antacids, caffeine, or other calcium supplements unless approved by prescriber. May cause constipation (increased exercise, fluids, fiber, or fruits may help) or dry mouth (frequent mouth care, chewing gum, or sucking lozenges may help). Report severe, unresolved GI disturbances and unusual emotional lability (mood swings). **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule:

Cal-C-Caps: Elemental calcium 180 mg

Cal-Citrate-225: Elemental calcium 225 mg

Granules: Elemental calcium 760 mg/teaspoonful (480 g)

Tablet: Elemental calcium 200 mg, 250 mg

Cal-Citrate®: Elemental calcium 250 mg [DSC]

Cal-Cee: Elemental calcium 250 mg

Citracal® Kosher: Elemental calcium 200 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Citracal)

950 mg (200): $15.00

Mechanism of ActionModerates nerve and muscle performance via action potential excitation threshold regulation

Pharmacodynamics/KineticsAbsorption: Requires vitamin D

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause confusion and delirium (as a consequence of hypercalcemia)

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular Considerations Hypercalcemia is evident on ECG by shortening of the QT interval and possibly lengthening of the PR interval. Hypocalcemia causes prolongation of the QT interval. This prolongation is due to lengthening of the ST segment; the T waves remain unchanged. However, in severe hypocalcemia, T waves may be inverted. Note that only hypocalcemia and hypothermia lengthen the ST segment without altering T-wave duration. Hypocalcemia may also present clinically with skeletal muscle spasm.

Calcium Glubionate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Calcium glubionate may be confused with calcium gluconate

Pronunciation(KAL see um gloo BYE oh nate)

U.S. Brand NamesCalcionate [OTC]

Pharmacologic CategoryCalcium Salt

Use: Labeled IndicationsDietary supplement

Dosing: AdultsDosage is in terms of **elemental** calcium

Dietary Reference Intake:

Adults, Male/Female:

19-50 years: 1000 mg/day

≥51 years: 1200 mg/day

Female: Pregnancy/Lactating: Same as for Adults, Male/Female

Dietary supplement: Oral: 1 tablespoonful 3 times a day

Pregnant or lactating women: 1 tablespoonful 4 times a day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDosage is in terms of **elemental** calcium

Dietary Reference Intake:

0-6 months: 210 mg/day

7-12 months: 270 mg/day

1-3 years: 500 mg/day

4-8 years: 800 mg/day

9-18 years: 1300 mg/day

Dietary supplement: Oral:

Infants <12 months: 1 teaspoonful 5 times a day; may mix with juice or formula

Children <4 years: 2 teaspoonsful 3 times a day

Children ≥4 years: Refer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <25 mL/minute: Dosage adjustments may be necessary depending on the serum calcium levels.

Administration: OralTake with a full glass of water or juice, 1-3 hours after meals and other medications, and 1-2 hours before any approved iron supplements.

Dietary ConsiderationsShould be taken before meals to enhance absorption. May decrease iron absorption so should be administered 1-2 hours before or after iron supplementation. Limit intake of bran, foods high in oxalates, or whole grain cereals which may decrease calcium absorption.

ContraindicationsHypersensitivity to any component of the formulation; renal calculi

Warnings/Precautions

Concerns related to adverse effects:

- Gastrointestinal effects: Constipation, bloating, and gas are common with calcium supplements (especially carbonate salt).

Disease-related concerns:

- Achlorhydria: Calcium absorption is impaired in achlorhydria; common in elderly, use an alternate salt (eg, citrate) and administer with food.
- Hypoparathyroid disease: Hypercalcemia and hypercalciuria are most likely to occur in hypoparathyroid patients receiving high doses of

vitamin D.

- Kidney stones (calcium-containing): Use caution when administering calcium supplements to patients with a history of kidney stones.

Concurrent drug therapy issues:

- Minerals/other oral drugs: Calcium administration interferes with absorption of some minerals and drugs; use with caution.

- Vitamin D: It is recommended to concomitantly administer vitamin D for optimal calcium absorption.

Other warnings/precautions:

- Absorption: Taking calcium (≤500 mg) with food improves absorption.

Adverse Reactions

Frequency not defined; symptoms reported with hypercalcemia:

Gastrointestinal: Abdominal pain, anorexia, constipation, nausea, thirst, vomiting, xerostomia

Genitourinary: Polyuria

Drug Interactions

Bisphosphonate Derivatives: Calcium Salts may decrease the absorption of Bisphosphonate Derivatives. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Calcium Salts may diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

DOBUTamine: Calcium Salts may diminish the therapeutic effect of DOBUTamine. *Risk C: Monitor therapy*

Estramustine: Calcium Salts may decrease the absorption of Estramustine. *Risk D: Consider therapy modification*

Phosphate Supplements: Calcium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Calcium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Moxifloxacin. *Risk D: Consider therapy modification*

Thiazide Diuretics: May decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Trientine: Calcium Salts may decrease the serum concentration of Trientine. Trientine may decrease the serum concentration of Calcium Salts. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase risk of osteoporosis).

Food: Food may increase calcium absorption. Calcium may decrease iron absorption. Bran, foods high in oxalates, or whole grain cereals may decrease calcium absorption.

Test Interactions

Decreased magnesium

Reference Range

Serum calcium: 8.4-10.2 mg/dL: Monitor plasma calcium levels if using calcium salts as electrolyte supplements for deficiency.

Due to a poor correlation between the serum ionized calcium (free) and total serum calcium, particularly in states of low albumin or acid/base imbalances, direct measurement of ionized calcium is recommended.

In low albumin states, the corrected **total** serum calcium may be estimated by:

Corrected total calcium = total serum calcium + 0.8 (4.0 - measured serum albumin)

Patient Education

Do not take any new medication during therapy without consulting prescriber. Follow exact instructions for dosing. Take with a full glass of water or juice, 1-3 hours after meals and other medications, and 1-2 hours before any approved iron supplements. Avoid alcohol, other antacids, caffeine, or other calcium supplements unless approved by prescriber. May cause constipation (increased exercise, fluids, fiber, or fruits may help) or dry mouth (frequent mouth care, chewing gum, or sucking lozenges may help). Report severe, unresolved GI disturbances and unusual emotional lability (mood swings). **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Syrup:

Calcionate: 1.8 g/5 mL (480 mL) [equivalent to elemental calcium 115 mg/5 mL; contains benzoic acid; caramel and orange flavor]

Generic Available

Yes

Mechanism of Action

As dietary supplement, used to prevent or treat negative calcium balance. The calcium in calcium salts moderates nerve and muscle performance and allows normal cardiac function.

Pharmacodynamics/Kinetics

Absorption: Requires vitamin D; calcium is absorbed in soluble, ionized form; solubility of calcium is increased in an acid environment

Distribution: Crosses placenta; enters breast milk

Excretion: Primarily feces (as unabsorbed calcium); urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause confusion and delirium (as a consequence of hypercalcemia)
Mental Health: Effects on Psychiatric TreatmentNone reported
Cardiovascular ConsiderationsHypercalcemia is evident on ECG by shortening of the QT interval and possibly lengthening of the PR interval. Hypocalcemia causes prolongation of the QT interval. This prolongation is due to lengthening of the ST segment; the T waves remain unchanged. However, in severe hypocalcemia, T waves may be inverted. Note that only hypocalcemia and hypothermia lengthen the ST segment without altering T-wave duration. Hypocalcemia may also present clinically with skeletal muscle spasm.

Calcium Gluconate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Calcium gluconate may be confused with calcium glubionate

Pronunciation(KAL see um GLOO koe nate)

U.S. Brand NamesCal-G [OTC]; Cal-GLU™

Pharmacologic CategoryCalcium Salt; Electrolyte Supplement, Oral; Electrolyte Supplement, Parenteral

Use: Labeled IndicationsTreatment and prevention of hypocalcemia; treatment of tetany, cardiac disturbances of hyperkalemia, cardiac resuscitation when epinephrine fails to improve myocardial contractions, hypocalcemia; calcium supplementation; hydrofluoric acid (HF) burns

Use: Unlabeled/InvestigationalCalcium channel blocker overdose

Dosing: Adults

Adequate Intake (as elemental calcium):

Adults, Male/Female:

19-50 years: 1000 mg/day

≥51 years: 1200 mg/day

Female: Pregnancy/Lactating: Same as for Adults, Male/Female

Dosage note: Calcium chloride has 3 times more elemental calcium than calcium gluconate. Calcium chloride is 27% elemental calcium; calcium gluconate is 9% elemental calcium. One gram of calcium chloride is equal to 270 mg of elemental calcium; 1 gram of calcium gluconate is equal to 90 mg of elemental calcium. The following dosages are expressed in terms of the calcium gluconate salt based on a solution concentration of 100 mg/mL (10%) containing 0.465 mEq (9.3 mg)/mL elemental calcium:

Hypocalcemia:

I.V.: 2-15 g/24 hours as a continuous infusion or in divided doses

Oral: 500 mg to 2 g 2-4 times/day

Hypocalcemia secondary to citrated blood infusion: I.V.: 500 mg to 1 g per 500 mL of citrated blood (infused into another vein). Single doses up to 2 g have also been recommended.

Note: Routine administration of calcium, in the absence of signs/symptoms of hypocalcemia, is generally not recommended. A number of recommendations have been published seeking to address potential hypocalcemia during massive transfusion of citrated blood; however, many practitioners recommend replacement only as guided by clinical evidence of hypocalcemia and/or serial monitoring of ionized calcium.

Hypocalcemic tetany: I.V.: 1-3 g/dose may be administered until therapeutic response occurs

Magnesium intoxication or cardiac arrest in the presence of hyperkalemia or hypocalcemia: I.V.: 500-800 mg/dose (maximum: 3 g/dose)

Maintenance electrolyte requirements for TPN: I.V.: Daily requirements: 1.7-3.4 g/1000 kcal/24 hours

Calcium channel blocker overdose (unlabeled use): I.V. infusion: 10% solution: 0.6-1.2 mL/kg/hour or I.V. 0.2-0.5 ml/kg every 15-20 minutes for 4 doses (maximum: 2-3 g/dose). In life-threatening situations, 1 g has been given every 1-10 minutes until clinical effect is achieved (case reports of resistant hypotension reported use of 12-18 g total).

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Adequate Intake (as elemental calcium):

0-6 months: 210 mg/day

7-12 months: 270 mg/day

1-3 years: 500 mg/day

4-8 years: 800 mg/day

9-18 years: 1300 mg/day

Dosage note: Calcium chloride has 3 times more elemental calcium than calcium gluconate. Calcium chloride is 27% elemental calcium; calcium gluconate is (9% elemental calcium). One gram of calcium chloride is equal to 270 mg of elemental calcium; 1 gram of calcium gluconate is equal to 90 mg of elemental calcium. The following dosages are expressed in terms of the calcium gluconate salt based on a solution concentration of 100 mg/mL (10%) containing 0.465 mEq (9.3 mg)/mL elemental calcium:

Hypocalcemia:

I.V.:

Neonates: 200-800 mg/kg/day as a continuous infusion or in 4 divided doses (maximum: 1 g/dose)

Infants and Children: 200-500 mg/kg/day as a continuous infusion or in 4 divided doses (maximum: 2-3 g/dose)

Oral: Children: 200-500 mg/kg/day divided every 6 hours

Hypocalcemia secondary to citrated blood infusion: I.V.: Neonates, Infants, and Children: Give 98 mg (0.45 mEq **elemental** calcium) for each 100 mL citrated blood infused.

Note: Routine administration of calcium, in the absence of signs/symptoms of hypocalcemia, is generally not recommended. A number of recommendations have been published seeking to address potential hypocalcemia during massive transfusion of citrated blood; however, many practitioners recommend replacement only as guided by clinical evidence of hypocalcemia and/or serial monitoring of ionized calcium.

Hypocalcemic tetany: I.V.: Infants and Children: 100-200 mg/kg/dose over 5-10 minutes; may repeat every 6-8 hours **or** follow with an infusion of 500 mg/kg/day

Magnesium intoxication or cardiac arrest in the presence of hyperkalemia or hypocalcemia: I.V.: Infants and Children: 60-100 mg/kg/dose (maximum: 3 g/dose)

Dosing: Renal ImpairmentCl_{cr} <25 mL/minute: Dosage adjustments may be necessary depending on the serum calcium levels.

Calculations

- Calcium Correction

Administration: I.M.Not for I.M. or SubQ administration

Administration: I.V.For I.V. administration only; administer slowly (~1.5 mL calcium gluconate 10% per minute) through a small needle into a large vein in order to avoid too rapid increased in serum calcium and extravasation

Administration: OtherNot for SubQ administration.

Storage

Do not refrigerate solutions. IVPB solutions/I.V. infusion solutions are stable for 24 hours at room temperature.

Standard diluent: 1 g/100 mL D_5W or NS; 2 g/100 mL D_5W or NS.

Maximum concentration in parenteral nutrition solutions is variable depending upon concentration and solubility (consult detailed reference).

CompatibilityStable in D_5LR, D_5NS, D_5W, $D_{10}W$, $D_{20}W$, LR, NS; **incompatible** in fat emulsion 10%.

Y-site administration: Compatible: Aldesleukin, allopurinol, amifostine, aztreonam, cefazolin, cefepime, ciprofloxacin, cisatracurium, cladribine, dobutamine, docetaxel, doxorubicin liposome, enalaprilat, epinephrine, etoposide, famotidine, filgrastim, gatifloxacin, gemcitabine, granisetron, heparin with hydrocortisone sodium succinate, labetalol, linezolid, melphalan, midazolam, milrinone, piperacillin/tazobactam, potassium chloride, prochlorperazine edisylate, propofol, remifentanil, sargramostim, tacrolimus, teniposide, thiotepa, tolazoline, vinorelbine, vitamin B complex with C. **Incompatible:** Amphotericin B cholesteryl sulfate complex, fluconazole, indomethacin. **Variable (consult detailed reference):** Ampicillin, meropenem.

Compatibility in syringe: Incompatible: Metoclopramide.

Compatibility when admixed: Compatible: Amikacin, aminophylline, ascorbic acid injection, bretylium, chloramphenicol, corticotropin, dimenhydrinate, furosemide, heparin, hydrocortisone sodium succinate, lidocaine, magnesium sulfate, norepinephrine, penicillin G potassium, penicillin G sodium, phenobarbital, potassium chloride, tobramycin, vancomycin, verapamil, vitamin B complex with C. **Incompatible:** Amphotericin B, cefamandole, cefazolin, clindamycin, dobutamine, floxacillin, methylprednisolone sodium succinate. **Variable (consult detailed reference):** Folic acid, potassium phosphate, prochlorperazine edisylate, sodium bicarbonate; maximum concentration in parenteral nutrition solutions is variable depending upon concentration and solubility.

Extemporaneously PreparedTo make calcium gluconate gel, 3.5 g of calcium gluconate can be added to 5 oz tube of a surgical lubricant (water soluble such as K-Y® Jelly).

ContraindicationsHypersensitivity to calcium gluconate or any component of the formulation; ventricular fibrillation during cardiac resuscitation; digitalis toxicity or suspected digoxin toxicity; hypercalcemia

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac arrest: May produce cardiac arrest.

- Gastrointestinal effects: Constipation, bloating, and gas are common with oral calcium supplements (especially carbonate salt).

Disease-related concerns:

- Acidosis: Use with caution in patients with respiratory acidosis, renal impairment, or respiratory failure; acidifying effect of calcium chloride may potentiate acidosis.

- Hyperphosphatemia: Use with caution in patients with severe hyperphosphatemia.

- Kidney stones (calcium-containing): Use caution when administering calcium supplements to patients with a history of kidney stones.

- Renal impairment: Use with caution in patients with renal failure to avoid hypercalcemia; frequent monitoring of serum calcium and phosphorus is necessary.

Concurrent drug therapy issues:

- Digitalis: Use with caution in digitalized patients; hypercalcemia may precipitate cardiac arrhythmias.

- Minerals/other oral drugs: Calcium administration interferes with absorption of some minerals and drugs; use with caution.

- Vitamin D: It is recommended to concomitantly administer vitamin D for optimal calcium absorption.

Dosage form specific issues:

- Absorption: Taking oral calcium (≤500 mg) with food improves absorption.

- Aluminum: Solutions may contain aluminum; toxic levels may occur following prolonged administration in premature neonates or patients with renal impairment.

- I.V. administration: For I.V. use only; do not inject SubQ or I.M. Avoid too rapid I.V. administration and avoid extravasation.

Geriatric ConsiderationsConstipation and gas can be significant in elderly, but are usually mild.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been completed.
LactationEnters breast milk
Breast-Feeding ConsiderationsEndogenous calcium is excreted in breast milk.
Adverse ReactionsFrequency not defined.

I.V.:

Cardiovascular: Arrhythmia, bradycardia, cardiac arrest, hypotension, vasodilation, and syncope may occur following rapid I.V. injection

Central nervous system: Sense of oppression

Gastrointestinal: Chalky taste

Local: Abscess and necrosis following I.M. administration

Neuromuscular & skeletal: Tingling sensation

Miscellaneous: Heat waves

Postmarketing and/or case reports: Calcinosis cutis

Oral: Gastrointestinal: Constipation

Drug Interactions

Bisphosphonate Derivatives: Calcium Salts may decrease the absorption of Bisphosphonate Derivatives. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Calcium Salts may diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CefTRIAXone: Calcium Salts (Intravenous) may enhance the adverse/toxic effect of CefTRIAXone. Ceftriaxone binds to calcium forming an insoluble precipitate. *Risk X: Avoid combination*

DOBUTamine: Calcium Salts may diminish the therapeutic effect of DOBUTamine. *Risk C: Monitor therapy*

Estramustine: Calcium Salts may decrease the absorption of Estramustine. *Risk D: Consider therapy modification*

Phosphate Supplements: Calcium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Calcium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Moxifloxacin. *Risk D: Consider therapy modification*

Thiazide Diuretics: May decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Trientine: Calcium Salts may decrease the serum concentration of Trientine. Trientine may decrease the serum concentration of Calcium Salts. *Risk D: Consider therapy modification*

Test InteractionsIncreased calcium (S); decreased magnesium
Reference Range

Serum calcium: 8.4-10.2 mg/dL: Monitor plasma calcium levels if using calcium salts as electrolyte supplements for deficiency

Due to a poor correlation between the serum ionized calcium (free) and total serum calcium, particularly in states of low albumin or acid/base imbalances, direct measurement of ionized calcium is recommended

In low albumin states, the corrected **total** serum calcium may be estimated by: Corrected total calcium = total serum calcium + 0.8 (4.0 - measured serum albumin)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effect, and adverse/toxic effects. Assess knowledge/teach patient proper use, appropriate interventions to reduce side effects, and adverse symptoms to report. If administered I.V., monitor ECG, vital signs, and CNS. Observe infusion site closely. Avoid extravasation.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Follow exact instructions for dosing. Oral: Take with a full glass of water or juice, 1-3 hours after other medications, and 1-2 hours before any approved iron supplements. Avoid alcohol, other antacids, caffeine, or other calcium supplements unless approved by prescriber. May cause constipation (increased exercise, fluids, fiber, or fruits may help) or dry mouth (frequent mouth care, chewing gum, or sucking lozenges may help). Report severe, unresolved GI disturbances and unusual emotional lability (mood swings). **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, oral:

Cal-G: 700 mg [gluten free, wheat free; equivalent to elemental calcium 65 mg]

Capsule, oral [preservative free]:

Cal-GLU™: 515 mg [dye free, sugar free; equivalent to elemental calcium 50 mg]

Injection, solution [preservative free]: 10% (10 mL, 50 mL, 100 mL, 200 mL) [100 mg/mL; equivalent to elemental calcium 9 mg/mL; calcium 0.46 mEq/mL]

Powder: 347 mg/tablespoonful (480 g)

Tablet: 500 mg [equivalent to elemental calcium 45 mg]; 650 mg [equivalent to elemental calcium 58.5 mg]; 975 mg [equivalent to elemental calcium 87.75 mg]

Generic AvailableYes

Mechanism of ActionAs dietary supplement, used to prevent or treat negative calcium balance; in osteoporosis, it helps to prevent or decrease the rate of bone loss. The calcium in calcium salts moderates nerve and muscle performance and allows normal cardiac function.

Pharmacodynamics/Kinetics

Absorption: Requires vitamin D; calcium is absorbed in soluble, ionized form; solubility of calcium is increased in an acid environment

Distribution: Primarily in bones and teeth; crosses placenta; enters breast milk

Protein binding: Primarily albumin

Excretion: Primarily feces (as unabsorbed calcium); urine (20%)

Pharmacotherapy PearlsA topical 2.5% to 5% calcium gel for the treatment of hydrofluoric acid (HF) burns can be prepared by adding calcium gluconate to a surgical lubricant (water soluble such as K-Y® Jelly). Calcium chloride should not be used for this purpose. Use of injectable calcium gluconate (I.V., SubQ) has also been reported in the literature for the treatment of HF burns not amenable to topical treatment.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness; may cause confusion and delirium (as a consequence of hypercalcemia)

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsHypercalcemia is evident on ECG by shortening of the QT interval and possibly lengthening of the PR interval. Hypocalcemia causes prolongation of the QT interval. This prolongation is due to lengthening of the ST segment; the T waves remain unchanged. However, in severe hypocalcemia, T waves may be inverted. Note that only hypocalcemia and hypothermia lengthen the ST segment without altering T-wave duration. Hypocalcemia may also present clinically with skeletal muscle spasm.

Calcium salts may enhance the arrhythmogenic effects of digoxin. Part of the inotropic action of digoxin appears to be associated with increased intracellular calcium availability. Chronotropic effects are also calcium mediated. The administration of exogenous calcium (especially by parenteral routes) can lead to cardiac arrhythmias.

Anesthesia and Critical Care Concerns/Other Considerations

Hypocalcemia in the Critically-Ill Patient: Treatment of patients with asymptomatic hypocalcemia, defined as a total serum calcium concentration <8.5 mg/dL (or ionized calcium <4.2 mg/dL; <1 mmol/L) with intravenous calcium salts is generally not recommended. Symptoms usually occur when ionized calcium levels fall to <2.5 mg/dL. Symptoms include paresthesias of the extremities and face, muscle cramps, carpopedal spasm, stridor, tetany, and seizures. However, if the patient is experiencing hemodynamic compromise or life-threatening arrhythmias with any degree of hypocalcemia, treatment with intravenous calcium is warranted. Use of calcium chloride is preferred due to the higher bioavailability as compared with calcium gluconate. If the patient has concomitant hypomagnesemia, replacement with calcium may be ineffective. It is recommended that serum magnesium levels be corrected prior to administration of calcium.

Calcium Lactate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(KAL see um LAK tate)

Pharmacologic Category[Calcium Salt]

Use: Labeled IndicationsAdjunct in prevention of postmenopausal osteoporosis; treatment and prevention of calcium depletion

Dosing: AdultsDosage in terms of calcium lactate

Dietary Reference Intake (in terms of elemental calcium):

Adults, Male/Female:

19-50 years: 1000 mg/day

≥51 years: 1200 mg/day

Female: Pregnancy/Lactating: Same as Adults, Male/Female

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricOral (in terms of calcium lactate):

Dietary Reference Intake (in terms of elemental calcium):

0-6 months: 210 mg/day

7-12 months: 270 mg/day

1-3 years: 500 mg/day

4-8 years: 800 mg/day

9-18 years: 1300 mg/day

Dosing: Renal ImpairmentCl_{cr} <25 mL/minute: Dosage adjustments may be necessary depending on the serum calcium levels.

Warnings/Precautions

Concerns related to adverse effects:

- Gastrointestinal effects: Constipation, bloating, and gas are common with calcium supplements (especially carbonate salt).

Disease-related concerns:

- Achlorhydria: Calcium absorption is impaired in achlorhydria; common in elderly, use an alternate salt (eg, citrate) and administer with food.
- Hypoparathyroid disease: Hypercalcemia and hypercalciuria are most likely to occur in hypoparathyroid patients receiving high doses of vitamin D.
- Kidney stones (calcium-containing): Use caution when administering calcium supplements to patients with a history of kidney stones.
- Renal impairment: Use with caution in patients with renal failure to avoid hypercalcemia; frequent monitoring of serum calcium and phosphorus is necessary.

Concurrent drug therapy issues:

- Minerals/other oral drugs: Calcium administration interferes with absorption of some minerals and drugs; use with caution.
- Vitamin D: It is recommended to concomitantly administer vitamin D for optimal calcium absorption.

Other warnings/precautions:

- Absorption: Taking calcium (≤500 mg) with food improves absorption.

Pregnancy Risk FactorC

Adverse Reactions<1%: Constipation, dizziness, dry mouth, headache, hypercalcemia, hypercalciuria, hypomagnesemia, hypophosphatemia, mental confusion, milk-alkali syndrome, nausea, vomiting

Drug Interactions

Bisphosphonate Derivatives: Calcium Salts may decrease the absorption of Bisphosphonate Derivatives. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Calcium Salts may diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

DOBUTamine: Calcium Salts may diminish the therapeutic effect of DOBUTamine. *Risk C: Monitor therapy*

Estramustine: Calcium Salts may decrease the absorption of Estramustine. *Risk D: Consider therapy modification*

Phosphate Supplements: Calcium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Calcium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Moxifloxacin. *Risk D: Consider therapy modification*

Thiazide Diuretics: May decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Trientine: Calcium Salts may decrease the serum concentration of Trientine. Trientine may decrease the serum concentration of Calcium Salts. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase risk of osteoporosis).

Patient EducationDo not take any new medication during therapy without consulting prescriber. Follow exact instructions for dosing. Take with a full glass of water or juice, 1-3 hours after other medications, and 1-2 hours before any approved iron supplements. Avoid alcohol, other antacids, caffeine, or other calcium supplements unless approved by prescriber. May cause constipation (increased exercise, fluids, fiber, or fruits may help) or dry mouth (frequent mouth care, chewing gum, or sucking lozenges may help). Report severe, unresolved GI disturbances and unusual emotional lability (mood swings). **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 650 mg [equivalent to elemental calcium 84.5 mg]

Generic AvailableYes

Mechanism of ActionAs dietary supplement, used to prevent or treat negative calcium balance; in osteoporosis, it helps to prevent or decrease the rate of bone loss. The calcium in calcium salts moderates nerve and muscle performance and allows normal cardiac function.

Pharmacodynamics/KineticsAbsorption: Requires vitamin D

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause confusion or dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsHypercalcemia is evident on ECG by shortening of the QT interval and possibly lengthening of the PR interval. Hypocalcemia causes prolongation of the QT interval. This prolongation is due to lengthening of the ST segment; the T waves remain unchanged. However, in severe hypocalcemia, T waves may be inverted. Note that only hypocalcemia and hypothermia lengthen the ST segment without altering T-wave duration. Hypocalcemia may also present clinically with skeletal muscle spasm.
